Tomatoes Ready for the Home Canner

It Pays to Grow Tomatoes for the Market When Prices are Good, but the Market is Wonderfully Inconsiderate and Prices are Not Always Good When the Crops Are. The Home Canner Gives Relief from the Squeeze of the Commission Man.

BRENTWOOD IRRIGATED FARMS

"Best in the West"

No better dairy farms in all California. Alfalfa and dairying on Brentwood Irrigated Farms bring large and certain returns.

Brentwood Irrigated Farms are located east of Mt. Diablo in Eastern Contra Costa County on the Southern Pacific railroad. The Santa Fe is about five miles distant. Water transportation about four miles from the east line of the property.

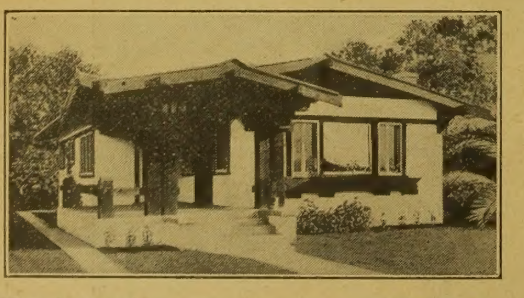
Within 60 miles are the million people of the San Francisco Bay district—a market for everything you will raise, including fruits and vegetables as well as dairy, poulty and pork products.

A complete irrigation system of the highest and best type of construction.

Practically every known California product can be grown here.

Prices, $300 an acre including water right. Write for illustrated pamphlet.

Balfour, Guthrie & Co., 350 California Street, San Francisco
A. Burness, Resident Agent, Brentwood, Calif.



Egyptian Stucco Bungalows

The Greatest Bungalow Book Ever Published

The latest ideas in Bungalows! Half-tone photos, floor plans and Interior Details. Your money back if not satisfied. Send 50c coin or stamps to

THORPE ENGRAVING CO.,

HOME MADE ACETYLENE
Safest Light and Cooking Fuel

Insurance records prove it

IN GRAY DRUMS WITH BLUE BANDS

Insurance records show this—the misuse and abuse of city gas, kerosene and gasoline caused over 100,000 fires in six months. While the misuse and abuse of acetylene caused but four fires during the same period. And there are over a quarter of a million COUNTRY-HOME-ACETYLENE-PLANTS in use. A mighty fine showing for acetylene.

A hundred feet of acetylene makes more light than a thousand feet of city gas. For this reason acetylene light burners have small openings — so small that not enough gas could escape from an open burner — in a whole day — to do any harm whatever.

Also, acetylene gas is not poisonous to breathe — you would suffer no harm in sleeping under an open unlighted burner. Also, acetylene burns with no odor whatever — but acetylene from an unlighted burner has a strong pungent odor which immediately attracts attention.

Also, acetylene lights are permanently fastened to walls and ceilings — they cannot be tipped over.

Also, the acetylene producing stone, UNION CARBIDE, won't burn and can't explode.

For these reasons insurance authorities have pronounced acetylene safer than illuminants it is displacing.

Our advertising literature tells all about the best way to make acetylene for country home use, and how it is used extensively for cooking as well as lighting. Just address—

Home Canning at Pine Crest Ranch

Address by Mrs. Stanley Roberts of Grass Valley Before State Fruit Growers Convention at Davis

At the recent state fruit growers' convention most intense interest was manifested in the addresses and demonstrations touching upon the disposal of fruit and vegetables in such a way as to bring the producer the greatest return. The home canning demonstrations conducted by Mr. William V. Cruess and Mr. Justo P. Zavalla were followed by interested listeners, but none created greater interest than Mrs. Roberts, who gave a description of her work with the home-made canner. Mrs. Roberts came to this country from Hawaii some years ago and for a few years has been on a little ranch in Grass Valley, Nevada County. One of the embarrassing problems which confront the producer is the disposal of fruit at satisfactory prices. Mrs. Roberts conceived the idea of canning the surplus stock of her little ranch and shipping to her old friends in Hawaii. Many who heard her talk wondered at this because the Hawaiian Islands are supposed to be great fruit producers, but peaches, pears and many smaller fruits are not produced there in quantity, and never of the quality which California produces, so ready sale was found for all she could put up. Her means were too limited to permit of buying a canning outfit, but with the assistance of a tinner she contrived a cooking apparatus which just fitted the top of her stove. The size of this was 18 by 22 inches, and it held 20 number 2½ cans. She invested in cans and the necessary utensils for the first year's work, the total expenditure for the outfit being $7.50. This exhausted her means so that she was unable to secure labels for her cans, but she did provide herself with a small rubber stamp for each variety of fruit. This was rather crude, but her friends found the contents of the cans of such quality that they forgot the label. The soldering was also somewhat of a problem, but the trick was soon learned and ultimately the desired professional look was obtained. The total output of the little plant when crowded to the limit was 300 cans per day. This year orders are already coming for more of Mrs. Roberts' product. Prosperity is increasing, for instead of the rubber stamp, she has this year a neatly printed label for each variety of fruit. She hopes this year's returns will justify her plans for an attractive lithographed label for her output of 1915. We mention these details as an encouragement to the disheartened ones who feel that they have not the money to buy the regular canners which are put up in prices ranging from $5 to $1000. A start may be made with home-made appliances, regarding which other articles in this issue of the Cultivator give information. But as to Mrs. Roberts' methods here is her own story as read at the convention:

* * *

Two years ago I realized that my help was needed in the poultry plant that had been established on our ranch and its yearly increase in the number of fowls was making an increased demand on my time and strength. I could not give the outdoor work the attention it needed without slighting my housework, and this clashing of duties led me to see that I must devise some way of securing help and release from housework. So I set myself to studying the problem of ways and means. It did not take me long to decide upon the way. It was home-canning of selected fruits. But that meant a market, and to work up a market time would be needed, and I did not have time to waste. So I set myself to working out the problem of means. After weeks spent in thought and study I received my inspiration. Hawaii, my birthplace, I could surely find a market there.

Acting upon this new thought I sat down and wrote to a number of my island friends, telling them of my project, and in two or three weeks I began to receive answers and orders. My market was assured for that season.

It was necessary to decide upon a canning outfit. We had sent for catalogues and had studied them carefully. I had also talked with the manager of our local cannery and received much valuable information, but to purchase the outfit necessary for our purpose was beyond our means. So we set to work and designed one that we felt would meet our immediate necessity. The design was submitted to one of our hardware firms and their estimate was so reasonable I gave them my order. I mention this fact because I wish people to know that home-canning on a commercial scale can be installed at a small cost, and we have demonstrated that our canner will answer our purpose for two or three years to come. Last season one order called for 800 24-ounce cans of canned fruit and a small order of jams and sweet pickles put up in glass jars. When the fruit was wrapped in home-stamped wrappers and packed and hauled we found that the freight bill called for 1800 pounds. This year I have advertised more extensively. Besides the personal note, I have added a neatly printed circular and order sheet, which gives the variety and names of fruits used, cost of each variety packed in case lots, amount desired, name and address of the party ordering. This order sheet will be mailed to me, kept on file and filled. This order sheet gives my patrons a choice of the varieties named and the number of each variety desired, and it gives me an idea of how much fruit will be needed for the season's output.

Secure Biggest Returns by Home Canning

Home Canning Methods Described by Justo P. Zavalla in Address and Demonstration Before State Fruit Growers Convention

The different operations involved in the process of canning can be divided as follows:

Preparation of the raw material, canning, syruping and preparation of the syrups, capping, exhausting, tipping, cooking, cooling, testing for leaks, lacquering, storage, labeling.

These operations have to be discussed briefly and in a simple manner, so as to give a clear understanding of the influence that they exert in the process of canning.

Preparation of Raw Material.

When the canning of the fruits is to be done on a large scale, that is to say, when the amount of fruit to be canned cannot be obtained from the canner's orchard, then it is necessary to buy fruit outside. In all cases the fruit should be of the best quality if high commercial grades are to be obtained.

In the preparation of the raw material it has to be sorted as follows: First, according to size of fruit, large, medium, small; second, according to ripeness of fruit, green, medium, overripened; third, according to appearance, sound, blemished.

In order to accomplish this operation the help should be furnished with wooden boxes or any other thing suited for that purpose in which to put the sorted fruit.

This operation is one of the most important features of the different steps of canning, and great care should be taken in order to be sure that they have been done in the best way. If any of the mentioned operations is neglected troubles will arise and the succeeding manipulations will be greatly hampered.

With these general principles in mind, we will now describe the different processes of preparation to which the various fruits are submitted before they are canned.

Apricots and peaches should be cut in halves, pitted and classified as follows: Green, medium, soft, pie, blemished. Green fruit, this fruit is not perfectly ripe, but is of good size and sound. Medium fruit, fruit of an ordinary size, sound and sometimes larger and in good condition of ripeness. The greatest portion of canned fruit belongs to this grade. Soft fruit, this fruit is also of good size, and sound, but shows a greater degree of ripeness. Pie fruit, this fruit is overripened and should be used for pie making or the cheaper grades of fruit. Blemished fruit, in this sort of fruit we find all degrees of ripeness. This is not sound fruit, and is generally placed in what is called gallon pie can fruit, and placed in what is termed the "pie grade." After this operation comes the peeling which can be done by hand or by the use of a 10 per cent solution of caustic soda. The temperature of the water should be kept at the boiling point, and the fruit should be submitted to the action of this solution from 30 to 40 seconds, depending on the conditions of the fruit and the excess lye removed immediately by washing. When peeling by hand the Pomona peeling knife is generally used and also the Carmichael pitting spoon. In all cases after the fruit has been peeled it should be carefully washed before it is sent to the canning tables.

Cherries, grapes, strawberries, raspberries, blackberries, etc., must be stemmed and classified according to

what has been already mentioned.

Plums have to be sorted according to size, appearance, degree of maturity and perfection of washing. Cherries and grapes are sometimes pitted, cherries by machine and grapes by hand.

Pears have to be cut in halves, lengthwise, peeled, cored, and classified according to size. In case sliced grades of peaches and apricots are to be prepared, this operation can be done by hand, using a well sharpened knife.

Canning.

The next important operation is the filling of the cans, which is done by hand and according to standard weights, depending on the size of the cans.

Table of Grades and Syrups Used in Canning.

Fruit	Syrup for Spec. Extras	Syrup for Extras	Syrup for Extra Stands	Syrup for Stands	Syrup for Seconds
Apricots	50%	40%	30%	20%	10%
Peaches	50%	40%	30%	20%	10%
Pears	40%	30%	20%	15%	10%
Cherries	40%	30%	20%	15%	10%
Plums	50%	40%	30%	20%	10%
Grapes	40%	30%	20%	10%	10%
Strawberries	60%	50%	40%	30%	20%

To give a better understanding of the weight of the cans filled with fruit without the syrup, the different grades and also the number of pieces that each can contains is given in the following table:

PEARS

Grade of Fruit	Weight in oz.	No. of Pieces	Size of Cans
S. Extras	23½ to 24	8 to 10	2½
Extras	23½ to 24	10 to 12	2½
E. Standards	23½ to 24	12 to 14	2½
Standards	23½ to 24	14 to 18	2½
Seconds	23½ to 24	18 to 22	2½
Pie	24 to 25	.. ..	2½
Water	24 to 25	.. ..	2½
Extras	28 to 30	7 to 11	3
Extras	14 to 16	9 to 14	2
E. Standards	13 to 14	9 to 12	1
Extras	68 to 70	23 to 25	8
E. Standards	68 to 70	40 to 45	8
Pie	80 to 82	.. ..	8
Water	80 to 82	.. ..	8

During the operation of filling the cans plenty of water should be used in order to wash the fruit thoroughly and avoid the browning of the pears when they are left dry. The pieces in the cans should be so arranged as to leave plenty of room for the syrup and also to obtain the required weights.

Special care should be taken in the matter of sorting the fruit before it is put into the cans, in order to obtain a uniform pack. The cans used for canning purposes should be stamped with a simple combination of letters in order to identify the concentration of syrup that should be added and also the length of time that they should be cooked. A previous operation to filling the cans is the washing of them.

Syruping and Preparation of the Syrups.

In general the syrup can be prepared in a tank. The sugar and water may be boiled by a current of steam or by other means. When the foam which appears at the surface of the boiling syrup goes down to the bottom of the tank it is ready to be racked into other tank in which it is diluted to the required gravity. The syrup before being used should be carefully filtered. In this way it will show a bright color and consequently a good appearance in the cans. In the preparation of syrups it is necessary to use a therometer in order to know the temperature of the syrup and the corrections to be made according to the readings registered by the hydrometer. To use the hydrometer fill a glass cylinder with the syrup to be tested and insert the hydrometer. Read the per cent sugar at the surface of the liquid. A Balling hydrometer is best for this purpose. In order to fill the cans with the correct degree of syrup it is necessary to identify the grade of fruit they contain by looking at the combination of letters that we have referred to in a previous paragraph. The temperature of the syrup as well as the Balling must be read to get an accurate idea of the true per cent of sugar. By use of the following rule the temperature correction is easily made.

Temperature Corrections for Sugar Tests of Hot Syrups.

Take sugar per cent by Balling hydrometer and Fahrenheit temperature. Substract 60 from the temperature, multiply by .0490, add this last figure to the sugar per cent shown by the hydrometer. Result is true per cent of sugar. Example: Balling=50 per cent. Temperature=175 per cent. Then the rule is: 175—50=125; 125× .0490=5.1 per cent. 50+5.1=55.1 per cent. Therefore 55.1 per cent is the true reading. This temperature correction is very important and should be made.

Capping.

After the cans have been filled with syrup they are sent through the exhausting boxes in the large canneries where double seaming machines are used for that purpose, but when canning at home this operation is done by hand, and if carefully done there will be no danger of putting the fruit in contact with the acid and lead used. The capping of the cans is very simple, and it only requires a little practice to make a skilful operator. After the caps are put on the cans the soldering fluid should be added with the aid of a little brush, after which the hot capping steel is put over the cap, which melts the lead they contain. If this operation is perfectly well done there will be no leaks. Leaks are to be avoided as they in time will become swells, and therefore result in the loss of the finished product. The vent hole in the center of the cap is left open till after exhausting of the cans.

Exhausting.

This operation has to be done in order to expel the excess of air that the cans contain, which, during the sterilization, will develop a great pressure, the caps of the cans will bulge, and therefore the storage of the cans becomes difficult. The length of time for this operation varies from four to five minutes when the water is at the boiling point. Any tank filled with water of the required capacity can be used for this purpose, provided that the top of the cans should not be covered with water, which otherwise will penetrate the cans and will decrease the commercial value of the products.

Cooking.

After the exhausting operation the cans are tipped and then are ready to be sterilized. Tipping consists in soldering the vent hole with a drop of solder and hot tipping steel. The cooking operation is very important and the final results of the preceding processes of canning depend on the way this operation is accomplished. In general the duration of the sterilizing depends upon ripeness of the fruit. The best system to follow in order to ascertain the length of the cooking is to make a skilful examination of the fruit previous to canning. This is an important fact and should be emphasized. We know that the degree of ripeness of the fruit varies with the methods of cultivation and with the time at which it is gathered. Another way of determining the time that the fruit should be cooked is by processing three or four cans at the same temperature, but during different lengths of time. In this way, by examining the condition of the fruit after cooking, the length of time can be easily ascertained. This operation should be practiced as often as it proves necessary. The following table gives an idea of the temperatures of cooking different fruits:

Time Table

To be followed in the use of the four different types of portable home canners. For altitudes of 4,000 feet or more above sea level, add about 20 per cent or 25 per cent more time to this schedule.

	Size of Cans	Hot Water Outfits at 212° Bath Minutes	Water Outfits Above 212° Seal Minutes	Steam Pressure 5 lbs. or More Cooker Minutes	Cooker 10 lbs. or More Pressure Minutes
Apples	3	15	15	10	6
Apricots	3	15	12	10	6
Asparagus, greens	2 or 3	60	60	40	30
Beans, Lima and String	2 or 3	90	60	60	30
Blackberries, Dewberries	2 or 3	8	8	6	3
Cherries, Peaches	2	15	12	10	5
Corn, without Acids	2	240	180	60	40
Grapes, Pears, Plums	2	15	15	10	6
Peas (field)	2	60	60	40	30
Peas (garden or English)	2	60	60	40	30
Pineapple	2 or 3	30	25	10	10
Raspberries	2 or 3	15	10	6	3
Sauerkraut	3	50	50	40	25
Sweet Potatoes	3	80	70	60	40
Strawberries	3	10	8	6	3
Tomatoes	2 or 3	22	20	10	6
Quince	3	30	25	15	10
Tomato Juice	2	20	20	15	10
Pumpkin	3	50	50	40	30
Figs	3	30	20	10	5
Squash	3	50	40	30	20
Spinach	3	60	60	40	30
Rhubarb	3	25	25	15	10
Beets	3	20	20	15	10

Note—This is a supplement to Farmers' Bulletin No. 521. By following the general instructions of the Bulletin in connection with the time table, you will have the information necessary to do the work of canning all kinds of fruit and vegetables.

(O. H. Benson) U. S. Department of Agriculture.

SYRUPS FOR USE IN CANNING FRUITS

Sugar	Water	Baume Degree	Per Cent Sugar or Balling Degree
1 pint	¼ pt.	40	74
1 pint	½ pt.	32	58
1 pint	1 pt.	24	44
1 pint	1½ pt.	17	31
1 pint	2 pt.	14	25

BRINE FOR VEGETABLES

1 pound salt to 12½ gallons water gives 1% brine.
2 pounds salt to 12½ gallons water gives 2% brine.
3 pounds salt to 12½ gallons water gives 3% brine, etc.

It should be borne in mind that these figures cannot be taken as absolute because they vary widely according to the facts already established. The proper degree of cooking varies with the varieties of fruit under processing. We may illustrate this, taking peaches as a practical example. The proper degree of cooking is recognized when the samples opened show the following characteristics: Uniform color over the whole surface, softened texture within certain limits but should not be too soft. The syrup must be bright without any particles of fruit, especially in the case of high commercial grades.

The proper texture of the fruit can be ascertained by using a spoon with which every piece of fruit under observation should be tested. If the pieces of fruit are penetrated by the spoon with light pressure it will mean that they have received the proper degree of cooking. The same facts should be taken into account in testing other kinds of fruits.

Cooling.

As soon as the cans have been cooked sufficiently they must be quickly cooled in water in order to decrease the action of the temperature on the fruit. The water used for this purpose should be continually renewed because it soon becomes warm.

Testing for Leaks.

After the cans have been cooled, each of them should be tested for leaks. It is very easy to recognize leaky cans, due to the sound that they produce when they are struck with a little piece of wood. In some cases, due to lack of filling the cans, they produce a similar sound to the leaky ones, but it can be distinguished by squeezing them. In the case of leaks they should be separated and sent back to the processing department, where they should be put in a tank containing hot water, but not boiling, in order to place the leaks, which should then be carefully soldered.

Storage.

The cans should be piled in groups according to the quality of fruit they contain. Previous to storage the cans should be lacquered in order to give them a better appearance and also to prevent the tin becoming rusty. Lacquer may be made by dissolving shellac in gasoline.

Labeling.

This operation is easily done by hand. The labels to be used should bear the name of the canner, quality of fruit contained in the cans and also the weight. There are in the market different styles of labels, and it can be said that each brand has its own label.

The handling of the home canning outfits is very simple, and following the instructions given by the various concerns that sell them, good results can be obtained.

Vegetable Canning.

The operations involved in the process of canning vegetables are very simple, and they may be summarized into three general principles: The use of sound raw material, the observation of a very strict hygienic procedure from beginning to end, great care in maintaining the proper temperature while cooking in order that all the micro-organisms that may have accumulated during the handling of the unprocessed raw material will be destroyed. With these purposes in view we will give a brief description of the different manipulations involved in the process of canning tomatoes, asparagus, beans and peas.

Tomatoes.

The first step is to secure a good, sound, raw material which should be thoroughly washed with cold water. After this operation the tomatoes are scalded till the skin becomes loose. The water used for scalding should be kept as clean as possible. The skin of the tomatoes is taken off by hand, and the peeler should at the same time cut off all the decayed or green parts of the tomatoes in order to secure a better looking product. The peelers should be furnished with buckets in which the peelings and peeled tomatoes should be put separately. Next to this operation comes the filling of the cans, which contain from 25 to 28 ounces standard pack cans No. 2½ and from 40 to 42½ ounces solid pack cans No. 3. To obtain those two grades of pack the peeler should classify the tomatoes according to size.

The cans which are supposed to be solid pack must contain nothing else but whole tomatoes with very little tomato juice. After the tomatoes are put in the cans they should be compressed in order to eliminate excess of juice, which gives a bad appearance to the finished product, and at the same time constitutes a fraud. In case of standard pack, tomatoes of smaller size than those used in solid pack are put in the cans which afterwards are refilled with tomato "puree." This tomato juice or "puree" is made of overripened tomatoes which are deprived of the seeds, and the juice is concentrated to a certain extent and cooked with a certain amount of salt. The variety of tomatoes mostly used for canning purposes is called "Red Stone."

Asparagus.

The first operation is the cutting of the stalks according to the length of the cans used for packing. After this the asparagus should be thoroughly

"I found all that I was looking for —in Milford Valley.

Leland S. Bonham

Leland S. Bonham

Milford, Utah, May 27, 1914.

Western Securities Company,
710-712 Hollingsworth Bldg.,
Los Angeles, Cal.

Gentlemen — After spending about $500 studying land conditions throughout California and Arizona, I made a trip to Milford, Utah, and as a result have bought eighty acres of your land. I found conditions there which embraced about everything I had been looking for—fine soil, water, climate and markets, and the crops which I saw growing there convinced me thoroughly that Milford Valley was the place for me.

I can very cheerfully recommend to all my friends who want to find the ideal farm home, as well as a place to make money, that they make a trip to Milford and look it over. Yours truly,

LELAND S. BONHAM.

The above letter from Mr. Bonham, a practical, successful rancher. is only one of many which we have on file in our Los Angeles offices from highly enthusiastic purchasers of land in Milford Valley. These letters are from men who have combed the farming district of the west "with a fine tooth comb" in a search for **the best land for the least money**—the richest soil, the cheapest and most abundant water supply, the best potato and alfalfa land, the best deciduous fruit soil, the highest priced markets, the best social and educational advantages, an invigorating, health-giving climate, pure, soft drinking water, contented, well-to-do neighbors, etc.

On Main Line of Salt Lake Railroad Adjoining Live Town of Milford

Alfalfa (baled) sells today in the town of Milford at $19 per ton. Butter fat brings from 33 to 40 cents per pound the year 'round. Apples command from $2.50 to $3.50 a box. Potatoes bring up to 90 cents a bushel. Hog cholera is unknown in this valley — **during 1913, Utah imported $3,000,000 worth of hog products.**

The early buyers are locating suburban to the rapidly-growing city of Milford — and are easily gaining a $50 an acre advantage over those who later must buy several miles distant from the town.

Prosperous, well-known ranchers from Imperial valley, San Diego, Orange and Riverside counties and the Whittier and Ventura districts have just located on Milford lands. Only the best type of ranchers are locating here—men who know the general farming business and have made money in it.

If you are a shrewd investor **you'll want this land**—you'll surely want it when the people of the valley tell you it will be worth $250 to $300 per acre when in alfalfa. If you are a keen business man you'll want 80 to 160 acres of this land **for your son.** It will give him the opportunity for **success and independence.** Write for our illustrated booklet.

Western Securities Company,
710-712 Hollingsworth Building,

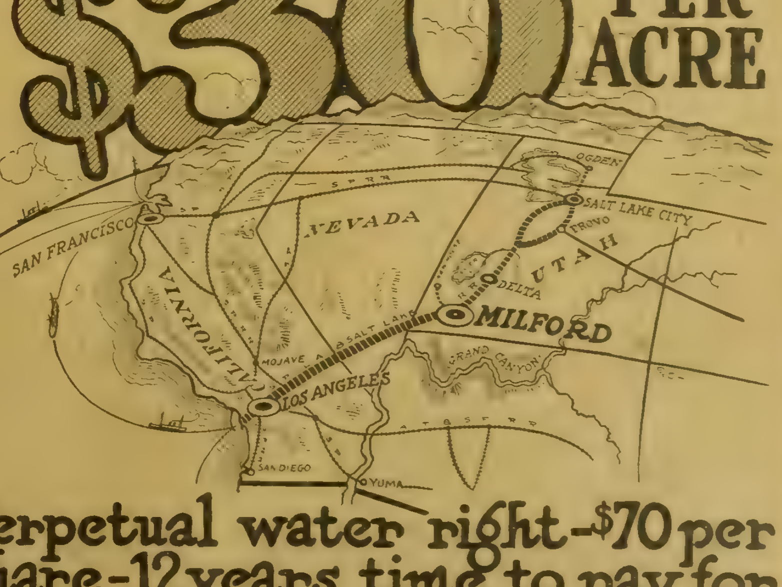
Los Angeles, California.



Perpetual water right-$70 per share-12 years time to pay for it if you desire.

washed in cold water and then blanched in hot water during a period of time that varies with the consistency of the stalks. The sorting of the asparagus has to be done according to the following commercial grades: Giant, mammoth, large, medium and small.

The brine used for filling the cans is prepared by dissolving the desired amount of salt when the water is at the boiling point. The concentration of the brine used in canning asparagus is of two per cent hot solution, which is prepared by adding to 12½ gallons of water two pounds of salt. After the cans have undergone the operations mentioned in connection with canning of fruits and cooked according to the figures given before, they should be cooled right after this operation is done. (See cooking table given under canning of fruits on a previous page; the times and temperatures for vegetables will be found in this table).

Beans.

The beans used for canning purposes should be fresh and not wilted. In case the canning is delayed for one reason or another and the beans are already gathered they can be put in fresh water for a time, which will restore their crispness. The different grades of beans are as follows:

Beans up to 1½ inches in length are No. 1 grade; beans from 1½ inches to 2½ inches, No. 2; from 2½ inches to 3½ inches, No. 3; pods without any seeds showing in them, No. 4; pod with small seeds showing in them, No. 5 grade. The No. 5 grade are cut or broken into four or more pieces. The next operation is the blanching, which is done in the same manner as stated for asparagus, etc., and the length of time varies with the condition of the beans. After the cans are filled with beans a three per cent brine solution is added. Finally they are processed according to the figures given in the table temperatures. In case of string beans they should be stringed, and in all cases thoroughly washed before they are canned.

Peas.

Should be classified according to size and degree of maturity. The tender peas command the higher prices, therefore this sorting should be carefully done. After this the peas have to be blanched in hot water, the length of time varying with the condition of the peas. When blanching the water should be renewed as often as it is possible. When the peas submitted to the blanching operation show a lightly wrinkled surface they are ready to be taken off the bath. In order to classify the peas according to the six standard sizes meshes of six different diameters shauld be used. The diameter of the mesh is as follows: 13/32 inch, 12/32 inch, 11/32 inch, 10/32 inch and 9/32 inch.

The mesh should be shaken so as to facilitate the grading. The mesh with the larger holes is put on the top, and the next underneath, and so on to the smallest in diameter. The cans are filled by hand or machine, and the syrup added, which is one and one-half per cent brine solution, to which two pounds of granulated sugar is added per 12½ gallons. After the cans are cooked they should be cooled immediately (use temperatures given in the cooking table). To secure good success it is necessary to pack the peas when they are fresh and when there is no sign of fermentation. Otherwise the formation of lactic acid begins and the swelling of the cans soon takes place.

* * *

CAUSES OF SPOILING OF CANNED FRUITS AND VEGETABLES

In the presentation of this paper we desire not to discuss this topic from a purely scientific point of view, but we will pay more attention to the practical problems connected with the best methods of canning that should be practiced in order to obtain the most valuable results. At the same time it is our aim also to recommend the most practical ways to be followed to decrease the losses that occur after the fruits and vegetables have been canned.

The operations of canning as performed at home are in all cases easier than those required in a large plant.

If we analyze the different factors that intertwine in the decomposition of canned fruits and vegetables we will find that the most important are:

Unfit raw material, unfit cans and glass jars, carelessness in not having clean fruit, utensils, etc., over-filling cans, carelessness in sealing cans, carelessness in cooking cans.

By unfit, raw material we mean those fruits or vegetables which are partially decomposed. The decomposition of fruits and vegetables is due to the action of very small organisms which can be classed in three groups: Molds, yeasts, bacteria. The effects of these organisms upon the fruits and vegetables become more noticeable when the surrounding temperature conditions favor their growth, and also when the decayed portions are allowed to remain in contact with the sound, raw material.

These facts, considered at their true value, would be sufficient to prove the necessity of making a very careful selection of the raw material before it is canned. This operation is very simple, and it certainly pays to have it done as well as possible, for it will help the canner a great deal in obtaining a better looking product of a long keeping quality. An operation that should be always performed is the blanching of the raw material before it is delivered to the canner. In this way we will greatly improve the appearance of the finished product. The blanching can be done by using a tank filled with hot water or any other thing fitted for that purpose in which the raw material should be submerged for a few minutes with the aid of a basket.

The use of unfit cans and glass jars is a point which every canner must give a great deal of attention. The making of tin cans has improved right along since the beginning up to the present time, and as a result of this improvement we find that one of the greatest achievement of the industry is the making of sanitary enameled cans.

The reason why these cans are called sanitary is none other than that of the use of a very small amount of lead in the sealing operations. The advantages of this may not be doubted. The danger of poisoning due to the action of lead has been minimized to such an extent that now it is of a little consequence. The inspection of the cans before they are sealed is an operation which by no means should be neglected. The time is coming when the machinery used for making the cans will reach such a high state of perfection in the matter of seaming that no allowances will be necessary for leaks due to imperfection on the side seaming of the cans. But as long as this matter remains to be solved the inspection of the cans, to which we referred in a previous paragraph, should be accomplished before the cans are filled with fruit, if saving of money and time is the aim of the canner. The glass jars used in canning should be in all cases free of cracks, which in time will break, due to lack of care in the matter of handling them or to differences in temperature. The rubbers should be new and caps should be sound and well fitting.

One of the most important features of the different steps involved in the operations of canning is hygienic conditions under which the canning of fruits and vegetables is accomplished. The raw material, after it is cut in pieces, for instance, has to be thoroughly washed. In this way we will secure a better looking product, especially when glass jars are used. Besides this, by using water of good quality in the operation of washing the fruit before it is canned, the number of organisms that usually come in contact with the raw material will be decreased, thereby facilitating the preservation of the fruit. Fruit that drops on the floor should never be put in cans before it is washed. The cans and glass jars, before being filled with fruit, should be carefully washed. The tables used for cutting the fruit, and also all the outfit used in the operations of canning, should be kept clean as possible.

The cans and glass jars should be filled with fruit in such a way as to leave plenty of room for the syrup and also to facilitate the sealing of them. If the cans are overfilled the operations of capping are made difficult, especially when it is done by hand. Besides this the danger of putting the fruit in contact with the acid and solder used for sealing is increased.

The operation of sealing the cans is an important one, and the canner should spend a great deal of time to secure a good sealing. When the sealing is done by hand it requires the aid of experienced hands. Otherwise small openings may be left and therefore the action of the sterilizing bath will be of a little value.

The last step in the canning operations is the cooking of the raw material. This operation can be considered as one of the most valuable features of this industry. If the sterilizing process is neglected the whole season's pack will be lost, no matter how carefully the preceding operations have been accomplished. In order to facilitate the cooking of the fruits it is necessary to have it classified according to degree of ripeness. If this is carefully done much of the trouble connected with the cooking is reduced to a minimum. The water used for cooking should always be kept at the boiling point. The length of time the raw material should be cooked depends on the nature of the raw material itself.

It is difficult to try to state definite figures to be used in the process of cooking, for the simple reason that they vary from one day to another. Then the best way to be followed in order to ascertain the right time of cooking is by making several tests during the day's run.

The heat penetrability while cooking the fruit varies with the kind of fruits used, with the length of time, with the temperature of the cooking bath, and finally with the concentration of syrup. By heat penetrability is meant the time required to register at the center of the can the surrounding temperature. The higher the temperature registered at the center of the can after certain period of cooking, the lesser the danger of getting spoiled cans after this operation is done. One of the best methods to follow in order to know when the fruit is thoroughly cooked is by testing the pieces contained in a can. If they show the same appearance in color and also the same degree of hardness it will prove that they have received the right time of cooking. If the fruit has been cooked 13 minutes, and does not show any sign of damage, due to an excess of cooking, it would be advisable to prolong the cooking two or three minutes more, providing this increase in the time of cooking would do no harm to the product. In this way the probability of getting swelled cans, due to under processing, will be less and financial results will be better.

The previous discussion deals with the practical methods of minimizing spoilage. A few words regarding the "germs" that cause spoilage after canning may be of interest.

In general those that occur in spoiled cans of fruits differ from those in spoiled cans of vegetables by being more easily killed by heating. The organisms in spoiled fruit are principally yeasts and molds, all killed below the temperature of boiling water. Those in swelled cans of peas, asparagus, etc., are usually of types of bacteria killed above the boiling point of water, and hence require heating under steam pressure. Their resistance is due to formation of bacterial spores or "seeds," which are very hard to kill. If these are in the cans or on the vegetables, etc., they will multiply in the cans and spoil the contents if the temperature has been insufficient or the time too short.

Fruits contain a great deal of fruit acids that aid in sterilization or killing of the "germs" by heat; vegetables are usually almost free from appreciable amounts of acid, making sterilization for this reason difficult.

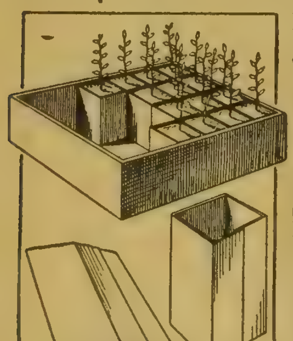
These facts explain why it is necessary to use extra precautions in sterilizing vegetables, and why fruits are easily sterilized. It also explains why spoilage of fruit is usually due to leaks through which yeasts, etc., gain entrance, while swelling is often due, not to leaks, but to growth of bacteria that were sealed up in the cans and survived cooking.

In sterilizing fruit then, one of the principal aims of cooking will be simply to render the fruit palatable and of the proper texture. If this is accomplished at the boiling temperature the yeasts, molds and bacteria of the fruit will be killed. If spoilage then results it is from defective and leaky containers. Vegetables, on the other hand, because of the resistant bacteria spores, must be cooked under pressure, not with the idea of cooking or rendering them palatable, primarily, but with the idea of killing the bacteria that cause swelling and souring. If pressure cookers are not available for vegetables, repeated sterilization at 212 degrees, the boiling point of water, may be used, that is three heatings on three successive days. The time between each heating allows the bacterial spores to sprout, and when young they are very easily killed. Hence if the spores have survived the first heating they will sprout between the first and second heating or second and third, and can them be killed at 212 degrees.

By way of summary it may be stated that spoilage is due chiefly to the action of "germs" or small living organisms that decompose the canned goods. Their activity is favored by the following factors: Unfit or practically spoiled raw material, defective containers, uncleanly methods, overfilling of cans and jars, carelessness in sealing containers, improper temperature or time of cooking. The methods of keeping down spoilage consist in avoiding or controlling the above conditions.

People from the east who come to live in the Sacramento valley must adapt their houses to climatic conditions. A tight box house, with few windows and no screened porches, may be all right in North Dakota, but in this country plenty of screened porches to sleep and eat and live on are essential. It is also important that there be one or two rooms in the middle of the house that can be closed up tight in the morning and kept 10 to 15 degrees cooler than the outside air during the middle of the day.

Collapsible Planting Pots



The only practical and SQUARE POT on the market, packs in FLATS without any loss of space.
For Propagating OLIVE CUTTINGS, EUCALYPTUS, ROSES and PALMS.
THE MOST UP-TO-DATE METHOD FOR PROPAGATING PLANTS, no roots to be cut or torn apart. What's the result? Every plant or tree grows that is raised in these Pots.
For TRUCK GARDENERS, for Early Melons, Tomatoes and Cabbage, etc., they are the thing.
Write for sample and price. We also Manufacture Perforated Tree Protectors. Over three million of them sold last season. Write for sample and price on Pots or Protectors.

HELPS IN CANNING

By Wm. V. Cruess

Publications.

Farmers Bulletin 203, United States department of agriculture; Farmers Bulletin 521, United States department of agriculture; Bulletin 151, United States bureau of chemistry. Bulletins 521 and 203 may be had by writing to Jos. Arnold, editor and chief of division of publications,' Washington, D. C. They are free. Bulletin 151, bureau of chemistry, will be mailed you on sending 10 cents in coin or money order (stamps not accepted) to superintendent of documents, Washington, D. C.

Syrup Gauges.

Balling gauge or hydrometer reads per cent of sugar in a syrup.

Baume scale does not read per cent of sugar, but 1 degree Baume equals 1.8 per cent Balling (approximately), or 1.8 per cent sugar.

Baume	Balling or Per Cent Sugar	Baume	Balling	Baume	Balling
5	8.8	20	35.7	33	60.0
10	17.7	25	44.9	35	63.9
15	26.6	30	54.3	40	73.7

The syrup hydrometers and a 12-inchx1½-inch glass cylinder may be obtained from any chemical supply house for from 50 to 75 cents for the hydrometer and 40 cents for the cylinder. All syrups used in canning fruits should be made according to Balling or Baume test. Jellies should be made so that they will test 50 degrees Balling or 28 degrees Baume, if test is made on the boiling liquid, and 58 degrees Balling or 32 degrees Baume, if made on the cold liquid.

Cans.

"Solder-hemmed" cans are best for home use, as they contain a ring of solder on the top; no extra solder is necessary. "Enamel-lined" cans are best for very acid or highly colored fruits.

No. of Can	Diameter in Inches	Height in Inches	Capacity in Ounces
1	2 11/16	4	11.6
1 Tall	2 11/16	4 1/4	12.3
2	3 3/8	4 9/16	21.3
2 1/2	4	4 3/4	31.2
3	4 3/16	4 7/8	35.0
3 Tall	4 3/16	5 1/2	39.0
10	6 3/32	6 3/16	107.3

DEFINITIONS OF CANNING TERMS

The following definitions will enable the beginner to know the ordinary terms used in canning:

Scalding

To dip fruit in boiling hot water in order to remove the skin.

Blanching

To boil quickly in water by placing the vegetables in a cloth bag, which is to be lowered entirely under water. This is done in order to eliminate acids and bitter substances from the fruit or vegetables.

Exhausting (Sometimes Called "Parboiling")

To boil fruit or vegetables for a few minutes in order to drive out of the fruit and container all gases and surplus air and permit expansion before sealing the venthole. Exhausting is not practiced by all canners, but the writer considers it important, and safer with the many kinds and qualities of fruit and vegetables canned, especially when using the hot water bath outfits at home.

Exhausting causes most fruit to shrink, but swells corn and some vegetables.

Sterilizing

To boil fruit or vegetables for a certain period after the container has been completely sealed. This is sometimes called "processing" or "boiling."

Tinning the Steel

To put the hot steel used for capping cans in sal ammoniac and solder, turning the steel several times until smooth and bright, and then dipping it in soldering "flux."

Capping

Soldering the little solder-hemmed tops on the cans with the capping steel.

Tipping

Closing or sealing the little air hole or vent in the center of the tin cap, just between the exhaust and sterilization periods.

Processing

(Used for "sterilization," "cooking" or "boiling." These expressions all mean the same thing.) To completely destroy all bacteria, spores, germs, etc., in hermetically sealed cans and packages by hot water, steam or steam pressure.

Flux

Soldering flux is prepared by adding to muriatic acid as much zinc as will be dissolved, and then adding water equal in amount to the acid. This fluid is used to clean your steel and for wiping all surfaces to be soldered. By the addition of zinc to the acid, zinc chlorid is formed, and this when applied to the tin adds a coating of zinc, to which the solder will readily adhere.

The flux should be applied carefully and none of it allowed to get inside of the can.

The solder will not adhere to tin without this flux or a similar substitute, such as rosin.

A commercial flux can be secured at a drug store.

Look up the meaning of the following terms in the dictionary: Bacteria, yeast, molds, spores, ferment, germs and microbes.

WORKING WITH PULLEYS AND WHEELS

The modern barn is vastly different from what we had fifteen or twenty years ago, and the work of caring for the stock and handling feed is greatly simplified. Then most of the work was done by muscles; now it is a matter of pulleys and wheels.

The hay forks and carriers, the grain elevators, the feed and litter carriers, all help to make farm work interesting instead of mere drudgery. It was hard work to haul manure out of a cow barn on a wheelbarrow, but it had to be done until we got a litter carrier that runs it out on a cable in half the time and without the heavy work.

Conveniences of this kind are just as important as machinery in the field and serve the same purpose. They have made the farm a more pleasant place to live and work.

SUGGESTIONS FOR HOME AND CLUB CANNING

Any one with ordinary intelligence can make a success of canning tomatoes at home by exercising care in following the instructions given in this bulletin. Common sense, good judgement, and experience will make for success in every way. One's individuality is quite as important as rules and formulas.

All fruits, vegetables, juices, meats, and foodstuffs must be completely sterilized and kept in air-tight containers. Insist upon sanitation. The decay and spoiling of fruit and foodstuffs is due to bacteria, spores, ferment germs, etc. Sterilize and cleanse all containers, vegetables and fruit before proceeding with the work.

Open boilers are less desirable than the closed boiler or steam-pressure outfits, as the heat of the water in them cannot exceed 212 degrees F., and the fruit jars must be kept completely covered with the water, thus requiring more time and labor than with the closed outfits

The hot-water canners with close-fitting covers on the boilers do successful work with the ordinary fruits and some vegetables. They operate with little water and much of the sterilizing is done with live steam in the upper section of the boiler. Some of these boilers carry heat from 212 to 216 degrees F.

Steam-pressure canners are most successful for canning all kinds of vegetables and meats, because the greater heat and pressure effect complete sterilization. Steam under pressure raises the heat to about 250 degreees F. and readily destroys all bacteria and spores in fruit and vegetables. From 5 to 15 pounds pressure to the square inch is used in successful canning work.

Use only fresh fruit and vegetables. and always can fruit the same day it is picked.

Tomatoes should first be dipped in boiling water, then chilled in cold water to make them firmer. They will also pack better.

Let the water come to the boiling point before you lower the fruit into the boiler. Begin to count time for sterilization when the fruit enters the boiling water.

Different varieties and different degrees of ripeness require variation in the length of time given to processing. Soft fruit requires longer boiling than sound fruit. Overripe tomatoes will need to process a few moments longer than if they were just ripened, firm and sound.

Some vegetables contain acids that must be destroyed or eliminated before final processing and sealing. This is usually done by blanching or boiling the vegetables in a weak brine before filling the cans.

Differences in climate, soil and fertilizer make changes in the chemical and physical properties of tomatoes and affect slightly the time required for sterilization.

A FEW ESSENTIALS FOR SUCCESSFUL CANNING

In addition to the canning outfit, the following are essential for efficient work:

A clock in a convenient position where all can see it, and scales graduated from one ounce to 24 pounds.

Plenty of clean wiping cloths for wiping cans, coppers and steels.

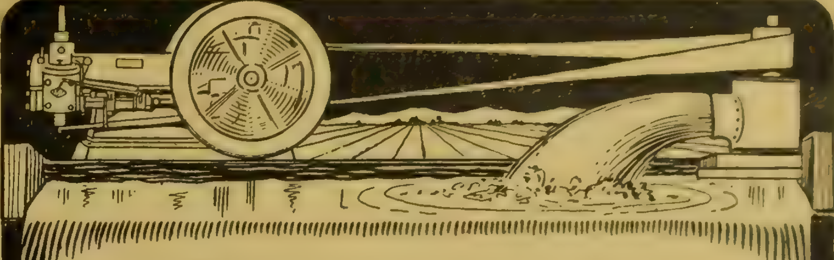
Salt, sugar and plenty of clean, pure water.

A sharp paring knife for each person working; tables, tins, pans or containers, buckets, etc., enough for convenient and efficient work.

The necessary glass jars or a supply of tin cans with solder-hemmed caps and the labels.

Either commercial or home-made soldering flux.

In canning tomatoes it is always advisable to classify your fruit in the following divisions: Extra fine, fine, medium and small. This grading is for convenience in selling. It is well to impress upon the canners the importance of the different sizes of containers; small containers require less time than large ones. A pint can under 15 pounds steam pressure requires about six minutes, and if under five pounds, 15 to 20 minutes. A quart container under 15 pounds of steam requires eight to 12 minutes, and under five pounds of steam, 25 minutes.



THE
Western Gas Engine
Reduces Power Bills, Eliminates Trouble and Gives Constant, Efficient Service

No engine on the market has attained the marvelous success made by the Western Gas Engine here in the West. It is without an equal, whether for heavy irrigation, light ranch work, or other power requirements. The very highest authorities on gas engine construction recommend the Western, because every detail of its construction is correct.

The immense number of Westerns in operation throughout this portion of the country is evincive of their popularity. A Western will save you money and you can absolutely depend upon it at all times.

Many types and sizes from 4 to 180 horse power

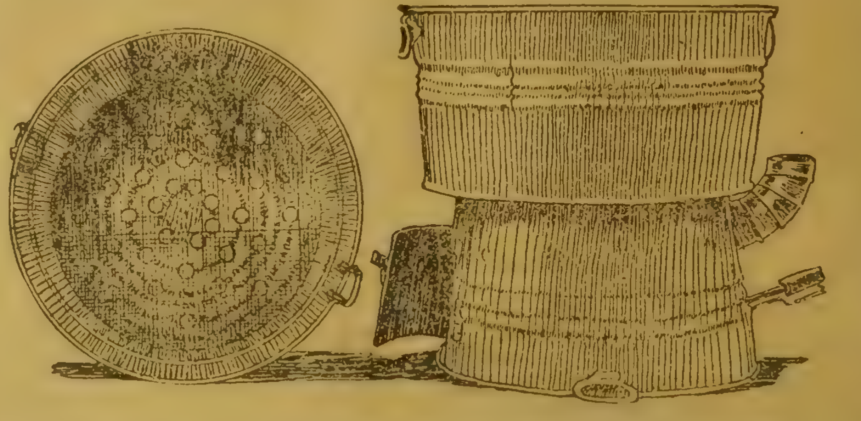
THREE OLD WASHTUBS DO FRESH DUTY

By Emma Chandler, Assistant Federal State Agent of Girls' Canning Clubs in Oklahoma.

Until recently most housewives have used the open kettle method and the glass jar for canning. That is, the tomatoes were cooked in an open porcelain or aluminum kettle and then poured into glass jars. This method has not always proved to be a good one, especially for beginners. It is a slow process and necessitates the worker staying in the warm kitchen all the time the canning process is being carried on. It is not practical if canned tomatoes are to be sold.



The Washtub Canner.

Another kind of a home-made canner that has attracted a great deal of attention on the demonstration trains and at exhibits in Oklahoma is the one made from three galvanized iron tubs, two old ones and one good one. This canner must be used out of doors.

When making a canner it is best to have four parts, a fire box, a vessel which will hold water for sterilizing the material to be canned, a basket for placing the cans in the water and a tight cover.

How to Make It.

When making the tub canner begin with the bottom first and build up. For the fire box use one of the old tubs, cut out the bottom, invert the tub and with a cold chisel cut out a door on one side. Fasten this door in place with wire. Opposite the door and about three to four inches from the bottom make a round opening for the stove pipe. Cut one end of the stovepipe elbow in six or eight equal parts. Bend every other piece half way back. Slip cut end of elbow through the opening in the tub. Bend pieces of elbow on the inside of the tub back against the side of the tub. To this elbow attach one or two joints of stove pipe. This completes the fire box of our canner.

The next part is the water container. The good tub serves for this purpose. This tub should be just a little larger than the one used for the fire box. Place tub No. 2 on top of the fire box.

Make the basket for holding cans out of the other old tub, which should be some smaller than tub No. 2. Remove handles from outside and place on inside of tub. Make several holes about one inch in diameter in the bottom of the tub. Place this inside tub No. 2. Some kind of a tight lid should be provided in order to save time and fuel. A piece of zinc answers the purpose very well.

If fruit or vegetables are canned in tin cans it is necessary to have a capping steel. This may be obtained from any manufacturer of canners. It may be heated in the fire box of the canner. There is a gasolene heater for capping steels on the market which does the work successfully.

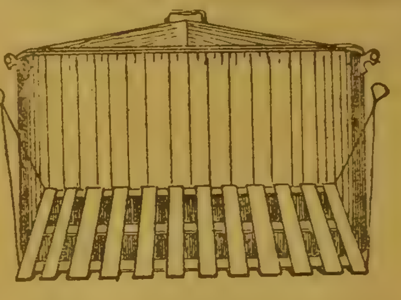
TESTING AND SEALING JELLY

Jelly that is overcooked becomes stringy. Watch it carefully, for when once it is cooked past the jellying point it is ruined. Immediately after the sugar is put in begin testing it by putting a spoonful in a saucer in a cool place; in a few seconds draw the tip of a spoon across the top of the jelly; if a thin film has formed it is done. Turn at once into glasses.

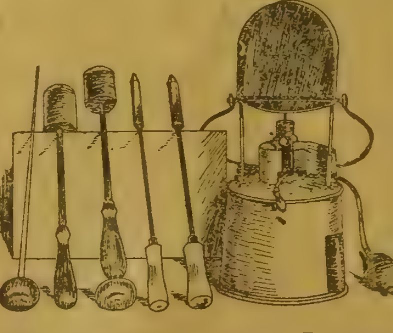
To prepare the glasses: Arrange the glasses on a rack or with a clean cloth under them in a kettle, fill the kettle with cold water, bring to the boiling point. When ready to fill the glasses lift with a large fork or spoon and turn out the water, but do not dry them with a cloth; fill at once with the boiling jelly. Do not fill the glasses quite full; then pour a tablespoon of melted paraffine over each.

CAN EVERYTHING YOU CAN

"There are several ways of canning both vegetables and fruit without a canner. The first thing we will need for a home-made canner is a boiler large enough to hold several cans at once. A tin washboiler is the best, as it is very cheap and can be set on the cook stove. A tray must be made to hold the jars and keep them off the bottom of the boiler. This tray can be made of wooden slats one-fourth of an inch thick. There should be two slats as long as the boiler, and short slats nailed on these the width of the boiler. It will be handier to lift the jars out if a handle is put on each end of the tray. The handle can be made of a piece of telephone wire or clothesline wire. It is nailed on by means of carpet staples, and a handle of wood can be made on top like a water bucket handle to keep the wire from burning the hands."



Washboiler With Home-Made Rack for Cans



Soldering Tools for Steam Pressure Outfit

The above is from the Oklahoma Stockman Farmer prize article on home canning methods. The writer goes on to say that her old time glass fruit jars are used, screwing down or clamping the tops as the boiling is finished. Vegetables she boils in this "canner" one hour a day for three days as it is necessary when steam pressure cannot be had. In that case she boils and seals, then removes the top prior to the next day's canning and seals immediately after boiling, and this is repeated the third day.

The boiler must be kept covered as tightly as possible to secure the highest degree of heat.

"This method of canning is a great advantage in canning fruits, as they are not mashed in the cans. It is also much pleasanter to put fruit in jars while cold."

Careful Tire Buyers
—seek the extra weight and strength; the known great service capacity, and the positive safety—found only in
PENNSYLVANIA Oilproof VACUUM CUP TIRES
The stout, massive knobs of the suction cup tread grip deeper and hold better on soft roads. They wear longest over the rough going of country service. And in town they mean perfect safety from skidding on slippery pavements.
Guaranteed 4,500 miles — with records showing that their average life is far greater.
Absolutely oilproof through and through adding greatly to life of tires where there are oiled roads.

General Agriculture

WHAT THE SMALL FARMER MAY DO IN THE SACRAMENTO VALLEY

By Sacramento Valley Contributor.

The grain farmer in the Sacramento valley—who handles from 1000 to 10,000 acres — frequently expresses extreme sorrow for the newcomer who is beginning to farm 10 to 40 acres under irrigation. The grain grower is often honest in his belief that the irrigator is doomed to failure and starvation—or if not that—to a very meager living. There was one successful old grain raiser in the upper Sacramento valley who sold the bulk of his acreage to a subdivision company, retaining about 2000 acres. As new settlers came in around him and he became acquainted with them, he used to say, "Well, I don't know what you are going to be able to do on 40 acres, because it looks as though I won't be able to make a living from this little bit of land I have left."

But this is probably only a manifestation of the workings of human nature, and the old man did not mean to discourage his new neighbors. We suspect that if he would recall the time 40 or 50 years ago, when he "took up" his land and started to plow for grain, he would remember that the cattlemen who were ranging stock over several counties were just as sorry for him and quite as confident that he could not make a living on 8000 or 10,000 acres.

From the standpoint of the future welfare and wealth of the state and nation, there is opportunity for considerable serious thought in this problem of the big and the little farmer in our great interior valley. We hear a great deal about the "march of progress" in subdivision and "get more people into the state" and all that sort of thing, but it is not often that much reasoning is applied to the subject. Just how will the small farmer make out? Will he be a factor of benefit in the permanent and successful future of the state? Is the big grain farmer doomed or will the country that is being subdivided all go back to extensive farming as some predict?

As we see it there is room in California for almost everybody. There are areas that may raise grain profitably for years—in other sections the production of high-class sheep and cattle will be a money-making business as long as people eat meat.

But we are especially and continually impressed with the possibilities for the right man and family on the good small irrigated farm.

Perhaps the first factor for the success of this small farmer is the human one. Every one must do his or her share. It is almost impossible for the enterprise to succeed if "nobody works but father." It is just the reverse of the comic song of a few years ago that described a family where "everybody worked but father." We know of many "back to the landers" — city folks impressed with the simple life as they read of it and have pictured it to be—who have gone to farming with the idea that the principal part of the work consisted of consuming cream from their own cows, fresh eggs and vegetables and sitting on the front porch. The whole family rebel at rising before 7 o'clock in the morning. Consequently in the summer the best part of the day for chores and work is gone before they have their breakfast. There is often not money nor revenue enough to hire all the work done, and poor father simply cannot do enough work on the ranch to make it look as though it was being farmed at all.

Now the other kind of a family is one where the main issue is the care of the crops and stock, keeping ahead of the work instead of always being behind with it, and where all are striving to make the greatest possible revenue from everything.

A well-planned diversified small irrigated farm will furnish profitable and pleasant occupation for a family during the entire year and every month there will be a nice revenue.

There will be alfalfa, of course, and every pound of it will be fed on the farm to some kind of stock. From a half-dozen to 15 or even 20 cows should bring in a gross return of upwards of $100 each per year. Skim milk and alfalfa and the corn and other grain grown on land not yet in alfalfa or orchard, or between the rows in the young orchard, will make lots of pork. Several well-bred sows should be kept busy raising pigs for this division of the ranch. A few sheep can always be kept to advantage, utilizing rough feed and weeds that will otherwise be waste, and the local butcher should be glad to pay top prices for the fat lambs and mutton that could be produced where they will be easily available for him whenever he wants them. There will some time be a silo on every one of these small farms for corn grown between the rows in the orchards or in rotation with other crops. Fruit trees and berries will be grown, and as they increase in age, the revenue will increase rapidly. Poultry and bees will always be a steady source of revenue, and in time the magnitude of the business and the revenue will be as big as the man, for nothing is more true than that an acre of land is just as big as the man who is farming it.

Comparisons are not always fair, but the differences in fundamental principles between this self-contained small irrigated farm and the large grain farm it is in many places superseding, leave much of the argument in favor of the small place.

On the one hand the owner and his family furnish all of the labor and the activities are well spread over the entire year; on the big farm the operator is more or less at the mercy of high-priced, inefficient, short-term labor. The small farmer has income from many sources coming in every month; the big grain grower gets his in a lump in the fall or winter. Things can be said for and against each way of receiving income, but the experience of most families is that the steady one is the most satisfactory. At any rate a crop failure or disaster of any kind cannot "break" the small farmer in one season as it can the big grower. Then prices of dairy products, poultry, meat and other somewhat concentrated products is generally more satisfactory than that of raw materials such as grain. This year is not exactly a fair criterion, but the prospects of grain selling at 75 to 80 cents per hundred leave a small margin to the grower when it costs 65 cents a hundred to produce it, as many claim. A 10-cent margin per sack, with a 15-sack crop, is only $1.50 per acre.

Let the good small farmer come to the Sacramento valley confident that if he selects a good location and is the right kind of a man with the right kind of a family, success is sure.

DAIRY COWS SELL WELL

Messrs. Rhoades and Rhoades, auctioneers for a recent sale held by W. H. Ginn of Corcoran, report the sale of 125 cows and 25 calves, most of them pure-bred Holsteins. The average for the entire sale was $100. The top-notcher was $250 for a pure-bred cow. Amongst the purchasers were Messrs. R. E. Lemoin, George Knudsen, E. R. Putz and McAllister & Son.

Dr. F. Franceschi, formerly of Santa Barbara, writes us from Tripoli: "Horticultural possibilities are simply immense here, but one must begin at the very beginning. Plenty of splendid soil, plenty of water, plenty of sun and the vicinity to all European markets are sure to bring very satisfactory results."

PRETTY BAD

"Helen is some talker, isn't she?"

"Rather. When she wants to express her sentiments she has to use the parcel post."

A Rare Opportunity

The Famous Brown and Brandon herd of dairy cattle is for sale. It consists of 330 cows, 48 heifers, 100 calves and 14 bulls.

Also 32 horses and a complete dairy and farm equipment, including wagons, harness, plows, harrows, etc.

Four Ranches for Rent

There are over 3,300 acres in the ranch, divided into four parcels. The land is leased and the leases run for four years more.

Death of one of the partners makes it advisable to close the partnership. The herd is the development of 18 years' painstaking effort to produce a superior dairy cow. The land has been well cared for and the business has been a money maker from the start.

If interested in the cattle, the implements or the land, don't fail to write for information and prices. This opportunity will not last long. Address,

Anybody can cut prices

—but it takes years of concentration and close study to produce a superior citrus tree.

When we tell you, therefore, that we are now selling the well known superior quality Teague Trees at prices as low or lower than anyone else — quality and responsibility considered — you can make up your mind that the present offers an exceptional opportunity for you to get your citrus grove started at a reasonable figure. Get in touch with us now. If you can't call—write for our quotations and suggestions.

CITRUS TREES EXCLUSIVELY

All Standard Sorts

We are the largest citrus nurseries in the world and can supply you promptly with almost any quantity of oranges, lemons and pomelos in all the standard sorts, as well as many specialties.

Call and See Us or Write Today

We will gladly give you full information and quotations: For 25 years we have been growing citrus trees exclusively and are the largest citrus nurseries in the world. You can gain some of the benefits of our years of experience by sending for our book, "CITRUS FRUITS" — handsome and unique in illustrations and get-up. It covers the industry from seed to market.

Price 25c postpaid. Get it.

Teague trees are started right, grown right, and shipped right.

Injurious to Laborer and Employer

Time for Serious Consideration of the Real Viciousness of the Proposed Eight-Hour Law. Even One Farmers Union of the State Has Endorsed It. Communications from Others Favoring It, also from Others Opposed to It.

The farmer may well regard some of the proposed initiative legislation as intended to put him out of business. The man whose family is large enough to enable him to carry on his general ranch operations, or who, in time of stress, can employ a small number of additional workers will perhaps not be so seriously handicapped as the single-handed employer who has occasion to harvest perishable products. The employer of a large force of workers may be able to so shape his affairs that he will not suffer seriously. The manufacturer we believe can also command help, but the middle class farmer, that is, neither the smaller nor the larger one, must practically go out of business. Mr. H. E. Collins, owner of large citrus orchards in Los Angeles County, writes:

'It strikes me the condition of affairs that will exist in California regarding the fruit industry, in event of the passage of this eight-hour law will result in owners of fruit ranches and vineyards renting to companies of Orientals, Japanese, Chinese or Hindus, who, all being partners or stockholders, can work for themselves unlimited hours. The owner will merely supervise the property in a certain sense, draw his dividends and throw out of employment hundreds of deserving white people. A large grower of Thompson seedless grapes from the north has already laid plans toward this end."

Now then the California Cultivator is in favor of an eight-hour day. The writer of these words has been with this paper for 12 years, and during that time the eight-hour day has obtained with the office force. At times overtime has been necessary, but this has been freely given and no charge has been made for it. During the last few years, in addition to the eight-hour day a half-holiday at the week-end has been granted, therefore the Cultivator has no objection from its own standpoint to the eight-hour law, but as it is worded, the disaster resulting from its passage will be so great in some lines that every one who has a vote, and every one who has influence for other votes, will be urged to get busy from this date until November 3rd and use every possible influence to defeat the measure. A great many have remarked to us that it is impossible for such a measure to pass, and to give an idea to such people of the real danger we quote in full resolutions passed by a Farmers' Union located in the Santa Clara Valley:

Farmers' Union's Resolutions

"The Rucker Farmers' Union held a special meeting last Saturday at the Rucker school house to hear Dr. H. R. Chesbro speak on the proposed universal eight-hour law. The doctor declared himself in sympathy with an eight-hour law for the trades, because there the worker is doing a specific, definite thing, but in his opinion it could not be applied to farm labor, such labor being too indefinite. After a number of questions had been asked by the audience and answered by the speaker, Mr. J. Holler offered a set of resolutions for discussion. On motion of Mr. G. A. McJunkin it was unanimously resolved to ask the California Cultivator to publish the resolutions for the consideration of the fruit growers of California.

"Considering the fact that farm laborers work longer hours for less pay than workers in any other industry, the economic oppression and financial dependence of the farmers cannot justly be blamed on the farm laborers, but their causes must be looked for in the increasing monopolization by a comparatively few individuals of all large industries, as well as the monopolization of the markets for farm products, the warehouses for the storage of crops, the cold storage plants, the packing houses and other means of control between the farmer and the consumer, and especially the legalized gambling in farm products by so-called boards of trade, produce exchanges and other speculators. For these reasons, if farmers want to better their condition, they must organize among themselves and by combined political and cooperative action make such private monopolies and gambling in farm products impossible, but not oppose reasonable demands of farm laborers whose unenviable conditions most certainly need improving.

"And considering the fact that the constantly increasing introduction of labor-saving machinery and the application of new inventions will necessarily result in constantly increasing the army of unemployed, and that the best immediate remedy for this terrible condition lies in a general reduction of the hours of labor.

"And considering the fact that a reduction of the hours of labor is a necessary step to the further progress of civilization, as otherwise the increasing misery of the unemployed and the physical overstrain of the employed, resulting from highly intensive labor for long hours, will inevitably lead to intolerable conditions for the masses, with riots, insurrection, bloodshed and all the horrors of labor wars and the dangers to civilization in their following.

"And considering the further fact that the true interests of the working farmer are in harmony with the interests of all other workers, and that we find the most permanent general prosperity and the highest standard of living among the masses—which include the farmers—in those countries where wages are highest and working hours shortest.

"We therefore declare ourselves in favor of the proposed universal eight-hour law, with the understanding that this law will not apply in cases where sudden dangerous changes of weather or unusual dangerous climatic conditions make extra or continuous labor in farming operations necessary to protect the property of the farmer—the crops—from danger or total destruction.

"We believe that the provision of the proposed law, by which extraordinary emergencies of danger to property are excepted from the eight-hour law, very properly applies to such dangerous, uncontrolable, incalculable farming conditions and perishable farm products.

"We have no doubt that this interpretation of the law, which fully protects the interest of the farmer, is acceptable to all fair-minded persons, and that the law will be interpreted in this sense by any judge or jury."

* * *

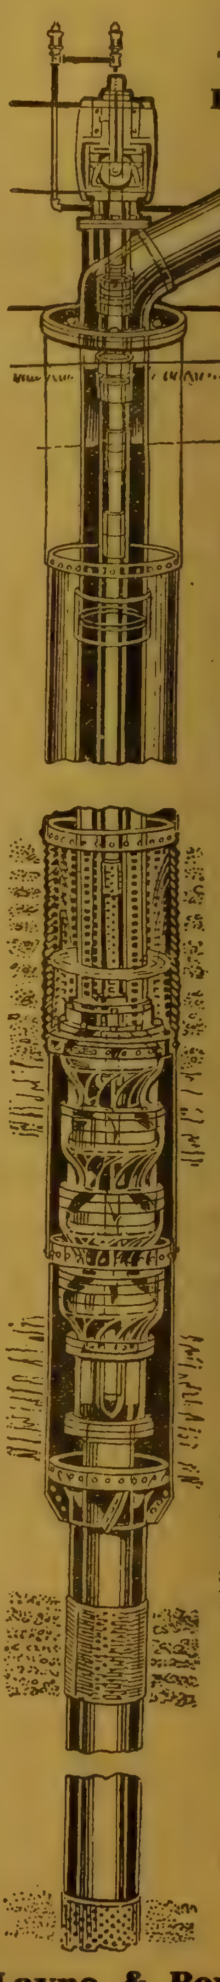
We call attention to the last three paragraphs in these resolutions. There is nothing whatever in the bill which justifies any such construction. A man may vote with all the mental reservations he sees fit. The law will stand as it is worded and courts can only construe the law without reference to the mental attitude of voters. In this particular the bill reads: "Except in case of extreme emergency caused by fire, flood or danger to life or property." We call attention to the construction which courts have placed upon the 16-hour law, which applies to trainmen and some others working for railway companies. In cases where accidents like washouts, etc., have prevented train crews from getting back within the required 16 hours the courts have construed that the employer has been liable, and a higher court has sustained it and only the decision of the supreme court remains to confirm such decisions. Now if in case of such accidents a railway company must hold up its train and lay off men in the middle of a run, or until fresh crews can be sent to them, how about the farmer's wagon on its way home from town

THE Successful Pump

For Western Irrigators

The Choice of the World's Leading Water Engineers

Tried
Tested
Proven



LAYNE & BOWLER PUMP

No matter what your pumping problems, this pump will overcome them. Your water supply will be increased, you will be assured of continual and efficient service the entire year, and the cost of producing water will be greatly lowered.

The Layne & Bowler Pump is of simple construction — no rods, valves, plungers, etc. Needs no priming. All adjusting done on top of ground. Has thorough system of lubrication. No pit. Unaffected by sand. Absolutely guaranteed.

Every irrigator should have our free Catalog No. 30, which gives valuable information about irrigation. Also tells about the Layne steel pit and well screen, which are in great demand.

Layne & Bowler Corp.

900-910 SANTA FE AVE.
LOS ANGELES, CAL.

with a load which a broken trace may have prevented arriving within the required eight hours? The members of Rucker Farmers' Union should do some serious thinking between now and election day.

Another, a subscriber of the Cultivator in San Diego County, writes:

Wm. Bloch

"This is the age of labor-saving machinery and appliances and of methods to make labor more effective. The columns of the California Cultivator are full of advertisements and descriptions of such machinery, appliances and methods. There is nothing in it to make labor easier, only to make it more effective. The men who work the tractor plows have to work as hard as they who still operate the two-horse plow. They work different muscles and different parts of the brain, but they get just as tired in as many hours. This is for illustration of the principle that works all through the various parts of farm work or other work.

"Now if the working people want to get the benefit of the inheritance to all that comes from the accomplishments of inventive genius through the past ages, if they want that in the shape of shorter hours, why should that be denied them? Should the employer be the sole beneficiary? It is true there will be some disadvantage, sometimes even to disastrous extent, to some employers, mainly to small ones. But there never is any law passed that at the start does not work hardship to some one. The larger employers won't feel it. Speeding up under closer supervision, and still more effective methods, appliances and machinery will give them equal results.

"To the working people themselves the law will probably not be an unmixed blessing. There will be indirect disadvantages that, to my mind, will offset the gains.

"As to the employers, those who read the California Cultivator and aim to be up-to-date in their work, those of them who would fight this law, they remind me of the man who got on his knees and prayed:

"'Oh, God, bless me and my wife,
My son John and his wife,
Us four and no more!'"

Mr. Bloch's statement, "There will be indirect disadvantages that to my mind will offset the gains," is entirely true, especially for the laborer. On this point, if we may be pardoned, we will call attention to the condition in this office where, as we have stated, the eight-hour day already prevails. If the law prevents one or all of the force from working more than eight hours in one day it will probably result in the loss to the entire force of the half holiday. We have not canvassed the entire force, but we think the vote of employees in this office will be unanimous against the proposed law. This for the encouragement of the farmer who may have felt that practically all working people will vote for the eight-hour law. Laboring people are not all short-sighted. Further, many are conscientious and have fullest interest in the success of the employer.

A subscriber to the Rural Californian, who now comes into the Cultivator family, writes regarding an editorial in the last Rural.

F. H. Clark, San Diego County.

"In looking over the Rural Californian my eye caught the title, 'Eight-Hour Law." As stated therein farmers are going wild about it. Now I do not believe in unions or the walking delegate, but I do believe in the eight-hour law and will work for it might and main. A man can do a day's work in eight hours, wether it be farming or other employment, and I'll take any man or men, no matter how many, and do more work in eight hours than these wild farmers can do in 12 hours with the same men. A man can do more work in 12 hours than in eight, but will he? If he does he is a fool. I believe in the old saying, 'Work while you work and play while you play.' Give the hired man a chance to play and he will be willing to work and the farmer won't have to sell his farm, for he won't have any trouble with his help and they will not want to see him lose anything. I wish to say you are publishing a fair paper. Keep it so, don't knock the eight-hour law, but push it along. If the farmer would only look into the future he would see it is for his good.

"Perhaps the most important statement in Mr. Clark's letter is 'A man can do more work in 12 hours than in eight, but will he? If he does he is a fool.'"

Permit us, Yankee-like, to ask: "If an employer agrees to pay his laborer $12 for services, but pays in depreciated money of a purchasing value of $8, is he honorable?"

There is and will continue to be a wide chasm between employer and employed so long as integrity is barred and trickery or delivery of less than is paid for is resorted to. No employee is ever paid more than he is getting until he earns more than he is paid.

Any spirit of holding back is dishonorable to the last degree and such employee will or should never get the second job in the same place.

GUIDE TO YOSEMITE NATIONAL PARK

The principal roads and trails in the Yosemite national park are described in detail in a circular just issued by direction of Secretary Lane. The most frequently visited places are the Yosemite valley, the Hetch Hetchy valley and the Mariposa grove of big trees. Yosemite valley, in the southern part of the park, is a great gorge about seven miles long and three-fourths of a mile wide, with a level park-like meadow in its center. The great cliffs which form the wall of the valley rise almost vertically to a height of about 3000 feet, and in many places are beautiful waterfalls which have a vertical drop of from 600 to 900 feet. There are three groves of big trees in the Yosemite park, the Merced the Tuolumne groves, northwest of Yosemite valley, and the Mariposa grove on the southern edge of the park. These trees (Sequoia gigantea), which are the oldest living things in the world, grow to a height of 300 feet, with a circumference of nearly 100 feet at the base, the bark sometimes exceeding 40 inches in thickness. Many of the trees are over 2000 years old. There are several transportation lines operated under concessions from the department of the interior, but every person is at liberty to provide his own means of transportation, subject to the rules and regulations. The circular just issued contains the rates authorized at the hotels and camps, a sketch map of the park, the rules and regulations and a list of books and magazine articles.

DON'T SIGN EVERYTHING

One danger of our institutions is the ever-ready petition signer. It is always easier to sign every paper that is presented than to turn it down or take time to understand what it means. The professional petition circulator is insistent in manner, and if not persuasive, often abusive if his request for signature is not promptly granted. But every voter owes a duty to himself and to his state not to put his name to every paper which may be presented to him. We doubt not half the names signed to a petition are signed without any conception of its true meaning. There are many petitions of real worth and the petitioners have true convictions as to their worth. Unless you have a conviction, pass them up.

Consolidation

California Cultivator Absorbs the Rural Californian and Now Leads All Weekly Coast Farm Papers in Circulation

In 1877 the old-time Southern California Horticultural Society, realizing the need of an organ, fathered and mothered for nearly three years the Southern California Horticulturist. On January 1, 1880, it passed into private ownership, and Messrs. Carter and Rice began the publication of Semi-Tropic California and Southern California Horticulturist. In November of 1882 Mr. Rice, with Mr. Martin as business manager, launched the Rural Californian, and the next issue announced the purchase of the Semi-Tropic California.

From that time until the present the Rural Californian has been published as a monthly, and it is one of the oldest magazines dealing with rural life on the Pacific Coast. A few years ago it was purchased by the Cultivator Publishing Co., and has since been issued by practically the same force as engage in the production of the California Cultivator. The business manager has decided that greater usefulness may be secured by merging these two papers and giving to advertisers the benefit of the greater combined circulation, which now aggregates nearly 25,000 papers every week, and to subscribers the benefit of the centering of our energies in the one paper.

The June issue of the Rural Californian is the last one of that magazine to appear. Beginning with this number, the first in July of the combined papers, Rural Californian subscribers will have their subscriptions continued for the unexpired term. Those who were subscribers to both papers will have their time extended.

All the features which have been helpful in the California Cultivator will, of course, be continued. In addition, some which have proven so popular with subscribers of the Rural Californian will be taken up, and, as soon as arrangements can be completed, the household and other departments will carry on some of these favorite features; for instance, in the household department, announcement will later be made of contests for recipes, menus, etc., and we hope to give in one issue of each month a page to prize photographs of home life on the Pacific Coast. More definite announcement will be made in later issues.

In addition we ask our subscribers to send in suggestions or requests for any line of cultural information desired. This office does not possess all information, but it is in touch with specialists in practically all lines, and it will act as a clearing house through which the experience of others will be gathered in and passed on.

Only during the past week have we been called upon by a subscriber in far away Syria sending flowers of Citrus Medica infested with some insect. How shall he treat it? The problem has been passed on to entomologists and as yet we have no definite treatment suggested, but it will be secured. Another, near Bombay, recently asked as to fertilizing citrus trees. Another, in New Zealand, is using the Cultivator forces in securing for him a complete agricultural library. A letter is just opened from a Greek farmer on the island of Cyprus. He wishes to know all about maize, and as to whether it is harvested the same as wheat and beans are. South Africa and Australia often come for information and with information. And so on around the world the Cultivator goes, always serving. We wish to make its service greater, especially up and down the Pacific Coast, where the problems are many and apparently increasing day by day.

One of these problems, hardly months old yet, is the matter of home canning. It is of vital interest to many, especially many members of the Rural Californian family. This number gives material help along this line and from those who know.

INITIATIVE MEASURES

There have been many who were skeptical as to the real value of the initiative and referendum. They have said that it is contrary to the republican form of government and will not result in securing the best for all the people, and especially has it been charged that the rabble, influenced by prejudice, would act unwisely. The number of initiative measures which will be brought before the people at the next general election is giving these people opportunity to say, "I told you so." Sure it is, the testing time is here. Will the people have wisdom to meet the test or will they lose these features which we believe mean much to the future welfare of this state? Especially may we refer to the eight hour initiative measure which has startled the producers of the state until they are discussing possibilities of their remaining in business should that or any similar measure ever pass. Strangest of all, one farmers' organization of the state has committed itself to this measure and excuses its action because of the mental reservation which the members say they have made as to how the law shall be enforced. This eight hour bill was presented by the only socialist member in our state legislature; it was overwhelmingly defeated, then it invoked the initiative. As only "eight per cent of all the votes cast for all candidates for governor at the next preceding general election at which a governor was elected, proposing a law set forth in full in said petition," is sufficient to force this matter to a vote of all the people, it may be seen how easy it is to start something under our constitution as it stands today. Whether this per cent should be made greater or not is a long question, but surely those who would see the best institutions of our state preserved must work from this day until election day that this measure, which is so dangerous to the best interests of the producers of the state, may be defeated.

As no law which is initiated by the people is subject to the veto power of the governor, action of the electors is final and immediate, for within five days after the final declaration of the vote by the secretary of state the law becomes operative.

A most able presentation of the effect of this eight hour law—if it becomes one—has been given to our readers by Mr. Hecke and others, and we do not stop to discuss it here, but call attention to other points regarding it on page 10 of this issue. In addition we will say that an article as to what the initiative is, written by Attorney E. L. Payne for Cultivator readers, will appear in our next issue.

Agricultural News Notes

"Fully 50 per cent short" is the report as to Florida's spring and summer pineapple crop. Shortage was caused by heavy spring frosts.

A country life conference is announced for the last week in July by the college of agriculture of the University of Minnesota. The conference is to be held at the university farm.

According to the census of 1911, there were 2,594,179 cows in Canada last year. This was an increase of 185,502 as compared with the census of 1901. The increase was all in the western provinces.

Farmers in the country about St. Louis have perfected a cooperative business exchange which does business for producers of both Missouri and Illinois, both in marketing and purchasing supplies.

Recently a movement has been started in Paris to bring about regulation of letter postage among the American, French and British governments to two cents in the interests of commerce and general intercourse.

A London engineer claims to have discovered a method by which light may be transmitted by wire. At the receiver the object before the transmitter is reproduced as a flickering image. The invention is called the "televista."

Nine hundred million bushels of wheat, almost half of the average world's wheat production, and a new record for the United States, is the prospective total yield of the farms of the country this year, the department of agriculture has announced in its June crop report.

Wool producers and manufacturers met in conference in Washington June 4, at the call of Secretary Houston of the department of agriculture. The object of the conference was to discuss methods of raising the grade of American wools. It is hoped that a system of standardization will later be reached.

On the Pennsylvania railroad, by a recent order, whenever passenger coaches are crowded, a train man must announce the number of seats available in other coaches, and must tell the number of seats available in each coach. Special care must be exercised at the larger terminals where passengers are liable to be inconvenienced by the congestion of travel.

Under the old method of ventilating the tunnels of the underground railways in London, the air was withdrawn by means of an exhaust fan. By the device now being installed at the new embankment station, constant supplies of air will be pumped into the tunnels throughout the day and night. Ordinary air is passed through a washing screen which extracts the impurities, the requisite humidity is next imparted, a proportion of ozone added, and it is then sent into the stations at the rate of 25,000 cubic feet per minute.

There are said to be nearly or quite 1000 varieties of rice in the Philippine Islands. It is probable that some of these will prove nearly duplicates, but the actual number of varieties is very great. The bureau of agriculture has been carrying on work looking toward finding out the best dozen or so varieties from this great number and progress enough has been made to make it certain that if the work is continued it will be possible within one or two years more to send out these chosen varieties and thus make possible an increase of from 10 to 20 per cent in the rice crop of the islands.

Agricultural News Notes of the Pacific Coast

Northern California

Dairyville, Tehama County, is to install an alfalfa meal mill.

Some almond growers have already contracted Nonpareils at 17 cents.

The creamery at Woodbridge, San Joaquin County, is being remodeled.

The hop crop, it is estimated, will be from one-half to three-fourths of a normal yield this year.

Hop vines at Chico, Butte County, have been seriously damaged by an attack of army worms.

The new cheese factory at Dairyville in Tehama County will start operations the first of this month.

The South San Joaquin Irrigation District has voted an assessment of $140,000 to complete its irrigation system.

It is stated that at least 45,000 olive trees have been planted this season in the district about Oroville, Butte County.

Cloverdale's semi-annual wool sale the middle of June brought good prices, the average for short wool was 31 cents a pound.

The Holstein Friesian Association of America has appropriated $5000 to maintain a show herd at the Panama Pacific Exposition.

Yolo County farmers are finding dynamite an effective remedy against ground squirrels, a fourth of a stick being fired in each hole.

Alameda has organized a farm bureau and is taking every step for the employment of a farm adviser as soon as one may be secured.

Long Valley in Mendocino County reports hops giving exceptional promise for a big crop; much new acreage has been planted this year.

The poultry club of the high school at Ferndale, Humboldt County, has entered into a contest which will last until the time of the Ferndale fair.

Newcastle, Placer County, has shipped up to June 10, 45 cars of fresh fruit, which is largely in excess of last year's shipments at same date.

Farmers in the lower end of the Sacramento Valley are beginning to realize the extent to which the walnut industry may develop for that section.

Sacramento reports the largest shipment of ripe apricots ever passing through that market. More than 800 cars have been shipped to date and less than 400 were shipped the same date last year.

Experimental planting of rice has been made on red soil of the Honcut region of Butte County. It is thought that the rice on this soil will be ready for harvest earlier than rice grown on adobe soil.

Mt. Lassen, one of the higher peaks in California, located in Shasta County, has been causing consternation to many living near it because of eruptions from an ancient crater, which has been inactive for 200 years.

A cow-testing association has been formed at Woodland, Yolo County. Twenty dairymen are members and something over 600 cows will be tested regularly. Officers are: C. R. Hoppin, president; A. B. Welch, vice-president, and H. K. Brown, secretary-treasurer. H. D. Cameron was employed as official tester.

Central California

Tulare County is now making heavy shipments of apricots.

The warm weather is speeding up work on the apricot orchards.

Kings County estimates its wheat and barley crop at 1,680,000 sacks.

Another grafting of walnuts on oak experiment is being tried in Tuolumne County.

Automobile owners are improving the opportunity of using the Wawona road into Yosemite Valley.

The annual gathering and election of the Strathmore Citrus Association has been deferred until September.

Directors of the Fresno district fair are making special offers to secure exhibits of cattle at the coming fair.

Many growers are reported holding their peaches to make into dried fruit, as green fruit prices have not been satisfactory.

The horticultural commission of Fresno County will make an exhibit of insect pests at this fall's Fresno County fair.

The Commercial Club of Fresno is starting a campaign to have an experiment station and farm established at Kearney Park.

The sugar beet factory at Visalia began slicing the first of July. Many growers are considering signing up long-term contracts.

Melon growers of Exeter, Tulare County, are talking up a plan for cooperating with the Dinuba Melon Growers' Association.

Fresh grape shippers of Central California recently met at Fresno and discussed methods of securing a standardized raisin pack.

Some boosters have estimated that the total output of the farms of California this year will aggregate not far from half a billion dollars.

The state hospital at Stockton is to have a new dairy. Twelve thousand dollars has been appropriated for the purchase of a herd of Holsteins.

Some dairymen near San Jose have found serious results from feeding cattle baled alfalfa in which small pieces of baling wire were found.

Grain sections of Tulare County are pleased "because the good old days are here again" and immense quantities of grain are being delivered at the packing houses.

Fumigation has been given some severe tests with a new citrus pest, Coccus citricola, in Tulare County. It is now thought successful work will be done against this scale.

Tulare County fruit growing sections report Bartlett pears at $50 a ton, canning apricots at $40 a ton and canning peaches anywhere from $17.50 to $32.50 per ton.

Fruit growers of Watsonville, Santa Cruz County recently met and conferred with the agent of the Northwestern Fruit Exchange regarding disposal of the coming season's apples.

The Dinuba Melon Growers' Association has elected officers for the coming year as follows: President, Charles Dewhirst; secretary, R. C. Dudney; directors, C. B. Driver, Abner Fraser, W. Winrod, Charles Dewhirst and R. C. Dudney.

Southern California

The cannery at Hemet, Riverside County, started on June 15.

Hemet reports its apricot crop as practically the same as one year ago.

Rialto — Bloomington sections are planning a persistent fight on scale pests.

Neighbours, Riverside County, is concerned as to cotton gin capacity to handle its immense crop.

Ventura County is busily organizing a county farm bureau in preparation for farm adviser work.

The Covina Valley Farmers' Club recently met and discussed matters of interest regarding the coming elections.

Lima bean growers of Ventura County will meet at Oxnard on Tuesday afternoon, July 14th, in annual session.

An agent of the trust-busters of the government is investigating marketing conditions in the melon section of the Imperial Valley.

The Colorado river has been on its usual June rampage, but is now lowering slowly. Serious damage resulted in some sections.

The Imperial Valley hog producers have organized the Hog Raisers' Association. An effort will be made to improve conditions in the valley.

The Cucamonga Foothill Orange Growers' Association is discussing the erection of a new packing house on the line of the Pacific Electric railway.

Some cantaloupes are reported as arriving in market in very poor condition, but as a rule we believe the Imperial Valley has been careful in its shipping.

Puente, in Los Angeles County, is shipping between 1200 and 1500 crates daily of strawberries, blackberries, gooseberries, loganberries and raspberries.

The sugar beet factories of Southern California will all start earlier this season than ever before. It is thought they will be in operation by July 10 or 15 at latest.

Various booster and beautifying committees of Los Angeles County are arranging to meet in Covina and give new impetus to the clean-up and planting campaign for 1915.

Imperial Valley irrigation people are making an effort to have congress aid in securing permanent control of the Colorado river. The river is falling and this year's crisis is passed.

The rights of the Chucawalla Irrigation Company to dam sites on the Colorado river have been forfeited. The company was unable to secure confirmation of its rights by the government.

The recent meeting of citrus growers of Rialto and Bloomington sections discussed fumigation, and a committee was appointed to look over various divisions and districts and investigate as to cost of fumigation supplies.

Ventura County now has a fully organized farm bureau. The newly elected officers are: President, Thomas A. Rice of Oxnard; vice-president, Wm. Arniel of Camarillo, with four directors-at-large, T. G. Gabbert of Ventura, A. C. Hardison of Santa Paula, Charles Donlon of Oxnard and E. S. Thatcher of Nordhoff.

The Coast

Apricot growers of western Washington are finding exceedingly light crop because of late frosts.

The college of agriculture of Washington held its second rural life conference at Pullman, June 30th to July 2nd.

The cattle shipments from Yavapai County, Arizona, will total 5000 head and will bring producers a million dollars.

Grain threshers will start on the harvest immediately after the fourth in the district about Connell, Washington.

The Fruit Protective League of Opportunity, Washington, recently called out all the members to fight fire blight in the orchards of two members.

The North Pacific Fruit Distributors claim they will control 65 per cent of the fruit crop of Oregon, Washington and Idaho during the fruit season of 1914.

Washington is now supplying sufficient local potatoes to its markets and orders for California "news" have been reduced almost to the vanishing point.

The agronomist of the Utah experiment station reports after a tour covering much of the state that this year's crops in Utah will be greater than ever, or at least above normal.

The agricultural experiment station at Pullman, Washington, is establishing an arboretum in which it is proposed to grow a group of each of the important timber trees of the temperate zone.

Arrests of grocers are being made at North Yakima, Washington, because of selling strawberries and small fruits in containers that do not follow specifications laid down in a recent enactment.

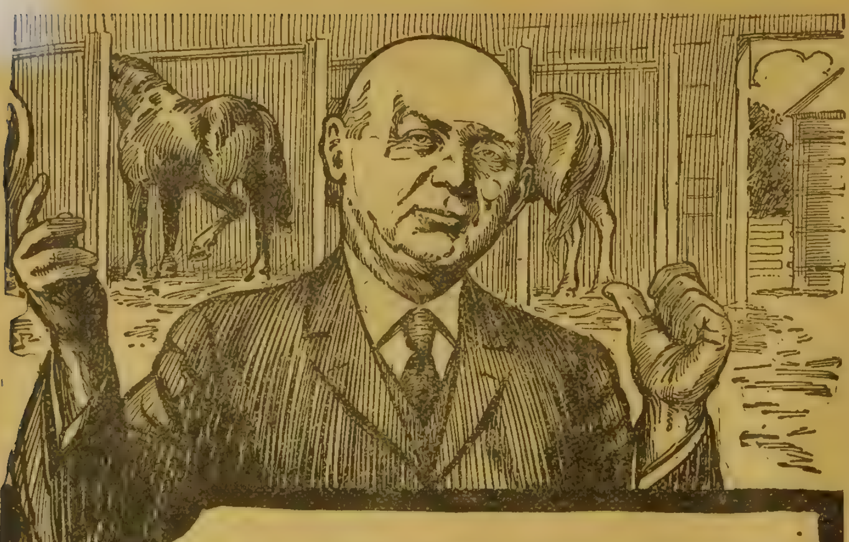
The cherry producing section of western Oregon and Washington reports active market, and with California cherries lessening in quantity, opportunity for the disposal of the northern grown fruit is improving.

Poultrymen of Washington, Oregon and Idaho are uniting in demand on the governors of those states for regulation of the Chinese egg trade, one feature of which will be the announcement that the eggs are produced in China.

Besides liberal cash premiums, the Northwest Live Stock Association, which will hold a live stock show at Rosalia, Washington, will conduct an auction at which it is expected long prices will be secured for all stock exhibited.

The city of Tacoma, Washington, has entered into a cooperative agreement with the forest service for the protection of the source of its water supply, the watershed of the Green river, which lies within the Rainier national forest.

A combination of fruit growers in the Willamette, Rogue River and Columbia River valleys has been effected to cooperate in cultivating, harvesting, packing, shipping and marketing. The organization will be incorporated as the Western Oregon Fruit Distributors and will market through the North Pacific Fruit Distributors.



Avoid the Dangers of Stall Feeding

DR. GILBERT HESS,
Doctor of Veterinary Science
Doctor of Medicine

I want to warn you in time that stock taken off pasture and put on dry feed are pretty apt to get out of fix, because corn, grain, hay and fodder do not contain the laxatives so abundantly supplied in grass.

Some of your animals are sure to become constipated, others off feed, rough in the hair, with paleness of the eyes, lips and nostrils, or the legs may stock or dropsical swellings of the abdomen appear, or the urine may become yellow and thick; but the common ailment of all, especially among hogs, is worms, worms.

Dr. Hess Stock Tonic

Makes Stock Healthy. Expels Worms.

Being both a doctor of medicine and a veterinary scientist, I formulated Dr. Hess Stock Tonic to correct these evils. It contains a laxative substitute for grass, diuretics to remove dropsical swellings, tonics to improve the appetite and increase digestion and vermifuges to expel worms.

So sure am I that Dr. Hess Stock Tonic will put your animals in a thriving condition, the ailing ones healthy and expel the worms, that I have authorized your nearest dealer to supply you with enough for your stock, and if it does not do what I claim, return the empty packages and get your money back.

Right now is the time to feed Dr. Hess Stock Tonic, because it's the cow in the pink of condition that fills the milk pail, the steer with an appetite that lays on fat, the horse that digests its dinner that pulls on the bit, the hog that is well and worm-free that gets to be a 200-pounder in six months.

Dr. Hess Stock Tonic is never sold by peddlers—only reliable dealers; I save you peddler's salary and expenses, as these prices prove: 25-lb. pail $2.25; 100-lb. sack $7.00. Smaller packages in proportion.

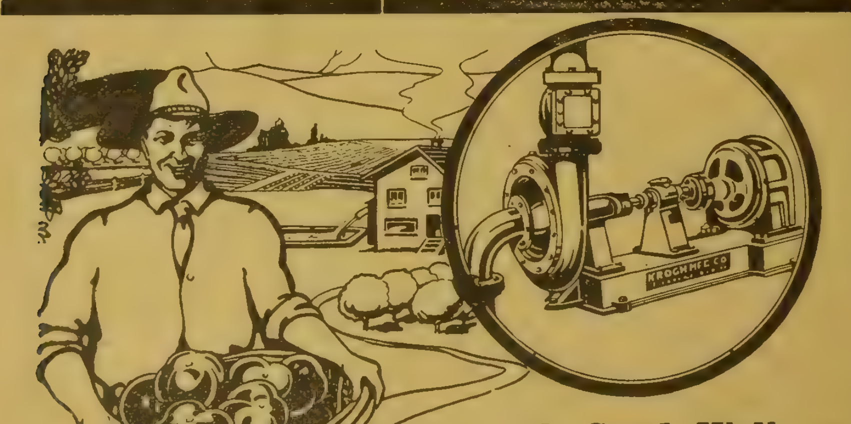
DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Poultry Pan-a-ce-a

A splendid poultry tonic that shortens the moulting period. It gives the moulting hen vitality to force out the old quills, grow new feathers and get back on the job laying eggs all winter. It tones up the dormant egg organs and makes hens lay. Also helps chicks grow. Economical to use—a penny's worth is enough for 30 fowl per day. 1½ lbs. 35c; 5 lbs. 85c; 25-lb. pail $3.50. Guaranteed.

Dr. Hess Instant Louse Killer

Kills Lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks or keep it in the dust baths, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 35c, 3 lbs. 85c. I guarantee it.



A Good Well - A Krogh Pump

This combination is the happy solution of all your irrigation problems. Water when you want it and as much as you want. No matter if your wells are shallow, medium or deep—there is a Krogh Pump that offers you the greatest efficiency and economy. We would like to tell you about these Pumps and will be glad to hear from you. Write us fully about your wells. Our engineering department will offer suggestions if you wish.

REAL COOPERATION IN DAIRYING

Written for the California Cultivator
By Leroy Anderson.

Three dairymen of Los Molinos, Tehama County, are to be credited with originating a novel and helpful scheme of cooperation. Each one has a 20-acre ranch a few miles north of Dairyville in the Los Molinos project. I am inclined to think that Chas. Pramme is the father of the idea. He was a marine engineer before he turned to ranching three years ago and now he is president of the Dairyville Producers Association. The three neighbors have owned a pure-bred Holstein bull in common for some time. Mr. Pramme keeps the bull and the others pay him for their share of the feed, while he has the manure to pay for the care. This may have given the cue to further cooperation, but there were other motives. Mr. Pramme built a barn large enough to hold 30 cows—he has less than 10. He began building a silo and purchased a gas engine and silage cutter at a cost of $600. He has a milking machine run by the same engine. This same equipment will do the work for three ranches, so why not come together? The result of thinking was cooperation on June 1st and it is "going splendidly," as Mr. Pramme writes.

The plan is simple—each one furnishes the same number of cows and the same acreage to produce feed and an equal amount of labor. The cows are kept on the place where the barn is and are fed either in stable or corral. They expect to do the milking in about one hour—one man attends the machine, one strips after the milker and the third separates the cream. Each one pays Mr. Pramme interest on his investment in machinery and equipment, and the profits are divided equally. The manure is shared equally. This looks like a mighty good scheme for the small ranchers and Cultivator readers will hear more about it later.

"THINKING HOG"

Written for the California Cultivator
By Sacramento Valley Contributor.

We wonder if ever anyone has made a big success of the hog business who does not enjoy watching his hogs eat and who does not "keep an eye" on them whenever opportunity offers. Personal attention and a liking for the business are prominent factors of success—and this certainly applies to the business of raising and marketing hogs.

There are many things that a good hog grower is interested in that he can find out only by being "on the job" and watching his animals.

Do the hogs eat up their feed clean and are they "keen" for their feed? Does the feed they are getting agree with them? Are they making all the gain they should? Is their hair and skin in good condition? Is the excrement of the proper consistency or is it to too hard, indicating feverish intestines or too little green feed in the ration, or the need of a laxative—or too loose, indicating a disordered condition of the alimentary canal and fermentation from some source? Would a little oil meal added to the ration help the other feed to do better work Would soaking the grain make it more palatable, a little more bulky and a little less liable to pass through the alimentary tract whole? Should the hogs have more green feed? Why are some of them scratching—will it pay to build a dipping tank, or shall they be run in a close pen and sprinkled with sheep dip and some oil to kill the lice that are getting a part of the profits? Are some of the pigs too "cat hammed" and just what kind of a boar should be mated with them to make the needed improvement?

All of these things and many more can be solved satisfactorily only by the man who thinks "hog" and who is where the hogs are while he observes the things that are "fundamental details."

SORGHUM GRAINS FOR PIGS

A very instructive experiment in pig feeding, under the supervision of Prof. F. W. Wilson, animal husbandman of the University of Arizona Agricultural Experiment Station, was recently completed, using feeds grown in Arizona. Four lots of four-months-old pigs, equal in weight and condition, were selected and fed as follows:

Lot 1—Chopped alfalfa straight.
Lot 2—Milo maize heads.
Lot 3—Chopped alfalfa and milo maize heads combined in a balanced ration.
Lot 4—Chopped alfalfa, milo maize heads and barley.

Somewhat to our surprise, not only the largest, but the cheapest gains per pound, were made by the lot fed on straight milo maize. This appears to be a substitute, under our conditions, for corn as used in Kansas for pork production. In as much as milo maize is much better suited to the climate of the region and is also more productive in grain than corn, it would seem to point the way to profitable hog feeding operations here. Kaffir corn or feterita have practically the same feeding value and may be used instead of milo.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Growth on Jaw

I have a cow that has a small bone-like growth on her right lower jaw. It seems like hard gristle and is a little tender. The growth is lengthwise of the jawbone, but sticks straight out an half inch and is an half inch in diameter. If you know what it is, please give remedy.—Subscriber, Lompoc.

The growth may have been caused by a slight injury. If so there probably is pus in it. The skin of a cow is very thick and pus will not rot its way through as in most animals. So you had better open it and if you find pus, clean out the cavity and inject a solution of permanganate of potash: half a dram to the pint of water. If you find no pus then it may be lump jaw. In that case the lump will continue to grow. If it does grow larger and you conclude that it is lump jaw then use the treatment recommended for that disease in the Cultivator of June 4th on page 690.

Itchy Skin

Will you please advise me respecting my colt 10 weeks old. He is rubbing himself against the fence and biting at places on his body. There are no places where the hair is off. I have put food tonic in his grain, but he eats very little of it. Would it be safe to clip him and rub something on him? His hair is rather long on his body.—Subscriber, Modesto.

Yes, it will be perfectly safe to clip the colt and will probably do him good. The irritation may be caused by lice and whether it is or not it will do him good to wash him all over with a solution of sheep dip. Use a teacup of the sheep dip in a bucket of warm water. Repeat the wash in a week and you will probably see good results.

Worms

Will you kindly advise me through the columns of the Cultivator what remedy to use for the cure of white worms in horses — Subscriber, Orangehurst.

The long round worms infest the

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's

A Forage Plant That Will Yield More Than Alfalfa

And unlike alfalfa, this new forage plant will thrive in arid and semi-arid regions without irrigation; yielding about four times the food value in forage per acre as alfalfa. We refer to the Luther Burbank pedigreed Spineless Cactus, which has rightly been termed the "miracle plant."

A farm has been established near Riverside, California, for growing Cactus Slabs of the Luther Burbank pedigreed varieties for planting. These slabs are sold in large or small quantities. A request to the El Campo Investment & Land Company, 211 Story Building, Los Angeles, will bring you free an instructive Folder on Cactus Culture.

BLACK LEG
LOSSES SURELY PREVENTED by Cutter's Blackleg Pills. Low-priced, fresh, reliable; preferred by Western stockmen, because they protect where other vaccines fail. Write for booklet and testimonials.
10-dose pkge. Blackleg Pills $1.00
50-dose pkge. Blackleg Pills 4.00
Cutter's Blackleg Pill Injector 1.50
Discounts: 250 doses, 10 p. ct.; 500 doses, 20 p. ct. Use any injector, but Cutter's simplest and strongest. Every package dated, unused pills exchangeable for fresh after date on package. Do not use old vaccine (ours or any other), as it affords less protection than fresh. Insist on Cutter's. If unobtainable, order direct. Send check or M. O., we pay charges and ship promptly.

stomach and bowels. Have the following prepared by a druggist and give as directed: Powdered gentian, three ounces; areca nut, one ounce; dry sulphate of iron, one ounce; nux vomica, one ounce, and fenugreec, three ounces. Mix and make 30 powders. Give one morning and evening. At the end of one week give one ounce of spirits of turpentine in half a pint of raw linseed oil and repeat the oil and turpentine again when the powders are all used. Another good old-fashioned remedy for stomach worms is salt and wood ashes. Mix one part of ashes with three parts of salt and give a small tablespoonful once a day.

Spavin

I have a four-year-old mare that was kicked on the hock joint about three months ago. There was considerable swelling at first and she was quite lame. In about a month the swelling was all gone and she was apparently entirely over her lameness. I put her at light work and she appeared all right for three or four days, but all at once she went very lame. I turned her out and in a few days she seemed all right again. After a few more days' work she became lame again. Thus it has gone on for two months. There is absolutely no swelling or soreness. What is it?—Subscriber, Forestville.

Probably there is some inflammation left in the bones of the hock caused by the injury and may finally develop into a spavin if nothing is done for it. A good blister on the inside of the hock may reduce the inflammation and prevent a spavin. Avoid giving her hard work or using her on hard roads until after you have applied two or three blisters.

Open Salivary Duct

About six weeks ago I had a valuable horse develop a swelling in his throat and left side of jaw. It grew gradually worse until I called a veterinarian and he pronounced it strangles. He blistered the throat and jaws twice about three days apart. He then poulticed it. Several pints of foul matter was removed, including barley beards, so he concluded it was barley beards that caused the trouble and not strangles. The wound, which was about as large as the crown of a hat, has about healed over, but the duct carrying the saliva to the mouth makes its discharge at the wound. When I feed the horse, especially grain, the saliva spurts out of his wound in a stream as large as a straw. When the horse is through eating the flow ceases.—Subscriber.

If the duct is only open on the side, your veterinarian may be able to close it by scraping the edges, putting a stitch in and covering the wound with collodion. But if the duct is completely severed then you will probably have to entirely destroy the gland. This can be done by injecting a strong solution of nitrate of silver or a strong tincture of iodine, but the surest way to make a complete job of it is to remove the gland. This operation would have to be done by a veterinarian who knows his business.

Sore Teats

We have a cow whose nipples crack all the time. She has a calf and we let it suck two of the nipples. I put salve on, but it does not seem to help. Every year she has this trouble. Please advise us what to do.—Subscriber, Fowler.

Sometimes it is a difficult matter to heal sore teats while the cow is milking, but it can be done. After milking wash the teats clean with warm water and dry them carefully. Then apply an antiseptic lotion. Use bichloride of mercury and water one to one thousand. You can get the tablets of your druggist and put one in a pint bottle and fill it with water. After the lotion has been applied a few minutes anoint the teats with oxide of zinc ointment, which your druggist can also supply. If the ointment is too hard, warm it a little before using and it will not hurt it if you add a little olive oil to it while it is warm to keep it soft. After a few treatments you will only have to wash the teats and apply the ointment after milking.

Alpha Gasoline Engines
Sizes from 2 to 100 H. P.
Portable or Stationary

The Peer of Them All
The ALPHA ENGINE represents the very highest and best of engine design.
The best material that money can buy.
The skill of expert workmen.
Economy of fuel and low cost of upkeep.
That ability to stay on the job 365 days in the year and 24 hours per day.
One hundred cents' worth of value for every dollar invested.
No Batteries No Coils No Troubles
Service is what every power buyer wants to buy. It is the only thing he should purchase. The name, "Alpha," on an engine means continuous service with a low cost of maintenance.

MORE MILK AT LESS COST

500 LBS. MORE MILK per day by feeding LARROWE'S DRIED BEET PULP

READ THIS LETTER from Hutton Bros., proprietors Dixon Certified Milk Farm, Dixon, California:

"It might be of interest to you to know the results of feeding Larrowe's Dried Beet Pulp at our dairy. We are milking 167 cows and are feeding 1200 pounds of pulp per day about 7 pounds to the animal. The pulp is fed in addition to a grain ration of 5 pounds per animal, together with all the alfalfa hay they will eat. As stated above, the grain and hay is our regular ration, and the beet pulp increased our milk yield almost 500 pounds per day. The increase was during the stormiest and most uncomfortable weather of last winter. When we were getting these results from this method of feeding, our supply of beet pulp was suddenly exhausted and for several days we were unable to get any more because of the washouts on the railroad. Our milk output almost immediately fell off the amount of increase mentioned, thus furnishing absolute proof that the pulp is to be given credit for our unusual milk yield, which has again attained the maximum since we obtained a fresh supply upon the arrival of the delayed carload. We unhesitatingly recommend beet pulp to any and all dairymen who feed for results."

Be sure you get LARROWE'S Dried Beet Pulp. It is uniform in color; never blackened or burned.

Larrowe's Dried Beet Pulp is clean, healthful, succulent, and will not only increase your milk yield, but also keep your stock in better health and condition.

It is simply the pure shredded root of the sugar beet with only the sugar and water extracted. Always uniform. Keeps indefinitely. 1 ton contains as much nutriment as 5 tons of silage. It is light, bulky; aids digestion and is a wonderful feed for dairy cows, hogs, horses and poultry.

Get 1 Sack From Your Dealer Today and prove its worth by feeding to one cow whose milk record you know. You'll get instant results.

"PROFITABLE FEEDING" —our illustrated booklet giving feeding instructions and other information—will be mailed free on request.

THE LARROWE MILLING CO.
607-608 Central Building
LOS ANGELES, CALIF.

Some feeders prefer Larrowe's MOLASSES-Dried Beet Pulp for its sweetness. Just the plain pulp with beet molasses dried. Fine for fattening, also for horses.

The Ornamental Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris.

The warm, dry season of midsummer is not generally conceded to be a favorable planting time, in fact, many consider it quite the contrary. Notwithstanding this, most of the annuals may be planted during this month for fall and early winter blooming, requiring only a little extra care in the preparation of the seedbed and protection of the young plants. Seedbeds should be shaded with lath or a brush covering or the more hardy plants may be covered with a good mulch. Among good fall bloomers are the annual chrysanthemums, gypsophila elegans, cosmos, candytuft, centaureas, clarkias, dianthus, godetias, larkspur, linum, marigold, mignonette, pansies, stocks, phlox, petunias, salpiglossis, schizanthus, zinnias, wallflowers, winter flowering sweet peas, cornflowers, etc. Most of the annuals bloom in about three months.

For spring blooming perennals and biennials this is the best season for seeding. The list of these includes campanulas, delphiniums, antirrhinums, snapdragons, calendulas, gaillardias, carnations, dahlias, gypsophila paniculata, hollyhocks, mimulus, nasturtiums, penstemons, petunias, verbenas, English daisies, coreopsis, digitalis, hunnemania, scabiosa, salvia, statice and many others.

For shady nooks there are cinerarias, cyclamen, begonias, heliotrope, primulas, torenia, vinca, gerbera, lobelia.

The list of the most popular winter flowering plants includes stocks, pansies and sweet peas. Of the stocks the early large flowering requires nearly four months to bloom, pansies will bloom in four to five months. The winter flowering sweet peas require three to four months, according to variety. For spring flowering pansies plant in August, but use care in shading the seedbed. For this purpose burlap is an excellent material.

PLANT FLOWERS EVERYWHERE.

Every farm home is so easily and inexpensively made a place of beauty by planting flowers all about it that it seems strange there should be a single country home tnat is not embowered in greenery and blossoms. They should be planted everywhere, and with little care and attention will yield such a wealth of growth and bloom as will transform the most unsightly places into objects of beauty. If you have little time to give to their care and cultivation, plant only the most common hardy sorts that bloom profusely, petunias, nasturtiums, portulaca, poppies, pansies and asters and morning glories, scarlet runners and the wild cucumber for screen and shade. A flower garden and set beds are not necessary. Indeed, to plant flowers in nooks and corners here and there and to grow vines for screens and shade will be productive of more beauty and pleasure. Have the children put some seeds in here and there that are to be their special care, and so begin training the desire to help to make the home attractive.

Plant flowers everywhere.

Small Fruits and Vegetables

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris.

In the vegetable garden as in the flower garden a little extra care is requisite at this season to insure successful crops. In preparing the soil it should first be made thoroughly wet, then worked up as soon as possible and the seed planted at once while the ground is in good condition. Any of the following may be planted with a reasonable assurance of success: Beans, corn, pumpkins, onions, cabbage, lettuce (Iceberg), beets, cauliflower, turnips, summer squash, Brussel sprouts, kohlrabi, carrot, salsify, endive and many others. For early winter vegetables plant peppers, tomatoes and egg plant.

Onions planted at this time will mature a crop in early February or March; cabbage and cauliflower, according to variety, in four and a half to six months; beets and carrots, three to four months. Plant potatoes for fall and winter crop. Practically all of last winter's crop of seed is exhausted. Use care in the selection of seed for the spring crop. Plant only that which is thoroughly cured and which shows swollen eyes. A larger piece containing more eyes is necessary at this season than for spring planting.

REMEDY FOR APHIS.

We note in the Turlock Journal a melon grower has discovered a new remedy for melon aphis. He used ten pounds of eucalyptus leaves and boiled them for some time in about five gallons of water. This solution he sprayed over the vines and says he is not troubled in any way with melon aphis. He is now spraying seven acres and finding good results.

The success of the experiment, says Mr. Cole, was most satisfactory, and now after losing seven acres of melon vines by the depredations of the aphis, he has not an aphis on his place. The eucalyptus solution has entirely destroyed them.

"The simplicity of the remedy and its very small cost will make it worth trying by every melon grower who is troubled with aphids on his vines. Another recommendation in favor of this new remedy is the fact that it is not necessary for the solution to come in contact with the aphids, as the odor of the eucalyptus oil, which is extracted from the leaves by boiling and which forms the vital part of the solution, is retained by the soil under the plants sprayed, and is death to the aphids immediately. The solution does not injure the vines in the least, and more speed can be made in treating them, as it is not necessary to exercise so much care in seeing that the spray reaches the aphids directly, the odor doing the work just as effectively."

The bran-arsenic mash is a sure cure for grasshoppers. It is made up as follows: White arsenic, one pound; brown sugar, two pounds, and bran, six pounds. First mix it thoroughly dry and then add enough water to make it a stiff, wet mash. A tablespoon of this should be placed near the bottom of every tree or shrub to be protected.

Let your neighbors know that you are in earnest about doing your part in building up the community. When they find out you mean what you say and do what you can they are apt to join you and the work will be easy. One trouble is that each of us wants the other to cooperate, but when the time comes for us to act we hesitate.

We have frequently noticed that farm life offers an opportunity for the development of a kindly spirit of charity and brotherly kindness which is the best possible example of the right sort of living.

It doesn't cost much to be neighborly, and if you learn to enjoy it, it is worth more to yourself than to anybody else. It is only the running brooklet that sings and seems to be happy.

Profit in the Poultry Yard

PANAMA-PACIFIC EXPOSITION EGG LAYING CONTEST

By I. D. Graham, Assistant Chief, Department of Live Stock.

Among all of our domestic animals and fowls there is perhaps nothing of real worth to humanity that comes more closely in contact with man to his profit than does the helpful hen.

Useful for food and as a producer of food; able to care for herself and yet responding to human attention as do few other living things; gathering the waste products and destroying our insect enemies, the hen is at once a conserver and a producer of wealth and her daily tribute is an important item in our agricultural prosperity.

The hen is the creator of approximately $600,000,000 of new wealth each year in this country and is a potent factor in the economy of all countries. In the planning of the great International Exposition, in which education is the chief motif, it is only proper that she should receive prominent consideration.

One of the chief features of the great poultry show to be held in connection with the Panama-Pacific International Exposition, as planned by Chief D. O. Lively of the department of live stock, will be the international egg laying contest, which will begin on November 1, 1914, and continue for 12 full months. This contest will be conducted by the department of live stock and under the supervision of the poultry division of the College of Agriculture of the University of California, thus giving it the most expert supervision as well as placing it under a recognized authority.

The contesting pens will each be composed of 10 females of the same variety in which the birds must be at least eight months old and not more than 11 months old on the opening day of the contest. The competition will be open to the world and all birds will be housed and fed alike.

Diseased birds will not be received and those which develop disease or vicious habits must be replaced with others of the same age and variety by the owner. Every care will be given the birds in the matter of feed and attention and every precaution taken against loss by disease or otherwise, but no responsibility for losses will be assumed by either party in charge of the contest.

Prizes will be awarded on performance and the total number of marketable eggs produced by each pen will be the basis of award. The owner of the pen making the highest annual egg record will receive a trophy and $75 in gold; the second prize will be a trophy and $50 in gold; the third prize a trophy and $25 in gold, and the fourth prize $10 in gold. The leading pen in each variety will be awarded a medal and $10 in gold.

The owner of the hen making the highest individual record will be awarded a trophy and $15 in gold; second prize, $10 and a third prize, $5. The owner of each hen making a record of over 200 eggs will be awarded an exposition trophy. Trophies will be awarded each month to the pen making the highest record for that month.

Not less than three pens must be shown in order that a variety may be represented in the contest in competition for special variety prizes. In case there are less than three entries in any one variety pens may compete in other classes where eligible. All entries will be booked in the order in which they are received and all entries will close on October 15, 1914.

All pens will be numbered and the records credited to these numbers. The name and address of the owner may appear upon the pen and in the records if desired. This will be done only upon the expressed wish of the owner, as this provision is made for the protection of those owners whose birds fail to make a creditable record. All birds must have been bred by the exhibitor, who shall be the owner at the time of the contest and who shall have owned the parent birds of the pullets entered and shown.

Any exhibitor who desires may include a male bird in each pen entered in this contest, and he may have the first privilege of securing eggs for his own use from such pen. The right is reserved by the department of live stock to select eggs for hatching purposes from pens which include male birds. A uniform charge of $1.50 per 15 eggs will be made to cover the cost of baskets, packing, shipping, labor, etc. All eggs will be packed in baskets.

All fowls to enter this competition must be shipped, express prepaid, and addressed to the egg laying contest, in care of the president of the Panama-Pacific International Exposition. No fowls will be received for this contest later than October 30, 1914. All shipments of birds properly addressed must be made so as to reach the grounds of the department of live stock of the Panama-Pacific International Exposition not later than October 30, 1914, though they may be received as early as October 1, 1914.

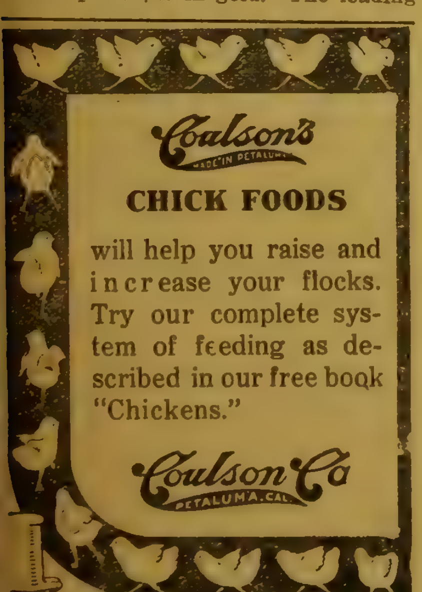
An entry fee of $25 will be required for each pen; check or money order for $10 must accompany the application and the balance of $15 must be paid on or before October 15, 1914. All payments must be made to the Panama-Pacific International Exposition and sent to D. O. Lively, chief of the department of live stock at San Francisco, California.

Hen manure stands at the head of the list in value, except that made by pigeons. Dried pigeon manure runs as high as $30 a ton. Fresh hen manure runs in value according to the feed used from $4 to $10 a ton. Sun-dried manure is worth $5 to $9 a ton, and air-dried $9 to 12 a ton.

Manures, like everything else, may do harm. They can not do harm when ordinary intelligence is employed in the use of them. All manures should be used in moderate quantities, as it is well known that to get the best results from manures they should be applied often and in small quantities.

It should be kept in mind that the best results come from a light coat put evenly on the ground after the plowing has been done, and then well worked into the soil with a disc. Pigeon manure is imported into England from Egypt, and the price reaches about $30 a ton.

The drying would lessen the freight and make the product more easy to handle. The average hen on an average ration produces about ten cents' worth of manure in a year. That will be ten per cent on her price at $1. This is the lowest estimate where hens have been penned and the excrement analyzed.—Missouri Agricultural College.



CHICK FOODS

will help you raise and increase your flocks. Try our complete system of feeding as described in our free book "Chickens."

GERMAIN SEED CO. 326 So. Main Street Los Angeles

Protect Your Chicks

Lice Eat Poultry Profits

White Diarrhoea is fatal and very contagious. It attacks chicks the first five weeks and kills 60 to 75 per cent of all chicks hatched. May wipe out your whole hatch. Save your chicks by putting in their drinking water

CONKEY'S
White Diarrhoea Remedy

Chicks drink freely and doctor themselves. Don't take chances on losing your whole hatch. Keep Conkey's White Diarrhoea Remedy on hand as an effective treatment and preventive measure. Prices 25c and 50c.

Lice are responsible for many poultry diseases, poor egg records and great loss of profits. You can get rid of them quickly by dusting your fowls with

Conkey's Lice Powder

A combination of effective lice killing ingredients. Use it on setting hens now, because it Kills the Lice—Doesn't harm Chicks. Price—15 oz., 25c; 48 oz., 50c.

Spray your poultry house and paint the roosts with

Conkey's Lice Liquid.

Thoroughly wipes out these pests that prey on your chickens at night. Qt., 35c; Half Gal., 60c; Gal., $1.00.

Guard your chicks against the deadly head lice.

Conkey's Head Lice Ointment

Kills them every time—doesn't harm chicks. 10c and 25c.

FEED AND FATTEN

Cattle, horses, hogs, chickens and all farm stock on the "Wonder Feed."

Cottonseed Meal

According to bulletin No. 11 of the Department of Agriculture, Cottonseed Meal contains 51.76 per cent of feed units—one-half of the weight is nourishment. Denton, Tex., Feb. 15, 1913.

"I have been feeding cottonseed meal and hulls to horses, mules and hogs for about 15 years. There is absolutely no other feed equal to this for keeping farm live stock in a good, healthy, growing condition, with a good appetite and sleek hair.

"Mr. A. D. Turner of this city and I have fattened thousands of sheep on cottonseed meal and hulls and have never had any trouble in keeping them in a good, thriving condition."—W. T. JOHNSON.

This is the economical feed for you to use—it produces more butter—more eggs—puts the right kind of flesh and muscle on your farm stock. Send for interesting FREE booklet—it tells "how anw why" to feed "Cottonseed Meal."

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Water and Sunburn.

You know our walnuts had sunburn last year bad, especially in interior points. An interesting occurrence was mentioned here: while myself and neighbors had sunburn bad enough, one of us was fortunate in being able to put on water. He watered first three or four days before that hot spell began and claims his nuts were very little sunburned. The rest of us began watering early. Can you draw any conclusion from this?—Subscriber, Lordsburg.

When there is ample water in the soil and the soil texture is such that the water can move in it readily, the roots of plants and trees get water more rapidly and so are able to furnish a better supply to the leaves and fruit during a period of excessive heat, which prevents burning of the leaves and fruit. The case you cite illustrates this fact and shows the necessity of always having a plentiful supply of water in the soil during the growing season.

Tomato Blight.

Can you tell me what to do to prevent or cure tomato blight? — Subscriber, Selma.

These questions are coming thicker than ever, and from them and our own garden experience this season we take it the disease is worse than usual. We assume these are cases of the true summer blight, which is not curable. The only treatment is prevention, and efforts along this line must be made before the plant is in the ground. Especial care must be taken to have the soil in which the seed is planted free from the infecting bacteria. Should these bacteria be present in the soil, then the roots are attacked, and the plant after being set out may reach considerable size, even set fruit, before showing the blight. But when it does become apparent by tops wilting, its action is very swift. The whole plant weakens, wilts, fades away and collapses. The disease quickly affects the entire field. When it begins to show, if plants are pulled out and carefully destroyed, its spread may possibly be prevented or at least retarded.

We would advise all tomato growers to write the State Experiment Station at Berkeley and ask for Prof. R. E. Smith's "Tomato Diseases in California," Bulletin 175; also S. S. Rogers' "Culture of Tomatoes in California," Bulletin 239.

Walnuts.

I should appreciate your letting me have your idea of what root stock and variety of walnut we should use in this neighborhood (between Fillmore and Santa Paula)? Have any of the blight resistant varieties been tried out sufficiently so that you would recommend using one of these? I recall distinctly that you were in favor of planting walnuts 60 feet apart. I am thinking of planting 30 feet apart to start with and then when they begin to crowd each other, take out every other tree. Do you believe we will get good results from planting walnut trees on ground which is only eight feet above water? This water—in our case—is moving river water, which I imagine would be quite different from letting the tap root go into a stagnant lake of water. We have walnut trees now about eight years old which are growing on land where the water plane is probably from nine to 12 feet below the surface of the ground. The trees are bearing well and appear to be in good health. Do you believe that these trees will begin to deteriorate later Subscriber, Sespe.

There is no doubt but that the best root for grafting or budding is the native black walnut, as it makes the best root system and is thoroughly acclimated. All my observation leads me to believe that the variety we know as Neff's Prolific walnut is the best for Southern California conditions. This is not as smooth as I would like, but the nuts are above the average size and there is less blight than on any of the so-called immune varieties. I do not have trees for sale.

If you plant closer than 60 feet, simply put a tree in the center of the 60-foot square and not 30 feet apart as you propose. If planted so close they will crowd each other before you get many nuts from them. If your water table is constant at eight feet below the surface there will be no danger from excess of water. The damage comes from a variable water table. This may be low one year and the roots follow down; then a wet year comes and the water rises until the roots are in the water and decay. Moving water is not so dangerous as standing water, but continued oversaturation will damage the trees. Your trees will do well if the water does not rise closer than six feet from the surface at any time, as a very small percentage of the roots go below that depth. You need have no fear of the deterioration of your trees where the water is nine to 12 feet below the surface, if they are kept well pruned, well irrigated and well fertilized.—J. B. N.

Employers' Liability.

I have a man working for me from one to three days in the week, doing general farm work, as hauling, plowing, feeding the hens once in a while and so forth. Am I liable in case of an accident to him under the new liability act? I have heard from different parties that this law does not include farm laborers, while others seem to be of a different opinion, saying that it includes any kind of help. —Subscriber, Arroyo Grande.

You are correct in that the farmer and employer of occasional labor is exempt from the workings of the workmen's compensation law, but on the other hand, that act and the Roseberry act have taken from the employer practically all his legal defences, so that any injury, even to the help of the farmer, gives opportunity for causing serious legal trouble. Therefore many farmers are availing themselves of the provisions of the workmen's compensation act and carrying insurance with private companies or with the state commission. We refer our inquirer to extended discussion of this point in the issues of the Cultivator of March 12 and March 19, this year.

Transplanting Orange Trees.

Is it possible to transplant two-year-old orange trees from nursery to permanent orchard after July 1st, or would it be better to let them remain until next spring? If transplanted after this time would not early cold weather in the fall prove injurious to them?—Subscriber, Springville.

If the ground is in good condition, deeply plowed, with good large holes prepared, and the trees are taken up carefully and handled so that the roots are never allowed to dry at all, we would move at once. They will become established and make considerable growth yet this season, and there is abundant time for this growth to harden before there is any danger from cold weather. We have heard citrus planters say that they care little any more at what season the trees are set out; when they get ready they plant and give heavy irrigation. The greater part of the planting, of course, is done in March, April and May.

Beetles on Budded Valencias.

I have trimmed out my navel trees and budded them over to Valencias. Some of my neighbors tell me that there is a species of beetle which often destroys the new buds. How can I guard against this? Would it not be better to paint the places where the limbs were sawed off from the trees? Subscriber, Orange.

This was referred to Mr. E. O. Essig of the state commission of horticulture, and he answers:

The beetle referred to is evidently the Fuller's rose beetle, and the best method of keeping it from young buds is to put a tanglefoot band around the base of the tree. They cannot fly and anything that prevents them from ascending the trunk is all that is necessary.

Cover Crop.

What can I plant now for cover crop which will stand the hot weather and mature so we can plow it under this fall or prior to the winter rains?—Subscriber, San Bernardino.

We would irrigate the ground as heavily as possible and plant buckwheat. If weather is good and irrigation heavy enough two crops can be raised between now and the rains. Some orchardists have succeeded in maturing buckwheat within eight or nine weeks, disking in, and the seed of the first crop has brought volunteer for the second. See article on this crop in the Cultivator of June 4. Cowpeas are also most excellent and would give greater tonnage than buckwheat if given sufficient water.

Feeding Pheasants.

Please give information as to method of caring for and feeding pheasants. —Subscriber, Santa Paula.

This, like the raising and feeding of poultry, calls for more extended article than can be given here. In a word, we may say that the feeding of young pheasants is about the same as that of young chicks. They should not be fed until after they are 24 hours old, but after the second day feed every two hours. After they are five days old number of feedings may be reduced until they are three weeks old, when they should only be fed three times daily. For first feed heat one quart of sweet milk to boiling point, stir in ten eggs well beaten and cook until curd is done. Turn off whey and this crumbly mass contains all the essential elements to young pheasant life. After that a mixture of milk, eggs and oat or cornmeal in proportion to make dry, crumbly mixture makes a fine feed. Of course boiled potatoes, greens, etc., as for chickens, is demanded. Would advise pheasant raisers to write State Game Farm, Hayward, Cal., and ask for Bulletin 1, "Pheasant Raising."

English Gooseberries

In response to request for information as to English gooseberries in California, Mr. E. C. Hall of Greenfield writes:

"Two kinds of English gooseberries do well at Greenfield, Monterey County. I do not know whether these varieties would do well in Alameda County or not. In parts of the state I am told some varieties mildew. I have tried out over a dozen kinds of gooseberries here and no mildew has yet appeared, and they have been growing here for seven years."

Mulch Under Trees

Will leaving dried weeds and grass under orange trees injure them? — Subscriber, Cucamonga.

If the subscriber means by this the growth that remains from the winter weed crop, we will say that for the sake of securing better condition of the soil we think the ground should be dug up, but once it has been loosened, the piling of weeds, leaves or any other mulch under the trees is beneficial, but do not let hard soil compacted by a season's rains remain without digging up so as to allow the air to reach the roots of the trees.

Care of Turkeys.

My turkeys get droopy when about two weeks old and we feed egg, milk curd and cornbread. They stand around and won't eat, and in a few days they die. What is the ailment and cure?—Subscriber.

The ration is too heavy and lacks the green which turkeys cannot live without. Very likely they have been overfed as well. Most of the turkeys which die under three weeks of age die of overfeeding or wrong feeding. Egg is a doubtful food for very young poults. It is apt to be constipating and should be fed only rarely and then always mixed with green feed. Corn in any form is dangerous. Cut out both the cornbread and the egg and feed cottage cheese, chopped onion and lettuce, very stale bread or rolled oats chopped with the green, and for grain a little steel cut oats or cracked wheat. A teaspoon of cottage cheese, a teaspoon of onion, lettuce and bread chopped together, with a good pinch of steel cut oats and another of fine chick grit makes an ample and satisfactory meal for a dozen turkeys two weeks old. When they are first hatched one heaping teaspoon of the mixture is enough, but it must be fed five times a day. For the first three weeks about half of each meal should be lettuce and onion, and never omit the onion. The turkey's liver is its weak point and onion is the best liver tonic. When turkeys this age once begin to droop it is practically impossible to save them. You can probably save the well ones by changing the ration and giving an extra amount of green for a few days with plenty of grit. For the sick ones you might try a liver pill or a tenth grain of calomel for three nights, with a half grain of quinine the fourth night, but the chances are they will be dead before you are through with the treatment. See to it, of course, that they are free from lice, and in perfectly clean quarters.—J. A. K.

SAVE MONEY on Irrigation Pipe

"AMERICAN" Surface Irrigation Pipe is the most economical pipe to buy. It is made of HEAVIER GALVANIZED SHEET STEEL than any other pipe, and is sold CHEAPER IN PROPORTION to quality and workmanship than any other pipe. It has NO RIVETS to pull out, but is made with the DOUBLE-LOCKED, TURNED AND SOLDERED SEAM, which is the strongest made, and CANNOT LEAK, even though the pipe be SMASHED FLAT. "AMERICAN" pipe will outlast any other and is by far the most ECONOMICAL to buy. Don't buy any irrigation pipe without getting our catalog, which explains fully the GREAT SUPERIORITY of "AMERICAN" Pipe. Remember, also, the service of our IRRIGATION ENGINEERS is FREE.

American Steel Pipe & Tank Co., 354-55-56 P. E. Bldg. LOS ANGELES

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Misrepresentation

Is this misrepresenting property and would the court reverse a deal in case of suit: "A" offered to sell 40 acres of alfalfa land, stating, "The land is likewise good for oranges and lemons, the water is very shallow and easy to get, thus a pumping plant completed would not cost more than $1000." "A" also said that if water could not be had at such cost he would give all the water wanted from his own wells. "B" has found that "A" has not enough water to irrigate four acres as it is needed, pumping only about three inches of water, and four other wells have been found by "B,' all within one-fourth of a mile from this land, which are likewise failures and will not be used or completed as the granite formation is too hard to do anything with it. "B" has had water experts, well borers and a geologist to learn as to possibilities of getting water. All of them state: "You cannot get water for less than $5000 and may be never." Now "A" has known of all these conditions.—Subscriber.

If "A" knew that his statements concerning water were false at the time he made them, and if he had no intention of carrying out his agreements concerning the giving of water from his own well and the putting of all his land into alfalfa, then "B," having purchased relying upon said agreements and representations, may, upon discovering the falsity of the agreements and representations of "A," and within a reasonable time after such discovery, rescind his contract to purchase, tender back to "A" the property and demand all that has been paid for the same. Upon the failure of "A" to accept the rescission and pay back to "B" what "B" has invested, "B' has a right of action and may enforce the rescission in court.

Probate of Property in Two States

Where one has real estate and personal property in California and several parcels of real estate in Arizona or other states and wishes to will all to one person, is the situation in any way complicated? Will the probating of the will in one state suffice?—Subscriber.

The above inquiry can be answered only in a general way, as the laws of different states differ in probate matters as well as in others. The property situated in various states can be willed in one document, executed in one of the states, and that phase of the situation presents no difficulty. As part of the property is situated in California, the will would have to be probated in California, although it might have first been probated in some other state. The same is true of Arizona, but there are some states, such as Missouri, where a certified copy of the probate proceedings of any other state can be put of record and will suffice to show the transfer of title from the deceased to the heirs.

Line Fence

I have a half section of land, boundaries defined by corner and line stakes only. There is plenty of good pasture, water, wood and a comfortable cabin, unoccupied. The property has been leased the last two years by an adjoining land owner, whose land is also unfenced. He now refuses to renew lease, saying he is going to take stock out, but fails to do so. Am I compelled to fence against his stock? Should I fence on the line could he turn his stock against my fence, he not having assisted in the fence construction or the survey of the properties?—Subscriber.

To be absolutely safe against stock you should fence your land, as you would have no redress for damage done by stock unless your land is fenced. Should the adjoining owner choose to let his land go unfenced there is no way to compel him to join in the cost of the fence, but should he at any time in the future proceed to fence the balance of his land then you can compel him to pay one-half of the cost of the division fence.

Liability of Stockholder

I own shares in a power company. The company has levied an assessment of $10 per share. Now, in case this is not paid and the shares are sold, does this release me from the company?—Subscriber, Tulare.

The sale of the shares of stock for non-payment of assessments releases the former owner from any future liabilities on account of debts incurred after the sale, but does not release such owner from liability on account of debts incurred by the corporation prior to the sale. He would still be liable for his pro rata share of such debts.

RETRIBUTION.

A Pueblo minister was greatly disturbed by a number of women in his congregation who persistently gossiped in a loud tone during services. One Sunday morning he executed a plan which he had devised to stop this annoyance. At a given signal the choir stopped abruptly on a certain word in the middle of a hymn. Then one of the gossips, unable to check herself, was heard all over the church to say: "I always fry mine in lard." "As we now know," announced the minister, "that she always fries hers in lard, we will proceed with the singing."

NO CHANCE FOR SANDY.

Sandy McTavish was sitting weeping at his fireside.

"Eh, Sandy, mon," said a neighbor, peeping in at the window, attracted by the sounds of woe, "what's ailin' ye?"

"Oh, dear! Oh, dear!" sobbed Sandy. "Donald McPherson's wife is deid."

"Aweel," said the neighbor, "what o' that? She's nae relation o' yours, ye ken."

"I ken she's na," wailed Sandy. "I ken she's no, but it jist seems as if everybody's gettin' a change but me."—Glasgow Herald.

It may not be that all things come to him who waits, but we are quite sure there is something coming to the man whose everlasting habit it is to make us wait, and we'd like to see him get it good and hard.

MONEY MAKING LITTLE LINERS

In this department we will insert your advertisement under a classified head for 11 cents per line per issue. No ad accepted for less than 3 lines. Our classified columns are the clearing house for our many thousand readers.

TREES.

Avocado Tree (Alligator Pears), the most valuable of all trees for California planting and surely the coming fruit industry. Some varieties stand more cold than oranges, grow faster, and require less care. I have several hundred fine, vigorous, field-grown trees of the Harmon variety from four to five feet tall, $3.00 each. Other standard varieties, including Taft, Walker, Ganter, Murietta, of various sizes and prices. W. A. Spinks, Duarte, Cal.

For Sale—Two-year-old Valencias and Navels, ¾ inch and up, not damaged by last year's frost. 300,000 one and two-year sour seed-bed stock. To see this stock is to appreciate its value. Address A. B. Rogers, Glendora, Cal. Home Phone 444.

For Sale—One and two-year-old Washington Navels and Valencia Orange Trees. Eureka Lemons and Marsh seedless grapefruit, for Spring 1914 delivery. Write for prices, or call and examine stock at Morris Citrus Nurseries, Cor. Juanita and Valley Center, R. F. D., Box 34, San Dimas, Cal.

The 1200-Acre Nursery, growers of 1500 varieties of trees and plants. OREGON NURSERY CO., Orenco, Oregon. Sales office, 522 Chamber Commerce, Los Angeles, Cal.

Budded Avocados, all the best varieties, other rare plants, send for Catalog. Special attention given to yard planting. Avocado trees budded over to choice varieties. Semi Tropic Nursery, Monrovia, Cal.

60,000 choice seed bed stock on leased land. Lease expires June 30. This is your chance. Butler's Morning Side Nurseries, P. O. Box 145, Lamanda Park, Cal.

1000 Avocado Seedlings—Pots, also can furnish nice plants, bare root, at low price. A. A. Quint, R. D. No. 2, Pasadena, Cal.

For Sale—Eureka Walnut Trees, budded on Native Black Walnuts. Choice stock. Order immediately. Don't delay. Wm. Holve, Fullerton, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

Wholesale Prices—Guavas, 7c; Chamaerops Palms, 5c; Date Palms, 30c; Ferns, 5c. Ballou's Nursery, Pasadena, Cal

BEES AND HONEY

It Pays to keep bees and raise your own honey on the farm. We can supply gentle, Italian bees at reasonable prices any time. Write for our free catalog of bees, instruction books, supplies and fixtures. Spencer Apiaries Co., Box 14, Nordhoff, Cal.

FARM LANDS FOR SALE.

For Sale—

FIRST-CLASS POULTRY RANCHES.

Los Angeles is the best market on the Pacific Coast for poultry products. Local Market Report of the 17th inst., says: "Receipts of Petaluma eggs are still averaging better than a car a day."

WHY SHOULD NOT THIS MARKET BE SUPPLIED BY OUR OWN POULTRYMEN?

At ZELZAH in the San Fernando valley, conditions are ideal for raising chickens, turkeys, fruit and vegetables, and the 5-acre SUBURBAN HOME is a real money-maker.

The Zelzah poultrymen invite you to join them in building up the industry there and will convince you that there is no better location near Los Angeles.

If looking for a location, investigate Zelzah. The property needs no boosting. It speaks for itself.

The land sells for $350.00 an acre and exceedingly liberal terms will be made to those who will agree to improve their property within a reasonable time.

For full information see owners.

VALLEY HOMES COMPANY,

RUN UP OLD GLORY

By W. D. Nesbit.

Run up Old Glory!
Let it blaze
In red and white against the sky
And tell the story of the days
When hearts were stout and hopes were high.
Forget the daily fights of greed;
Forget the struggles, the dismay
Of facing cruelty and need—
Run up Old Glory for the day!

Run up Old Glory!
Think of all
The old flag means to you and me,
Of how the blast of freedom's call
Shook out its fold from sea to sea;
Red with the blood that it has cost,
White with the souls of them that died—
Today by laughing breezes tossed
It whispers of a nation's pride.

Run up Old Glory!
Fling it forth
And feel anew the country call
That thrills east, west and south and north
And has its word for one and all.
Run up Old Glory—fling it far
Across the blue of heaven's dome
And feel that every stripe and star
Is warder of your hearth and home.

CAN A WOMAN SUCCEED IN HORTICULTURE?

(Concluded from last week.)

When the rainy season fairly set in we were comfortably settled in our cozy home. We had our furniture, books, pictures and piano sent on from the East, and had bought our stoves and the few extra things we needed, which made us spend $150 more.

We decided to hire our ground plowed and not keep a man. We also decided to learn to milk and care for the animals. Day after day we poured over farm bulletins on animal industry, on soils and fertilization, on almonds, on olives, figs and other fruits, on milk and alfalfa.

While we were doing all this and caring for our good Pet, and Daisy, and Peggy (for thus we had named our animals, Helen was forgetting to cough and I to jump at every noise.

Spring came, and with it our real work. The plowing had been done at a cost of $42. We decided to border our place with olives and walnuts. For the latter we planted nuts, intending to graft them later, as Anna said that this made a healthier tree.

We planned eight acres for alfalfa, as we thought that every fruit farm should also have provision made for some animals. Five acres were planted to Sultana grapes. This was because Anna insisted that we should have some. Five acres were planted to almonds, four to prunes, and the remaining three around the house were used for the buildings, a home orchard and vineyard, some small fruits and the yard for chickens.

How proud we were when the last work was done, our alfalfa field fine as a garden, our trees and vines carefully planted and cut back, but, alas! how empty our pocketbook felt.

Our fruit and alfalfa, with the probable outgo for the first year's cultivation we estimated at an average of $20 per acre, or $500. Our total expense at the close of the first year was close to $9800, which included interest on the mortgage.

We had the happiness, however, of taking in some money. We tried to take care of the animals in a scientific way and their response was a generous one.

Peggy presented us during the year with 13 cunning, snub-nosed pigs. It nearly broke our hearts to sell six of them, but we did, and they sold for $54. Gentle Daisy made during the year 540 pounds of butter that brought an average of 30 cents per pound, or $162; this beside the milk, butter and cream we used. Our hens did well also, and we sold $60 worth of eggs. We had a well-marked Holstein calf, which we kept, and 100 lively chickens. A neighbor had put out corn among the trees and vines and had paid us $100 for the use of the land.

The close of the year found our trees thriving and our alfalfa also. We put five tons of hay in the barn that we had cut from our eight acres. We paid our household bills from the money we had taken in. Our hands were not as white as they were, but we didn't care. We had been having a year of happiness, for our out-of-door work, our quiet living and regular hours had worked a miracle in health. We had done some kinds of work that we had never dreamed we could or would do, but it had been far less distasteful than we had feared.

The second year was very much like the first, except that our alfalfa brought us 40 tons of hay, which we sold on the ground for $5 a ton; we had also put ten tons in the barn.

The third year gave us a small return from our fruit. The trays and boxes for the raisins cost $175, and we had two tons from our five acres. We sold these in the sweat box for $160.

The fourth year we had more generous returns, and when our vines were in full bearing we harvested one year six tons of raisins which sold for $480, two and a half tons of almonds at 11 cents gave us $550, six tons of prunes averaged four cents, or $480. We kept three cows now; had a few hives of bees, and a fine garden of flowers and vegetables, which gave us all we used and some to sell. We kept one man all the time, who milked, kept the place free from weeds and cared for the animals and garden.

We had paid our mortgage and had a small amount of money in the bank, not a princely sum, for expenses had been heavy, and the crops had some drawbacks, but our place had doubled in value; we had health and happiness. We were friends with our neighbors, the humble ones, as well as those more fortunate in education and money; so under our own vine and fig tree, without books and work, with the busy days of sunshine and rain, and the wonderful starlit nights, with the flowers and bees and birds, with mother earth good to us, with the few outside interests we had undertaken, we learned to realize that—"God is not far from any of us!

He speaks to us in every glad surprise,
His glory floods us from the noon-tide skies;
The stars declare His love when daylight dies:
And we can hear his voice."

GOOD THINGS FOR THE FRUIT CUPBOARD

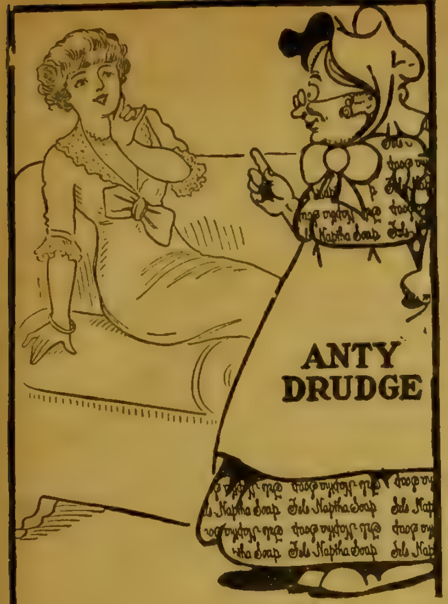
Sing a song of canning-time,
Sweetness everywhere;
Sugar, spice and all things nice
Scenting all the air.
Pickles, butters, jelly, jam,
Load the cellar shelves;
Aren't we proud to know that we
Made 'em all ourselves?
—Selected.

Pear Pickles.

Select small pears (the Seckel is a good one), pare but leave whole. They should be ripe, but not soft. Make a syrup of one pound of sugar, two pints good vinegar, one-half pint hot water and a goodly supply of mixed spices; when boiling drop in pears and cook 10 minutes, then take off the fire. Next morning drain off liquor, boil and pour over the pears. Do this for seven mornings, adding more vinegar to the liquid if it seems to need it. Put in a stone jar and weight down with a plate, cover, and keep in a cool place.

Pickled Apples.

Eight pounds of apples, pared and quartered, four pounds of sugar, one quart of vinegar, one ounce of stick cinnamon, one-half ounce of cloves. Boil vinegar, sugar and spices together, put in the apples and let them remain in about twenty minutes.



Mrs. Gay—"Anty Drudge, I'm just delighted with Fels-Naptha Soap. My washing is all done without a bit of steam or smell, and it's such a comfort to know I've gotten rid of the sickening odor of boiling clothes. I use it for John's flannels, too. It leaves them so soft and white."

Anty Drudge—"My dear, you are the third who has said that to me this morning. I'm certainly glad I told you about Fels-Naptha Soap."

You *used* to have to boil your clothes to get them clean, but nowadays progressive women all over the country use Fels-Naptha Soap. Their clothes are clean and their Fels-Naptha works best in cool lukewarm water, without hard rubbing or boiling. It is especially good for woolens because hard rubbing ruins them, and Fels-Naptha does away with all hard rubbing.

Buy it by carton or box and follow directions on the Red and Green Wrapper.

Fels & Co., Philadelphia.

FELS-NAPTHA

Put the apples in a jar, boil the syrup until thick and pour over them.

Pickled Peaches.

Sprinkle one-half gallon of sugar over one gallon and one-half of peeled peaches with a clove in each peach. Let this stand over night. Drain the juice into a preserving kettle and boil hard 15 to 20 minutes. Add two pints of strong vinegar to the boiling juice. Put the peaches in and boil all together until peaches are tender. Put the fruit in cans, pour syrup over and seal while hot.

Fig Pickles

Soak figs over night, or a few hours, in one gallon of water and a handful of salt. Remove figs from the water and boil until tender in one gallon of water and one cup of vinegar. Drain and let simmer a short time in a syrup made of one quart of vinegar, three pounds of sugar, one tablespoon each of cinnamon, cloves, allspice. Figs for pickles must not be too ripe.

Cherry Sweet Pickle.

If you have never made sweet pickles of cherries I hope you will try making some this year, they are especially fine. Pick cherries with the stems on, wash and pack in jars; boil one quart vinegar, one and one-half cups of sugar and a few cloves or allspice together, pour over cherries and seal.

> **"Where Faintheart can't, there Strongheart will;
> The blunt tool proves the workman's skill."**

Spiced Currants.

Six pounds of currants, four pounds sugar, one pint vinegar, two tablespoons cinnamon, one tablespoon cloves, one tablespoon black pepper. Put the spices in a bag. Mash the currants and put them on to boil. After cooking a few minutes strain out the currants through a colander. Add the juice to the vinegar, sugar and spices let them boil 15 to 20 minutes and pour over the currants.

Apple Catsup.

Peel and quarter a dozen apples. Stew in a very little water until soft, then rub through sieve. To a quart of the sifted apples add one teacup sugar, one teaspoon pepper, one teaspoon cloves, one teaspoon mustard, two teaspoons cinnamon and two medium-sized onions, chopped fine. Stir all together, add one tablespoon salt and half a pint of vinegar. Boil one hour and bottle while hot.

Fig Preserves.

Weigh figs and allow an equal weight of sugar. Wash them, cover with cold water and let stand for 24 hours, drain and drop them into boiling water and simmer until tender. Return to the cold water for two days, changing the water once; then make a syrup with the sugar with one-quarter of its bulk of water, add for every five pounds the thinly pared rind of a lemon and one-quarter of an ounce of green ginger; add the drained figs and simmer for half an hour, then bottle and seal.

Quince Jelly

Peel, cut and core some fine ripe quinces; put in sufficient cold water to cover and stew gently till soft, but not red. Strain juice without pressure, weigh and to every pound of juice allow one pound of crushed sugar. Boil the juice (uncovered) 20 minutes, add the sugar and boil again until it jellies—about a quarter of an hour. Stir and skim well all the time. Strain through thin cloth into jelly glasses and cover when cold. The remainder of the fruit can be made into marmalade, with three-fourths of a pound of sugar and one-fourth pound of juicy apples to every pound of quinces, or it can be made into compotes or tarts.

Green Grape Jelly

One gallon of grapes, three pounds of sugar, one pint of vinegar, two tablespoons of stick cinnamon, two tablespoons of whole cloves.

Remove the stems from the grapes, wash and drain, then put grapes, vinegar and spices in a preserving kettle and cook until the grapes are tender; turn into a jelly bag and strain. Put the juice in a kettle and cook for 20 minutes, add the sugar (heated in pan in slow oven), and cook until it will jelly; about five minutes will be needed. Seal at once.

Pickled Walnuts.

Take 100 soft nuts and prick with a darning needle to make sure they are not woody. Put them in a brine of four pounds salt to one gallon of water and allow to remain exactly nine days, changing the water every third day. Then drain and put on a dish and place in the sun until they become perfectly black, which will be in two or three days. Place in jars, which should not be filled quite full. Boil for 10 minutes sufficient vinegar to cover, allowing for each quart of vinegar two ounces whole black pepper, one ounce allspice, one ounce bruised ginger. Pour hot over the nuts, which should be entirely covered. Cover and keep in a dry place and they will be ready for use in one month. They need not be sealed.

USING THE HOME CANNERS

In canning it is absolutely essential that a definite program be followed. This gives precision to the work and eliminates many mistakes that would otherwise occur. The program given here has been found by experience to be very satisfactory. Study this program carefully before proceeding, and be sure to have all the articles listed arranged conveniently at hand ready for use.

Program for Canning Tomatoes at Home.

Prepare the canning outfit, tables, fruit, water, fuel, salt, sugar, utensils, etc., ready for use.

Scald the tin containers and fruit jars and start the work of heating and tinning the capping steels.

Scald the tomatoes in boiling water and remove skins and cores. Remove the skins at once. The scalding process is important and should be rapid, thorough and complete. Chill in cold water.

Fill the cans or jars to within one-fourth inch of the top; add tomato juice (not water), and salt and then solder the caps on the cans. Invert the cans in trays and allow them to drain through the ventholes. Weigh them as required by the pure food and drugs act as applied to the size of can and kind of fruit used.

Exhaust the cans in boiling water five to eight minutes, according to the condition of the fruit.

Remove the cans and finish the capping by closing the venthole in the tin cap.

Return the cans to the boiler and sterilize or process for 15 to 30 minutes, according to the condition of the fruit and the kind of canner used.

Remove the cans. Inspect them carefully to see whether all are air-tight. Let cool before you label.

Label, grade, number and tier or pack for shipment. Enter number, cost, etc., in your book account.

Be Free To Try An Arnott Cultivator

You have heard about the ARNOTT Cultivator, but possibly you never saw one work. Why don't you try it in your own orchard? Free trial costs you nothing. More ARNOTTS sold than any three other styles combined. Made with fore truck as shown or with pole. Curved rear standards allow good trash clearance. Made in Los Angeles as result of eleven years experience with California orchards. Cultivates deeper. Pulls lighter. High-grade steel construction. Write today for free trial offer. Cultivators shipped everywhere. None returned.

ARNOTT & CO. EST. 1892 112-118 S. Los Angeles St. LOS ANGELES, CAL.

DAISY FLY KILLER placed anywhere, attracts and kills all flies. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Sold by dealers, or 6 sent by express prepaid for $1.

HAROLD SOMERS, 150 DeKalb Ave., Brooklyn, N. Y.

MOUNT TAMALPAIS MILITARY ACADEMY

A school for boys in which a military system of government, and military methods of physical training and moral discipline are used for building up the character. For twenty-four years these methods have been remarkably effective in awakening and calling into exercise the moral powers of the boy and of great value in preparing him for the sterner duties of life when he leaves school. A thorough high school course. Commercial branches. Separate Junior School for younger boys. Open-air gymnasium and swimming pool. Fully accredited to the universities. U. S. Army Officer. Infantry, Cavalry, Mounted Artillery. For catalog address Twenty-fifth year begins August 18, 1914.

HAY

Under date of June 27, Scott, Magner & Miller say:

Receipts of hay for the past week were 2,540 tons; last week, 1,597 tons. Very little interest has been shown during the week. Consumers are not ready to lay in any quantity as yet, and receipts have been hard to dispose of to advantage. Fancy Wheat and red oat of the old crop are extremely scarce, the majority of the old crop arriving being of the medium or poorer grades. The first two cargoes of new second cutting alfalfa from the river arrived during the week, but it has been very difficult to place as dairymen are not laying in any stocks as yet. A few carloads of new straw arrived and were offered at 50c. No change in prices to note during the week.

We quote the average wholesale prices on carload lots of hay on today's market as follows:

Fancy Wheat Hay, lt. bales	13.00@14.00
No. 1 Wheat or Wheat and	

Oat	11.00@12.00
No. 2 Wheat or Wheat and Oat	9.00@11.00

Citrus Fruit Market

LOS ANGELES, July 1, 1914.

Shipments of Valencias to July 1st were practically normal, that is, 35 per cent of the fruit had been forwarded at that time. Navels are practically cleaned up; a very few Mediterraneans yet to go. The next few weeks will probably be the most trying during the entire season; the supply of peaches and all small fruits is large, and all markets are now well supplied. A little later the orange will come to its own and better prices may obtain. For the present the waiting game is the only one to play. Cooler weather and immense quantities of foreign lemons are combining to depress lemons slightly. The middle west is, however, receiving large quantities at satisfactory prices.

Shipments.

Shipments of oranges from Southern California to date since November 1, 1913, 31,003 cars; lemons, 2,189; total, 33,192. To same date last season, 11,756 oranges; 1,734 lemons; total, 13,490. Total of all citrus fruits from this state two years ago, 29,612. From Tulare county this season, oranges, 5,854, cars; lemons, 30; total, 5,884. To same date last season, oranges, 1,855 cars; lemons, 107; total, 1,962.

NEW YORK, June 29.—Twentyfive cars Valencias, 15 navels, 5 sweets, 1 seedlings, 1 St. Michaels, 8 mixed cars sold. Market strong and higher on all varieties. Cloudy.

There are still some people who imagine they can tell the sex of eggs before they are hatched or as soon as they are laid. Some tell us that long eggs always hatch females while others say that such eggs invariably hatch males. When it is considered that each hen shapes her eggs according to the condition of her ovaries, and uniformly lays eggs of similar shape, the absurdity of the shape theory becomes apparent.

In Paris markets the eggs are dated and one pays according to the freshness, so that it is possible to be certain of newly-laid eggs; or if it is necessary to be economical, yesterday's eggs or the day's before are offered at a reduction.

There is almost as much difference between families or strains of each breed as between the different breeds. Therefore, receive with some allowance the praise or condemnation of any breed.

Books

This list of helpful, instructive and interesting books is prepared by us with the purpose of enabling the Cultivator readers to supply themselves at the lowest possible cost. The great value of many of these is so well known as to need no comment from us. Some of the new books which we have added to the list this year deserve special mention. "Co-Operation in Agriculture," by G. Harold Powell, should be in the hands of every producer of farm products. "Farm Sewage," by Santee, will aid many in solving a perplexing problem. "Farm Manures," by Thorne, is decidedly valuable. We state sincerely that no orchardist can afford to get along without "The Pruning Book," by Bailey. We have had much inquiry for a book on keeping farm accounts—we can supply a good one now. The imported book, "Insecticides, Fungicides and Weedkillers," by Bourcart, is a marvel of completeness. The rapidly increasing use of gasoline engines, automobiles and tractors by the farmers has demanded reliable treatises on these subjects. "The Gasoline Engine on the Farm," by Putnam, "The Modern Gasoline Automobile," by Page, and "Traction Farming and Traction Engineering" are exceptionally complete, well illustrated and easily understood. Don't overlook the "Cement Workers' Handbook"—it's "worth its weight in gold." Every book on this list has the endorsement of the California Cultivator.

G-E ELECTRIC MOTOR For RANCH AND FARM

As long as power is supplied this motor runs without attention other than refilling its reservoirs every month. This motor is belted to a 6-inch vertical pump on the ranch of Mr. Edward Gilman, at Edenvale, Cal. This is Mr. Gilman's second purchase of a G-E motor. He will tell anyone what he told us:

> GENERAL ELECTRIC CO.,
> San Francisco, Cal.
>
> Gentlemen:—
>
> I have used a General Electric motor to irrigate my farm and orchard for the past two years and have not had one moment's trouble or any complaints. I have left it running for hours without even thinking of it. I have unlimited confidence in the motor and can highly recommend it.
>
> Yours very truly, (signed) ED. GILMAN.

Write today for our interesting free booklet about ranching and farming with electricity.

California Cultivator

Rural Californian combined with California Cultivator

Vol. XLIII No. 2 LOS ANGELES: THURSDAY, JULY 9, 1914 One Dollar Yearly

Table Grape Shippers Are Sensible

They Are Combining to Insure the Shipment of Only First-Class Ripe Grapes Which Shall Contain at Least 17 Per Cent of Sugar. Form of Contract Which is Being Signed Up.

A most sensible movement is under way in the San Joaquin Valley amongst the table grape growers. They suffered greatly last year because unscrupulous shippers persisted in forwarding unripe, sour grapes, some of which sold for good prices, but because of inferior quality destroyed, or at least greatly injured, later markets.

To aid in correcting this the California Green Fruit Association has been organized, and at a meeting recently held in Fresno the following contract was indorsed and signed by many:

Standardization Contract

This agreement made and entered into this 29th day of June, 1914, by and between the California Green Fruit Association, having its principal place of business at Fresno, California, party of the first part, and the undersigned green fruit shippers doing business in the territory hereinafter described, parties of the second part, witnesseth:

That during the shipping season of 1914 the undersigned shippers, parties of the second part, agree not to accept for shipment, nor to ship outside of the State of California, from the territory covered by this agreement, any Malaga, Thompson or Muscat grapes containing less than seventeen per cent (17 per cent) sugar as determined by Balling's saccharometer.

And the said parties of the second part further agree to use their best efforts through their representatives and managers within the territory covered by this agreement to secure the shipment of sound merchantable fruit only; and all parties thereto also agree to use their best endeavors throughout said territory to secure the shipment of sound merchantable fruit only, and to secure the acceptance and the signing of this agreement by all firms and individuals shipping fruit from or handling fruit within said territory.

The district and territory above referred to within which this agreement shall be operative shall be the San Joaquin Valley, from the southerly line of San Joaquin County south to Bakersfield.

In order to facilitate the carrying out of the terms of this agreement, it is further mutually understood and agreed by and between the parties hereto that there shall be employed by said party of the first part a chief inspector, and such other inspectors as may from time to time be necessary in order that there may be one inspector at each shipping point within the territory covered by this agreement, unless in the opinion of the chief inspector two or more points are sufficiently close together to be effectively covered by one inspector, in which case there shall be but one inspector for said points so in proximity to each other as aforesaid; the employment of said inspectors to continue so long as in the judgment of the executive committee of the California Green Fruit Association the condition and shipment of the fruit herein referred to shall warrant the same.

It shall be the right and duty of said inspectors to inspect all fruit at place where the same shall be packed, in order to ascertain that said fruit is up to the standard established by this agreement, and any of the grapes covered by this agreement and found to contain less than seventeen per cent (17 per cent) sugar as herein provided shall be refused, and shall neither be accepted nor shipped by any of the respective parties of the second part. Should, however, any dispute arise between any inspector and the party of the first part, or any of the respective parties of the second part or any grower of grapes covered by this agreement, then and in that event the chief inspector shall be called in to determine such dispute and the judgment and determination of said chief inspector in the premises shall be binding and conclusive upon the parties thereto.

After any of the grapes covered by this agreement shall have been inspected and passed by any of the inspectors employed as herein provided for, then each crate or package containing such grapes so inspected and passed aforesaid shall be by the shipping company receiving such fruit for shipment stamped with a rubber stamp containing the words: "Inspected as to ripeness by the California Green Fruit Association."

In order to facilitate the inspection of the fruit as herein provided, it is expressly understood and agreed that all of the inspectors aforesaid shall have access at all times to any packing house or packing shed owned or controlled by any of the parties hereto, and to the grapes therein situate, for the purpose of inspecting said fruit and making tests thereof. Also shipping companies shall notify chief inspector at his office twenty-four hours before packing or shipping commences at each or any point.

All of the inspectors herein provided for shall be employed by and be under the supervision and direction of the party of the first part, and their compensation shall be fixed by said party of the first part. One half of the cost of such inspection, including the compensation of such inspectors, shall be paid by said party of the first part, and the remaining one-half thereof shall be paid by the undersigned shippers, each of the said shippers paying such proportion of said one-half thereof as the amount of fruit covered by this agreement and shipped by him bears to the whole amount of such fruit shipped. Said payment of said one-half of such costs to be made by said shippers as follows: Each of said shippers shall make to the said chief inspector, (to reach said inspector not later than twelve o'clock noon on each Monday during the season covered by this agreement), a report of the numebr of crates of each variety of grapes herein referred to shipped by such respective shipper during the previous week, and said chief inspector shall upon such reports apportion the proportionate costs of such inspection to the respective shippers, parties hereto, and immediately thereupon send to each of said shippers a notice setting forth the total number of crates of each variety of grapes covered by this agreement shipped by all of the parties hereto during said preceding week, together with the total cost of inspection during said preceding week, and the amount due from the respective shipper so notified as his proportionate cost thereof, and upon receipt of such notification the amount specified therein shall be immediately paid by said shipper to said California Green Fruit Association. A final apportionment covering all matters not previously included shall be made at the end of the shipping season.

It is understood and agreed that this agreement is intended to cover only shipments outside of the state of California from the territory hereinbefore specified in this agreement.

This agreement is reduced to writing for the purpose of having the terms and conditions thereof fully and clearly understood by and between all of the parties hereto. The fulfillment of this agreement is left to the honor of each of the respective contracting parties, and the penalty for violation of this agreement is the forfeiture thereof by such violator.

In witness whereof, the parties hereto have hereunto set their hands and seals the day and year in this agreement first above written.

A Letter

In order to secure as liberal support for the above contract as possible and to save expenses, the growers are appealed to through the mails in the following letter.

Mr. Green Fruit Grower:

This letter refers to your business particularly and we ask you to give it consideration.

The first cost for freight, icing, packing, loading and selling commission on a car of east-bound grapes runs up to the neighborhood of $700 to $750.

This first cost has to come out of your grapes before you get any money for your product, unless you sell cheaply enough for cash to induce a speculator to buy from you.

Only a small percentage of the crop is purchased by speculators under any circumstances.

With the increased Malaga acreage coming into bearing, any one year of a full crop (and the present 1914 indications point to a full crop) will present problems that can be met with any degree of success only by the growers organizing, to the end that numerous abuses of the past may be corrected.

The California Green Fruit Association has been organized for this purpose.

The capital stock is only $25,000. No one is eligible as a shareholder except a bona fide grower of green fruit (trees or vines). The stock will be issued in $1.00 shares. Growers can subscribe for one share for each acre of shipping fruit owned.

The board of directors is composed of 15 growers so that every part of the green fruit district can be represented. No salaries or fees are paid to any officers or directors.

You, as a shareholder with other growers, who now are stockholders, will be in control of this company and dictate its future policy.

Why was this company organized?

It was organized for the purpose of consolidating the growers of fresh shipping fruits, in the Malaga belt of the San Joaquin valley, so that a united front could be presented against any interest, or interests, acting to the detriment of the grower's end of the green fruit industry.

No matter how small your acreage may be, your welfare is concerned in this movement. Your acreage with numerous other small parcels aggregate thousands of acres and the only way in which you can be heard is to combine with your fellow growers and present a united front and demand a correction of a number of existing abuses which threaten your prosperity and that of every other grower of shipping grapes.

The growers who formed the California Green Fruit Association are more or less dependent on the returns from their shipping grapes. They have keenly realized in the past that as the increased acreage came into bearing the present system of marketing followed by the middlemen (while insuring full pay to the transportation companies, packing companies, and the eastern auction companies), threatens to leave little or nothing for the actual producer. They realize that a few growers alone could not command the respect of the middlemen and insist successfully on the correction of patent abuses in their distributing methods.

To get the green fruit growers in this district together and qualify their spokesman to speak with a 2000-carload voice would make a noise loud enough to be heard in Sacramento and as far as the New York city auction rooms. After securing a hearing, self interest on the part of the middlemen will actuate them in cooperating with our association to eliminate any and all abuses in the trade.

The above answers the question why we organized.

Self interest on your part dictates that you join our association and hold up our hands. The work our association proposes to do means more money for your crop year after year. To let matters drift as they have in the past means assuredly red ink for you and hundreds of other growers.

What Can the California Green Fruit Association Do?

It can compel the middlemen to adopt a more scientific system of distribution in order to prevent gluts in the auction rooms and consequent ruinous prices for your grapes.

It can help to widen the private sales market in order to reduce surplus quantities of grapes being dumped into the auction rooms for any old price such a situation would bring.

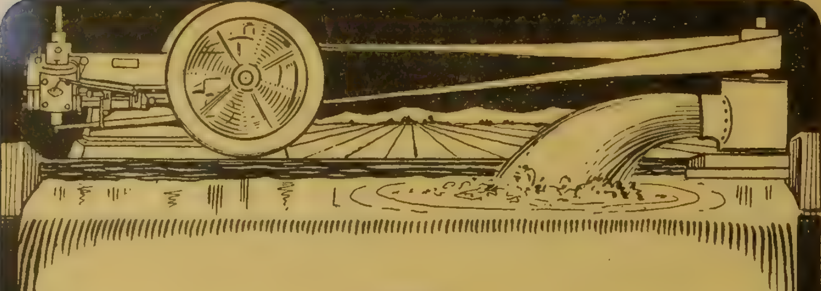
Where packing charges, transportation charges and icing charges prove exorbitant after investigation, the association will be powerful enough to secure just reductions.

Where undue charges are being made against our product in the eastern auction rooms, this association will be strong enough to correct such abuses where they may exist.

With proper support from the growers we can stop the shipment out of this belt of early green sour grapes, a practice which reacts at a loss to every grower, the shipper of sound sweet grapes as well as the shipper of sour grapes.

We propose at the next meeting of

(Continued on Page 43.)



THE

Western Gas Engine

Reduces Power Bills, Eliminates Trouble and Gives Constant, Efficient Service

No engine on the market has attained the marvelous success made by the Western Gas Engine here in the West. It is without an equal, whether for heavy irrigation, light ranch work, or other power requirements. The very highest authorities on gas engine construction recommend the Western, because every detail of its construction is correct.

The immense number of Westerns in operation throughout this portion of the country is evincive of their popularity. A Western will save you money and you can absolutely depend upon it at all times.

Many types and sizes from 4 to 180 horse power

Citrus and Tropical Fruits

THE NEMATODE WORM ON THE ROOTS OF CITRUS TREES

By E. E. Thomas, Before Citrus Institute at Riverside.

For a number of years the citrus growers have been concerned with a very obscure trouble which attracted attention, especially in the older sections. This trouble has generally been called mottle leaf, as one of its characteristics is the yellowing of the leaves between the veins, with the green color only along the mid rib and lateral veins, giving the leaf a mottled appearance.

So prevalent has this become throughout all of the citrus sections, and especially among the older groves, that a project was outlined for the study of this problem. Among other points to be investigated was that of possible parasite injury to the tree.

Upon careful examination the roots of many citrus trees were found to be infested with nematode worms. These were first brought to the writer's attention by J. R. Hodges, horticultural inspector of Covina, who had found nematodes in the soil scraped from the roots of trees with badly mottled leaves. Twice previously nematodes had been reported in connection with citrus trees. The common root knot or garden nematode "Heterodera radicicola" was reported as occurring on citrus roots by J. C. Neal in 1889 and a closely related variety was also reported on citrus roots by Gaston Lavergne in Chili.

The nematode, which is a microscopic worm living in the soil, has been a problem for many years. Up to the present time many varieties are known, and they have been the subject of much study on the part of scientific men all over the world.

Two of the most common varieties are the "Heterodera radicicola," or root knot nematode, and the heterodera schachtii, or beet nematode.

The first attacks the roots of plants, causing the root to swell and form a knot or gall. Upon breaking open one of these galls one will see a pearly white pear-shaped object about half as large across as a pin head. This is the adult female. Each female is capable of laying several hundred eggs, 500 having been counted by Dr. E. A. Bessey, professor of botany in Michigan agricultural college, who has made a very extensive and thorough study of this variety.

Upon hatching the young larva will enter the soft-growing end of a root by the aid of a spear with which it is provided and proceed in many cases to the center of the root: Here the females will develop, causing more knots on the roots.

This variety is very harmful to practically all garden plants and is also found on many trees. It has been found in nearly every country of the world and in some localities is so abundant that varieties of plants susceptible to its attack cannot be grown with any success.

The other variety mentioned, the beet nematode, is also widely distributed, especially in beet growing districts. Unlike the root knot variety, it does not form knots or galls on the roots. The female, which is lemon-shaped and of a brownish color, is not found entirely within the root, the anterior portion only is imbedded in the tissues. Beets affected with this nematode are stunted, and if a field is badly infested it is worthless.

From these two varieties alone we find that nematodes sometimes damage the root of the host directly, not only by crawling inside the tissues and causing knots, but also by piercing the root with the mouth parts and feeding upon it.

The citrus nematode, which has been named "tylenchulus semipenetrans" by Dr. N. A. Cobb, of the United States department of agriculture, while similar in some respects to those already mentioned, belongs to another genus and has its own individual characteristics.

One point stands out very clearly, and that is the fact that the citrus roots do not develop galls or knots, so far as observed by us. This is, therefore, different from the cases noted by J. C. Neal and Gaston Lavergne, in which they state that galls or knots were found on the roots.

On close examination of our specimens it has been found that many of the nematodes pierce the root and push their way into the tissues for quite a distance. In some cases the head of the nematode was seen to have penetrated six cells into the root. Upon further examination it has been found that the number of nematodes which pierce a rootlet is very great. In some cases as many as 60 have been counted on a rootlet no larger than an ordinary pin one inch long.

The females are of a slightly brownish color and when mature the main portion of the body is irregularly elliptical and not quite symmetrical, the posterior portion narrowing abruptly into a slender obliquely placed tail.

They are not always attached to the root, but may be in the soil surrounding it and seem to be enveloped in a gelatinous or slimy material. A number are generally to be found together, with this gelatinous material surrounding the whole group. This enveloping substance is probably a protection for the eggs and young larvae.

As many as 20 females have been noticed attached to the root in one group. This bunching or grouping not only occurs with the females, but is also noticeable with the males, for they are very often found in groups of from six to eight or more, piercing the root close together. Many groups have also been seen in which there were both males and females, with the anterior portion of the body imbedded in the tissues of the root. Cross sections of the root have been made and the nematodes were seen penetrating the tissue.

Although not always a sure indication that a rootlet is infested with nematodes, a very suspicious symptom is the fact that the soil particles cling to the root and do not readily fall off when it is shaken. This is due to the fact that the soil grains cling to the gelatinous material and in many cases will not be removed when washing the roots in water even with a moderately fine brush. Very frequently upon microscopic examination a group of nematodes is found attached to the root at this point.

A very incomplete survey of the distribution of the citrus nematode has been made in California, and it has been found in all of the principal citrus districts of the state, from San Diego county in the south to Butte county in the north. Since the publication of circular No. 85, issued in February of the present year by the agricultural department of the University of California, entitled "A Preliminary Report of a Nematode Observed on Citrus Roots and Its Possible Relation to the Mottled Appearance of Citrus Trees," the citrus nematode has been found at Valencia, Spain, in three countries of South America, in Florida, Alabama, in the gardens of the United States department of agriculture at Washington, and probably at the present time in many other sections.

Trees infested with the nematode are found on varying types of soil, but as a general rule groves in a sandy or sandy loam soil are much more affected than those on a heavy soil. In some cases, however, the nematodes have been found in large numbers on the roots of trees growing in heavy soil, but at present this is not general.

There are a number of ways in which these nematodes might be carried from one tree to another or from one district to another district miles away:

The nursery stock may be affected in the nursery and when the trees are planted the soil of the new grove becomes infested also. This, of course, would especially be the case if the trees were balled in the nursery and planted this way. If the trees were planted with bare roots the number of nematodes introduced into the soil would be greatly diminished, but a few would be carried on the roots. A few cases in which they have been carried on the nursery stock have been noted, and groves located in different sections which were planted with stock from an affected nursery have been found to be badly infested with the nematode.

They may be carried by the irrigation water and rains. This has been noted in a number of cases. In one instance they have been carried for three-fourths of a mile, if not more, by this agency, as the trees first affected are in the highest grove on a hillside, and a narrow strip through five different groves is affected below them. This strip follows a slight depression through which all of the waste water as well as the storm water would run. On either side of this the trees are not affected to nearly so great an extent.

The nematodes may be carried on the cultivator, wagon wheels, horses feet, or any agency which would be able to carry soil from one place to another, and when a grove is once infested it may quickly spread from one section to another.

At present the exact damage caused by the citrus nematode is not known. We have a large number of observations as to the appearance of the trees badly affected with the nematode, but we do not know what other elements aside from this parasite may have figured in the process as determining factors. One fact is clearly demonstrated, that in a very large percentage of cases the feeding roots may be greatly damaged, not only by the nematode attack itself, but also by a fungus or various fungi which are enabled to enter the root where it is weakened by the nematode puncture.

In order to ascertain the extent of injury caused by the nematode, a series of pot experiments are being started. This experiment will be composed of 800 to 1000 plants including about a dozen different varieties of citrus stocks. In most cases, the seed will be planted in soil which is known to be free from the parasite and after the trees are started and all as nearly uniform as possible, one-half of them will be inoculated, while the other half will be kept free from their attack. The trees will otherwise be given the same care and the results carefully noted.

Work is also being conducted on the fungus to see if it alone would injure the tree.

As to the remedy for this pest very little can be said, for at present practically nothing is known.

With the beet and root knot variety a number of different methods for their control have been employed with more or less success. Among these is the application of carbon bisulphide to the soil after the crop has been harvested, but owing to the great expense this is only used where but a small portion of the field is affected. It cannot be applied around growing plants as the roots as well as the nematodes are killed. Where the parasite is scattered over a large area a beneficial practice is to plant simply a crop of some quickly growing plant the roots of which are very susceptible to the nematode's attack. A careful watch is kept of the crop and at the time when the larvae are most numerous and before maturity is reached it is pulled up and destroyed. In this manner large numbers of the pest are killed and they are thus held in check so that a profitable crop may be successfuly grown, even though the nematode is not entirely eradicated. Many chemicals beside the one already mentioned are very often used with more or less beneficial results.

Some of these methods have been successfuly applied on soil which at some season of the year is free from a crop. They have also been used on perennial crops having a dormant season, with varying results.

With citrus trees, however, a very difficult situation arises from the necessity to kill the nematode without injury to the root which is never dormant but grows at all seasons of the year. This is one of the problems that must be solved. As yet no method is known by which this can be accomplished. Experiments for this purpose will be carried on, and it is hoped that it will not be a great length of time before a remedy is found and the nematode is under control.

"I Can" is a hustler, a man self-made
Who turns off jobs galore;
"I Can't" lights his pipe, sits down
in the shade,
And bemoans the fact that he's poor.

FUMIGATION OF OLIVES

We are glad to give below a communication received from Eupope regarding methods of work on the olive in Spain. The olive industry of much of the Mediterranean country is being jeopardized by the lethargy of the growers regarding insect depredations. The more enlightened are finally awaking to the necessity of thorough work. One large firm at Valencia has published a table giving amounts of cyanide of soda for various fruit trees, almost identically the same as the Woglum schedule except that the numbers given instead of representing ounces give the measurements in grams and of course the distance over and around the trees is expressed in meters.

Our information received is through the Frankfort house of the Roessler and Hasslacher Co., and is as follows:

"Professor Woodworth seems to be of the opinion that the fumigation of olive trees will be of no particular importance. From the experiences we have gathered in Spain we must very positively oppose this judgment. Only very recently we have fumigated olive groves in Toledo and reached thereby very good results. For that purpose 15,000 kilos of sodium cyanide have been sold. Quite a nice quanity when you consider that fumigation found footing in Spain only two years ago.

"In Spain it has occurred, especially in the province of Toledo, that the Phloeotrips oleo has done great damage. What insects will have to be combated in the olive plantations of Italy we can not at present exactly say; the Italians name it 'mouches des olives' (olive fly). It is the 'Saissetia olea,' which also has strongly invaded many districts of Spain.

"At Toledo the campaign against the Phloeotrips was finished after having fumigated 30,000 olive trees with excellent results; which gives me hopes that in the next year there will be more fumigating and the formation of new companies which will require more equipment.

"While we lament being unable to state to you yet "the substantial monetary gains" in olive fumigation, we may positively conclude that the profit remains to the planter, otherwise they would not have started new fumigation companies, especially among the slow Spaniards.

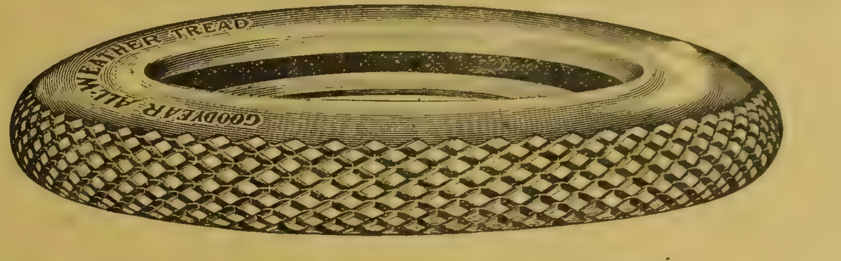
"The result is that the value of crops of 68 orchards gives a total of 22,290 trees during the years 1910 and 1911, and before being fumigated was, more or less, Pts 121,888, while the crops of the same 68 orchards, or 22,290 trees, gave during the year 1912. after being fumigated, a larger crop, amounting to Pts 189,833.

"The net increase of crop after deducting the cost of fumigation was 36 per cent."

AVOCADOS IN SAN DIEGO COUNTY

Mr. M. F. Maurer of San Diego County reports the planting of 250 avocado trees on the mesa lands within a short distance of the Pacific. The orchard is owned by Messrs. Oscar Maurer of Berkeley and Dr. Charles W. Fish of Los Angeles. Fine large six-foot trees were planted. Mr. Maurer writes: "The whole district of Del Mar, near which the orchard is located, has been deeply interested in the new venture, and many visitors view with envy the brave little orchard, waving in the soft southern breezes."

Don't fail to advertise. Not every man that fails to advertise fails, but he fails to do his best in business.



These Costly Tires
Now Undersell Nearly Every Make

The tables are turned. Goodyear No-Rim-Cut tires—once the costly tires—now sell below most others. There are 16 makes sold at higher prices—up to one-half higher.

Now these tires which rule Tiredom—the leading tires of the world—save you on first cost as well as on last cost. It is more important than ever to get them.

Reasons for Cost

No-Rim-Cut tires for a long time cost one-fifth more than other standard tires. That was due to four great features—costly features—found in no other tire.

They ended rim-cutting by a method we control. It has saved tire users millions.

They saved blow-outs—all the blow-outs due to wrinkled fabric. They did this through our "On-Air" cure—an extra process which costs us $1,500 per day.

They reduced loose tread danger by 60 per cent through a patent method.

Our All-Weather tread gave to users a tough, double-thick anti-skid. A flat tread, as smooth as a plain tread, but grasping wet roads with deep, sharp, resistless grips.

No other tire at any price has ever offered these four features.

Reasons for Price

The reasons for present Goodyear prices are just these:

New factories, new equipment, new machinery, new efficiency. A multiplied output, now the largest in the world. It has cut overhead cost 24 per cent and labor cost 25 per cent.

A modest profit. Last year our profit averaged only 6½ per cent.

No-Rim-Cut tires at present prices are even better than they were at high prices. They excel other tires just as far, and in just as many ways.

Up to now men bought these tires because of their hidden economies. They bought millions of them because of their known mileage records.

Now you have in addition this visible economy—this saving which comes at the start. You have a price from $5 to $15 lower than many other tires.

Marketing!!
That's the Problem

It matters little whether you have to sell a carload of corn-fed steers, or a bushel of onions, the problem is before you. And you must meet it. Here's a concrete illustration:

Why Is It So?

"When the farmers of Kansas are feeding Elberta peaches to their swine, rather than to haul them to a 15-cent market, the housewives of Chicago and the great Northwest are paying one dollar a peck, $3.50 a bushel, for the fruit."—A news item.

This absorbing problem was threshed out to exhaustion in the Great National Conference on "MARKETING and FARM CREDITS," held in Chicago in 1913. The ablest men in the World participated in the deliberations and discussions.

232 Solid Pages

The report of this week's work, reduced to the very quintessence of Argument, Reason and Conclusion, makes a book of 232 pages of rare merit. It is full of the "why" of marketing, and it is put in very readable form—so plain that any one may read it for entertainment. Richly printed; cloth bound.

Only 1000 Copies

left, while there are 1,000,000 farmers and economists in this country who need and really want them. Price is just $1.00, postage included. During the month of July, 1914, these desirable books go onto the Bargain Counter to our subscribers. New subscribers or renewals are treated alike.

Deciduous Fruit Culture

THE WALNUT SITUATION

By California Walnut Growers' Association.

So many conflicting statements concerning the extent of the coming walnut crop are being published that we have deemed it proper at this time to advise you as to local crop prospects as we find them after a very thorough canvass of the entire walnut producing district of California.

It is undoubtedly true that the production per acre in many districts will be extremely light, but the walnut acreage in Southern California has greatly increased within the past few years so that a comparatively light crop will now bring the same tonnage as was produced by a normal crop just a few seasons back. A normal crop should now run nearly 30,000,000 pounds, as may be seen by making the following comparison: In 1911 there were 27,200 acres of bearing walnuts in California. The crop totaled 25,000,000 pounds, or about 900 pounds per acre. There are now approximately 33,000 acres in bearing. The same crop per acre would produce 29,700,000 pounds.

Up to the present time all conditions have been almost ideal for the growing nuts. The spell of hot weather experienced here in September, 1913, killed much of the fruit wood on the walnut trees, which caused a generally light setting, but the fine growing conditions we have had all season have brought the nuts up to very large sizes so that the weight per nut will probably be 25 per cent over last year's average. In 1913 the shipments of the California Walnut Growers' Association averaged 28 per cent No. 2's. Our estimate this season is but six per cent No. 2's. Barring the remote possibility of another freakish hot spell, California will ship the finest walnuts this year that have ever left the state.

Our present estimate for the coming crop is 10,529 tons, of which we estimate 7385 tons will be shipped by the associations and 3144 tons by all other shippers, which figures do not show any great falling off from other years, as evidenced by the table below and show an actual increase over 1913 shipments of first grades:

Year.	Pounds shipped.
1903	12,678,248
1906	15,096,887
1909	18,695,686
1911	25,070,340
1912	22,431,982
1913	*22,378,354
1914 Estimated	21,058,000

*Including 1,250,000 pounds off grades.

Beyond doubt the harvesting of the California crop will be at least 10 days earlier than usual and the association is hoping to complete all shipments not later than November 20th.

Summing the situation up from the trade's point of view, the season promises to be a most satisfactory one all around, excellent quality, large sizes and an early harvest. Then, too, the growers' ideas of prices are more conservative than they were a year ago. They are realizing that they must sell at a price that will permit the dealers to make a decent profit. While it is, of course, impossible to talk definite figures at this time, it is safe to say that the prices when opened will prove attractive to the trade. We have restricted the acceptance of S. A. P. orders even below the contract provision and therefore expect to make 100 per cent deliveries on all orders confirmed.

It is pleasing to report that last year's light carryover is rapidly moving out. Over 50 per cent of the associations' holdings have been sold in the last 60 days and the new crop will find a practically bare market.

Two additional local associations, the El Monte Walnut Growers' Association and the Garden Grove Walnut Growers' Association, have this year contracted with the California Walnut Growers' Association for the exclusive marketing of their output, thus materially increasing our tonnage. This gives us the marketing of the output of 18 local associations.

We have now secured a reduction in rate for canal shipments to the principal eastern seaboard ports. The new rate is 55 cents per 100 pounds. With insurance, freight from packing house to Los Angeles harbor and dockage, the total carrying charge on such shipments will run to about three-fourths of a cent per pound. We are still expecting a further reduction in the water rate to 50 cents.

Some of our large importers have been working faithfully during recent seasons in an endeavor to favorably introduce the Chinese (commonly called the Manchurian) walnut into this country. Last season their efforts were in a measure rewarded. The quality of these nuts was better than in former seasons. It is not our purpose here to compare the keeping qualities, hard shell, percentage of meat to shell, or difficulty in removing kernels of the Chinese nut as against the California walnut. These matters we leave to your own judgment. There is a certain trade that demands a lower priced walnut; the Chinese nut possibly fills this demand. We simply wish here to give you an idea of the extent of the industry in China in comparison with the American consumption. The average consumption of walnuts in the United States is now over 60,000,000 pounds annually. In 1912 the exportation of walnuts from all Chinese ports to all countries, as compiled by U. S. consular service, was 6,812,000 pounds, less than 12 per cent of the consumption of this country alone. The 1913 Chinese crop was one of the heaviest on record, many districts showing 100 per cent production increase over 1912. Imports to the United States were the heaviest ever made, approximately 5,200,000 pounds for the 12 months to June 1, 1914. The most authentic estimate we are able to obtain at this time places the total 1913 production of Chinese walnuts, all grades, at 8,140,000 pounds. From the above it will be noted that the bulk of the Chinese production is already being imported to this country. Most of those nuts which are not brought in here are of the poorer quality. In line with this we quote from a reliable report received from Chefoo, China:

"The best walnuts shipped from this province (Shantung, one of the largest walnut producing provinces) come from the southern section. Shippers tell us that the business is risky for the reason that the nuts do not run even. . . Most of the nuts go to Austria, Holland and Germany. They grow mostly wild in this province, that is, it can scarcely be said that they are cultivated for market purposes."

Early reports indicate that the 1914 Chinese crop will be a trifle lighter than last year. Twenty-five hundred tons will be the probable limit of imports if the quality can be held up to last year's standard. Of the importations of 1913 crop Chinese walnuts, 67 per cent arrived in port after January 1, 1914. The amount available for the holiday trade is therefore infinitesimal, and the total possible imports of Chinese nuts for a full season are comparatively too small to be a strong factor.

Our regular European representative leaves on an inspection tour of the walnut districts of France and Italy on August 1st. We will keep our trade fully posted as to conditions of these crops as fast as information is available.

Calgary, the convention city of the International Irrigation Congress this year, is the western gateway to the largest single irrigation system on the North American continent, and the second largest in the world. At the convention this year, October 5 to 9, delegates and visitors to Calgary will be given an opportunity to inspect this project as arrangements are being made for an excursion to Bassano during the week of the congress. This system occupied several years in building, and cost millions of money.

Eight-Hour Law

Farmers the State Over Are Awakening to the Fact That a Great Danger Confronts Them. Every Effort Should be Made Before November 3rd to Roll Up Overwhelming Vote Against This Initiative Measure

The Farmers' Union of Eastern Oregon, in resolutions unanimously passed regarding the proposed eight hour initiative bill, says:

"Initiative Measure No. 13 makes it unlawful for any employer to require or permit any employee, male or female, to labor more than eight hours during any day of 24 hours or more than 48 hours of any week of seven days, except that agricultural laborers may be permitted to work 10 hours a day where such work is necessarily incidental to farm management; provided, however, that in cases of extraordinary emergency endangering life or property, laborers may be permitted to work overtime, but shall receive therefor one and one-half times the rate of wage ordinarily allowed, for all time employed in excess of eight hours for each calendar day. This law applies to every person employed in the state. The penalty for violation is a fine of not less than $10 nor more than $100 for every day that such violation continues.

"In this state (Oregon), harvest wages are based upon long hours of labor and the wages paid are far above that which could be obtained by men of similar skill and ability in any other line of work.

"This is done because the harvest season is one of great risk to the farmer and unless the harvest is gathered at the proper time as quickly as possible, the farmer risks the loss of his crop, in whole or in part, through exposure to the destructive action of the elements.

"A single storm may wipe out his income for the entire year and involve his labor for two years. On account of the short season, it would be an impossibility to conduct harvest operations with a crew laboring only eight hours per day, without sustaining a great loss before the last of the crop is secured. It is a difficult matter to secure proper help at the best, and it would be an impossibility, owing to a lack of laborers, to work two shifts of men eight hours each, even if the farmers were able to pay the additional expense.

"If this measure becomes a law, it will add to the cost of farming to an extent that may wipe out the slender margin of profit which now exists between the cost of production and the selling price of the farmer's crop and so put the farmer out of business."

The Farmers' Union of Oregon seems to be awake to the danger which confronts the farming industry. Many Californians are awakening, and we believe this California eight hour measure will go down to defeat under an overwhelming adverse vote. However, the few months intervening between this and election time calls for a general campaign of education for, as was shown in last week's Cultivator, there are some even amongst the farmers who are so kindly disposed toward labor that they have not stopped to consider the real effect of this bill upon labor and upon the employer of labor. We believe the prevailing opinion is that labor must be fairly dealt with, but to encourage such a drastic measure as this will only cause contention between employer and employed.

"Permit."

We call attention especially to one word in this proposed law. "Any employer who shall require or permit, or who shall suffer or permit." In other words, a vicious employe who sees fit to injure his employer, and it seems there are such, if not prevented, may work overtime, which may lead to the arrest and fining of his employer, while under the terms of this bill no punishment whatever can be meted out to the one employed. He may work as many hours as he pleases and for as many people as he pleases during the 24 hours. We have asked a number of farmers for opinions on the effect of this measure, and some of these have been given in former Cultivators. A few more follow:

W. S. Guilford, Glenn County.

I believe that the passage and enforcement of the proposed eight hour law would work such a hardship on farmers who must employ labor that they will be forced to leave the state, or to enter other lines of business.

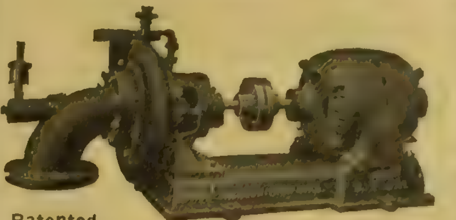
J. P. Dargitz, Sacramento County.

As to the eight hour law: As far as it bears on the general farming and fruit-growing operations it is an unthinkable thing. No one who has ever tried farming and fruit growing could think otherwise. When harvest time comes there is no eight hour system

(Continued on Page 43.)

Electric Driven Centrifugal Pumps

It is absolutely noiseless and has neither pistons, valves or gears to get out of order.



Patented.
Jackson "1912" Direct Connected Pump.

Every Byron Jackson Centrifugal Pump is designed to operate continuously under various conditions.

Only the highest grade of material and workmanship enter into its construction. Severe tests have proved that its high efficiency is sustained over long periods of service.

Electrically driven centrifugal pumps are used extensively for irrigation work.

We furnish these pumps for one horse power up.

Farm Telephones

There are about a million Kellogg compact type magneto farm line instruments in operation in this country today, which is convincing evidence of the splendid operation and reliability of this Kellogg product.

Fine quarter-sawed oak woodwork, handsomely finished; loud ringing, non-adjustable, non-sticking ringer; carefully adjusted transmitter arm that will not wear out and hang down loose after a few months time; powerful generator furnishing ample ringing current—rings over the heaviest loaded country lines; accurately designed receiver, steel re-inforced to prevent breakage as is also the transmitter mouthpiece; and lastly the world-famed Kellogg local and long distance transmitter which reproduces the voice with the greatest distinction. It is guaranteed free from inherent defects for five years. These are all features which make Kellogg farm line instruments ideal for rural operation.

We have excellent facilities for making prompt shipments of our goods. All instruments are assembled complete in our own factory in Chicago, which is the greatest railroad center in the country, assuring prompt transportation.

One reason we have grown so rapidly in our fifteen years of manufacturing is due to the fact that men in the operating field have had our liberal support in the investigating of methods for improving service. In turn we have gained their confidence and have benefited accordingly. Kellogg farm line instruments are known throughout the world for their long life.

Each new piece of apparatus which we offer from time to time has been designed with a mind to bettering service, rather than saddling "freak equipment" on a customer solely with the hope of reaping a few extra dollars.

Write for our prices. Send for our big bulletins 70—F on Magneto Telephones and 69—F on Magneto Switchboards. We will mail them promptly.

General Agriculture

CLIMATIC CONDITIONS AFFECTING DRY FARMING IN THE SOUTHWEST.

By R. H. Forbes, Director Arizona Agricultural Experiment Station, Before Dry Farming Congress at Tulsa, Oklahoma.

The distinctively semiarid, subtropical, southwestern field may be defined as the region which combines less than 20 inches annually of rainfall, more than 70 per cent of possible sunshine, sharp frosts (down to zero Fahrenheit) in winter, long periods of hot weather (average maximum of 90 degrees in July) in summer, and very low atmospheric humidity. This region of combined extreme conditions includes Southern Arizona, most of Southern California, and adjacent parts of Mexico.

The severity of the extremes encountered in portions of Arizona which are now being attempted by dry farming methods, may be indicated by rainfalls of 11 to 24 inches; relative humidities occasionally varying down to 10 per cent; average maximum temperatures during summer months of about 100 degrees; untimely killing frosts; and at higher altitudes severe and long continued winds. These conditions whose combined effects may be measured roughly by an annual evaporation from a free water surface of 50 to 90 inches, are designed to test to the utmost dry farming practice, as it has been elaborated in districts farther to the north and east.

Difficult as the problem is seen to be, encouragement is offered by the occasional successes of experimenting farmers, especially during years of timely rainfall; by the excellent results of the native Papago Indians with their acclimated crop plants; and by the marked successes of the French in North Africa in a region fully as difficult of conquest as our own Southwest.

The beginnings of our study of extreme arid agriculture have been made in Arizona at altitudes between 4000 and 5000 feet, with rainfalls of nine to 11 inches, the preliminary work having been conducted on the usual theories of moisture conservation by soil mulches; one and two-year rainfall accumulations; planting in proportion to available water, etc. As a result of the work done by Professor Clothier, more particularly in South Spring Valley, the cultural practices of other districts seem subject to modification, and a new list of crop plants peculiarly suited to the region has begun to appear.

With reference to the controlling factors of rainfall and evaporation, and the water residue which can be maintained between them, the rainfall of the region occurs mainly in two seasons,—the winter season of November to March, inclusive, and the summer season of July to October. The winter rains are usually quiet and slow and sink mainly into the soil; while the summer rains are torrential and lost by run-off after storms. The two rainy seasons, about equal in amount, are separated by the very dry months of April, May and June, the two latter of which also include many of the hottest days of the year. This hot, dry foresummer has proved to be a serious climatic problem in Southwestern dry farming, especially where at higher altitudes there is much wind.

During the winter season, with its slow rainfall, moderate temperatures, and slight wind movement, conditions are apparently favorable for water storage in the soil and conservation by cultivation in the usual manner. During the summer rainy season also, when occur the heaviest storms, the data obtained at McNeil in Sulphur Spring Valley, show considerable accumulations of water in the upper four feet of soil. The attempt to carry this stored supply over for use the following year, however, has always failed in all types of soils despite the maintenance of deep soil mulches; and crops on fallowed grounds have been no better than those grown with no attempt at water storage.

Field observations have shown that about April first, with the advent of the dry, hot foresummer, a crust, caused by the subsurface evaporation, begins to form, increasing in thickness until the advent of another rainy season. Under our conditions a three-inch mulch is ineffective; and a mulch as deep as it is practical to maintain with ordinary tools seems inadequate to prevent loss of soil moisture from one year until the next. Only in light soils, easily penetrated by the rainfall and underlaid by heavier soil at four feet depth or more does there seem to have been some accumulation of water.

This effect seems due not only to the extreme aridity of the region, but to the high daily variations in temperature of surface soils, often ranging from 60 to 125 degrees in the course of a single day. Moisture laden air may then be expanded out of the soil in the day time and replaced by the dry cool air at night, which in turn may carry away additional moisture. For such reasons, associated with the extreme climatic character of the region, dry farm soils at McNeil have afforded a suitable seed bed in May and June when certain crops should be planted in order to mature before frost in the fall.

Under the stress of this condition we have had recourse to the use of the supplemental irrigation water applied through furrows for the purpose of bringing up crops of Indian corn, beans, milo and sorghum. By the use in this manner of three to four acre-inches of supplemental water, the seed has been brought up and the root systems developed so that when the summer rains came the crops were ready to make immediate and heavy use of them. Evaporation during the following season has then been checked temporarily by interculture of the rapidly growing crops, the object of the whole process being to make use of the water supply quickly before it shall have been lost by evaporation.

This procedure is the same in principle as that of the Moqui Indians, who, when threatened by late rains, plant each grain of corn in a handful of adobe mud and bury the wet mass under six or eight inches of sandy soil. The wet seed sprouts in the lump of mud, pushes to the surface, encounters the late rains with a flying start, comes to rapid maturity and is safely harvested before frost.

Supplemental irrigation water has proved indispensable not only to start but also to save and mature crops at times when the fickle and uncertain rainfall has proved inadequate. In brief, the experience thus far gained in Arizona indicates that with our dry foresummer, and our uncertain rainfall, our summer crops should have an insurance or supplemental supply of pumped or stored water to be used sparingly in emergencies to start or save a crop. Storage may be effected not in reservoirs necessarily, but for a period of weeks or months before planting time in the soil itself. A small stream of pumped water may be turned through successive furrows in a field, and the furrows then cultivated shut, the moisture thus trapped remaining available for use in gradually diminishing amount thereafter. The owner of a small pumping plant therefore may secure an extended use of his plant by thus storing water against planting time in the soil itself.

Using a few acre-inches of supplemental water in this way, experimental crops of beans, corn, milo and sorghum have been grown that promise economic success for the summer season. Winter crops have not thus far given satisfactory results, wheat and barley, for instance, approaching maturity during the severe months of May and June. Professor Clothier, speaking on the basis of experimental data, states that the two acres of milo irrigated with four inches of supplemental water pumped from a depth of 180 feet, produced a crop at no greater cost and equal in value to six tons of alfalfa grown on one acre with four feet of water pumped from a depth of 30 feet. This statement, if it holds good in practice, means the development of considerable areas of southwestern territory wherever ground water is available within economic pumping distance of the surface.

Equally important with cultural methods is the choice of crop plants especially adapted to the region. Species and varieties of crop plants native to subtropical desert regions are usually well adapted to the Southwest. Among these are native varieties of Indian corn, beans and squashes; and olives, pomegranates, tamarisks, forages and grains of the sorghum class, millets, and other drouth-resistant plants from the Old World. Of especial interest among these are the quick-growing varieties of teparies or Indian beans native to the mountains of Sonora and Southern Arizona and grown by the Papagoes from ancient times. These interesting beans germinate quickly, grow rapidly if supplied with moisture or drop their leaves and become quiescent if rain falls; set seed in the hot dry foresummer season when ordinary beans do not fertilize, and finally mature a crop on less water and in less time than is required by introduced beans, even those like the common frijole, that have been grown in the region for many years. Among introductions from the Old World, olives, pomegranates and tamarisks are the most hardy, especially tamarisks which withstand our extreme conditions of drouth, heat and cold, and endure also high percentages of alkali.

Probably of greatest importance among crops thus far introduced are the sorghums, among them kafir and several varieties of milo. These crops come from desert North Africa, and fit easily into the summer crop season of the Southwest. Sorghum proper affords abundant forage; and milo and kafir, possibly also shallu, afford good crops of grain which in feeding practice are an excellent substitute for Indian corn.

Replying to the inevitable question, spineless cacti, so far as we now know them, are not of economic value in Arizona. They do not withstand the heat of lower altitudes without shelter and irrigation, and they do not endure the frosts at higher altitudes. To make satisfactory growth at intermediate altitudes they must be irrigated, and the land and water required to grow them can be used for other more profitable crops.

The utilization of southwestern crops grown at great distances from large markets is equally important with culture methods and crop plants. Necessarily the main outlet for dry-farmed forages and grains is through animals and their products. Beef, dairy products, wool and mutton, pork and poultry are all the logical result of dry-farming operations supplemented by insurance irrigation on one hand and by the remaining grazing ranges on the other. The silo will undoubtedly be found essential for providing succulent feed here as elsewhere when green forage is not available. This will be found especially necessary for dairying which is one of the most likely developments of the region.

In review: The outlines of the semi-arid, southwestern agriculture as they begin to appear at this time are: Conservation for the earliest possible use for crops of rainfall by dry-farming methods of culture; the use of supplemental stored or pumped irrigation water; the hardiest and most drouth-resistant crop plants; silos to conserve forage supplies; livestock to convert crops grown into marketable produce.

The farmer himself, however, is more important than any of these, for the system is complex, requiring good knowledge of the methods of planting, knowledge of the properties of soil, intelligent choice and use of tools, skill with machinery, and expertness in the management of animals. Such combinations are not usual, and the development of every educational facility is called for to prepare and fortify men for the reclamation of the region.

In time, and after much hardship and many failures, I believe that considerable areas of southwestern semiarid lands will be intelligently and successfully cultivated.

SERVED BY THE GAS ENGINE.

The prevention of waste of effort, like other items of economic waste, is one of the chief arguments in favor of the gasoline engine on the farm. The days of unremitting drudgery have been abolished wherever the spirit of modern progress has made itself manifest. The ingenuity of the human mind has found as many ways for the profitable use of the gas engine as in any other branch of American industry.

The gas engine on the farm has an apparent versatile form of gender. It is by turns called the "hired girl" and the "hired man," the "chore boy," the "mail carrier," the "washer lady," the "butter maker," and a score of other titles. For the gasoline engine is ubiquitous in its abilities. Mounted upon a wheeled truck or portable base it works indoors and out, above ground and below.

It saves the farmer's wife, his daughter, his son and himself much hard labor, and a close inspection of its record and usefulness will probably also determine that not once, but upon several occasions, it has saved the farm itself.

It took a Kipling to sing "a song o' steam," but the explosive or muffled bark of the gas engine on thousands of American farmsteads is its own press agent and is faithfully chorused by jubilant owners and an admiring farm press.

Possibly it is in the guise of "chore boy" that the gas engine, or gasoline, kerosene or distillate engine is most valuable to the farm because in this guise it is an all-purpose help. It operates the pump that fills the stock tanks, turns the separator, washing machine, wringer, dynamo for the home electric light plant, the feed grinder, ensilage cutter, cider press, the wood saw and the binder in harvest time.

The light weight all-purpose engine of this class can be directly connected with the harvesting machinery and thus do all the work except pull the machine.

With the horses to pull the binder, the engine can be worked in soft ground, thus saving an extra team in harvest time on each binder and likewise saving the strength of the team. This light weight engine is automatic and governed by the throttle.

Weight, formerly deemed necessary in stationary engines, is no longer desirable. The improvements made in marine type, automobile and aeroplane engines proved that extreme power with lightness of weight were as successful as they were necessary to the purpose desired.

The light weight farm engine has proved serviceable in scores of tasks and neither size nor weight are longer necessary to prove durability.

The throttle-controlled, float-feed carbureter type of light engine gives both regulation and economy of operation, and these are essential traits to the all-purpose engine on the farm. Every farmer realizes the need of this character of engine on his farm and the one to four or six horsepower plant will economically perform a host of chore tasks for him far more quickly and in a better way than by the muscle-straining manual effort.

With the engine mounted on various types of harvesting machines it is possible to work such machines with more efficiency and greater results. It may be attached to a corn binder, driving a short shaft which operates the mechanism of the binder independently of the horses that pull the machine and thus takes the extra drag and tractive force from the wheels.

Such engines will take the place of horse flesh in many ways. They may be attached to the mowing machine to drive the sickle bar at a greater speed to get better cutting results in heavy grasses in certain fields or districts where ground is rough or rolling.—St. Jo. Fruit Grower.

THE CROOKED AND STRAIGHT

In any decent code of business ethics there can be no place for sharp practices. Not many years ago considerable homage of a contemptible sort was paid to the man who could "get the best of the bargain" through some piece of cheap trickery. Even today, among the less respectable element of men in business, the merchant who takes mean advantage of his customer and creditor and "gets away with it," as the base phrase runs, is looked upon as a "smart man" and one deserving of all success.

The player incapable of playing square should be put out of the game or kicked out, according to his degree of resistance. This is as true of clean business as it is of clean sportsmanship.

Of course, it is easy to work up fine feelings of indignation at the things in business of which we disapprove. After all, there is not much to be done about it except do the best we know how and make the path as rough as possible for the crook, as long as he remains a crook.

It is a good thing to be honest. It is a big thing to be successful. It is a great thing to be both honest and successful—Implement Trade Journal.

ATTENDANCE AT LOS ANGELES COUNTY HORTICULTURAL PICNIC.

"Believe me, that was some picnic," is the description given by P. D. Barnhart. The picnic referred to was that held by the Los Angeles County Horticultural Society at the grounds of Howard and Smith, at Montebello, on June 28th. The day was partly given over to pleasure, in fact, but little business was transacted, but a good program, touching to a certain extent upon things of interest to nurserymen was rendered. Not the least pleasing portion of it was a number of vocal solos. Those who attended were met at the end of the street car lines by a fleet of motor trucks.

The guests of honor were members of the Pasadena Horticultural Society and many others, friends of the Los Angeles County Society. Over 300 sat at the banquet table at one time. Practically everything good to eat and drink was served.

THE INITIATIVE IN CALIFORNIA

Written for the California Cultivator

By E. L. Payne.

The state constitution of the state of California provides that upon presentation to the secretary of state of a petition certified, as provided, to have been signed by qualified electors equal in number to eight per cent of all the votes cast for all candidates for governor at the next preceding general election at which a governor was elected, proposing a law set forth in full in said petition, the secretary of state shall submit the said proposed law to the electors at the next succeeding general election occuring subsequent to 90 days after the presentation aforesaid of said petition. All such initiative petitions shall have printed across the top thereof, in twelve point black face type, the following: "Initiative measure to be submitted directly to the electors".

Any law submitted to the people by initiative and approved by a majority of the votes cast thereon at any election shall take effect five days after the date of the official declaration of the vote by the secretary of state. No law initiated or adopted by the people shall be subject to the veto power of the governor, and no law adopted by the people under the initiative provision of the constitution shall be amended or repealed except by a vote of the electors, unless otherwise provided in said initiative measure.

Any initiative petition may be presented in sections, but each section shall contain a full and correct copy of the title and text of the proposed measure. Each signer shall add to his signature, his residence, giving the street and number, if such exist; his election precinct shall also appear on the paper after his name. The number of signatures attached to each section shall be at the pleasure of the person soliciting signatures to the same. Any qualified elector of the state shall be competent to solicit said signatures within the county or city and county of which he is an elector. Each section of the petition shall bear the name of the county or city and county in which it is circulated, and only qualified electors of such county or city and county shall be competent to sign such petitions. Each section shall have attached thereto the affidavit of the person soliciting signatures to the same, stating his own qualifications and that all of the signatures to the attached section were made in his presence, and that to the best of his knowledge and belief each signature to the section is the genuine signature of the person whose name it purports to be, and no other affidavit thereto shall be required.

Each section of the petition shall be filed with the clerk or registrar of voters of the county or city and county in which it was circulated, but all said sections circulated in any county or city and county shall be filed at the same time. Within 20 days after the filing of such petition in his office, the clerk or registrar of voters shall determine from the records of registration what number of qualified electors have signed the same; and upon completion of such examination shall forthwith attach to said petition, except the signature thereto appended, his certificate properly dated showing the result of said examination, and shall forthwith transmit said petition, together with his said certificate to the secretary of state, and also file a copy of said certificate in his office. Within 40 days from the transmission of the petition and the certificate by the clerk or registrar to the secretary of state, a supplemental petition identical with the original as to the body of the petition, but containing supplemental names, may be filed with the clerk or registrar of voters as aforesaid. The clerk or registrar shall within ten days after the filing of such supplemental petition, make like examination thereof, as of the original petition and upon completion of the examination, shall add his certificate properly dated, showing the result of the examination and forthwith transmit a copy of the supplemental petition, except the signatures, together with his certificate, to the secretary of state.

When the secretary of state shall have received from one or more county clerks or registrar of voters a petition certified as herein provided, to have been signed by the requisite number of qualified electors, he shall forthwith transmit to the county clerk or registrar of voters of every county or city and county in the state his certificate showing such fact.

A petition shall be deemed to be filed with the secretary of state upon the date of the receipt by him of a certificate or certificates showing said petition to be signed by the requisitte number of electors of the state.

All measures submitted to a vote of the electors under the above provisions shall be printed and together with arguments for and against each such measure by the proponents and opponents thereof, shall be mailed to each elector in the same manner as now provided by law as to amendments to the constitution proposed by the legislature, and the persons to prepare and present such arguments shall be selected by the presiding officer of the senate.

PURPOSE OF FARM COST ACCOUNTING

By J. S. Ball Department of Farm Economics, U. S. D. A.

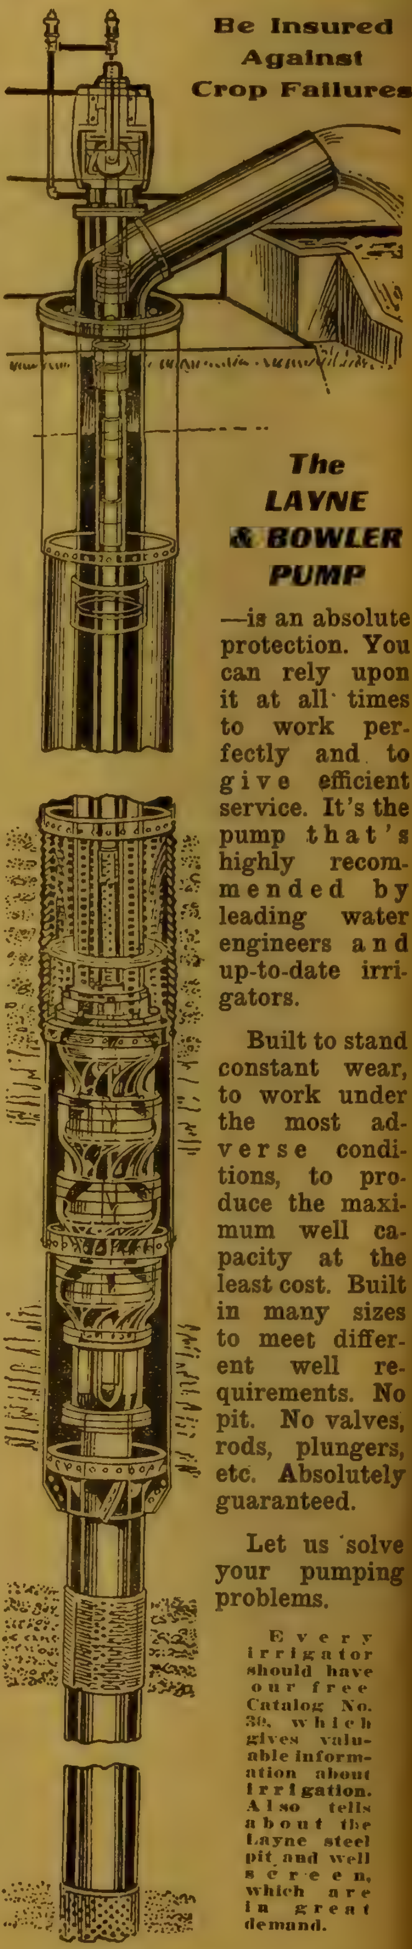
Discussion of the value and use of complete cost records on the farm is becoming quite frequent in the rural press, and rather divergent views of this subject are being expressed. The real purpose of keeping cost records is to determine the cost, income and profit of each individual enterprise in which the farmer is engaged; to set forth the governing factors of these; to exhibit the efficiency in the management and use of man labor, horse labor and farm machinery; to show what the cost of living amounts to; and to fit these and all other branches of the farm industry into a complete, comprehensive whole that shall show every detail of the farm organization and operation.

Cost accounting methods that fulfill all requirements in commercial enterprises will not necessarily do for the farmer. While the farm is a business and factory combined, it has one element not found in any other line of business, for the farm is a home and the home finances are so involved in those of the farm that it is necessary to use care and thought to avoid confusing the farmer's personal business as a man with the farmer's business as a farmer. A man may make a profit in his farming operations and still be falling backward steadily by reason of his high personal and living expenses; or he may not even be making 2 per cent on his investment and yet be getting ahead. He may do this by keeping down these personal expenses, or a small per cent net return on a large capital may more than cover his living expenses. By means of complete farm cost records these conditions can be shown in their true light and the farmer enabled to discover the weak spots in his business organization.

Keeping account with only one or two enterprises may not show true conditions. In such accounts all possible income items are usually remembered, but many items of expense which complete accounts show actually exist are rarely added to the costs. As Prof. Warren of the New York State College of Agriculture has said: "It is easy to figure a profit on anything except on the farm as a whole," and an attempt to bring the profit figured on a few separate special enterprise accounts into harmony with the year's gain or loss on the whole farm will usually fail for lack of complete data.

In all cases, actual farm values should consistently be used and the actual facts ascertained. If the values or quantities are made too high

An Adequate and Dependable Water Supply is Essential FOR SUCCESSFUL FARMING



Be Insured Against Crop Failures

The LAYNE & BOWLER PUMP

—is an absolute protection. You can rely upon it at all times to work perfectly and to give efficient service. It's the pump that's highly recommended by leading water engineers and up-to-date irrigators.

Built to stand constant wear, to work under the most adverse conditions, to produce the maximum well capacity at the least cost. Built in many sizes to meet different well requirements. No pit. No valves, rods, plungers, etc. Absolutely guaranteed.

Let us solve your pumping problems.

Every irrigator should have our free Catalog No. 30, which gives valuable information about irrigation. Also tells about the Layne steel pit and well screen, which are in great demand.

Layne & Bowler Corp.

LOS ANGELES, CAL.**

in the second inventory in order to swell the year's "book" profits, the next year's "boo.. profits are affected inversely in like amounts. If the crop yields are overestimated or overvalued to make the crops show up well; if they are underestimated and undervalued when fed to show livestock profits; if manure is credited to the livestock and never charged to the crops; or if any such juggling of accounts is indulged in by any man he is only fooling himself, and he gets distorted and misleading results. Showing every enterprise as it is, with conservatism in placing values, is the only safe road to true results.

Another pitfall in farm cost accounting is the tendency, almost universal, to single out one farm enterprise—as, for instance, beef cattle—as the sole productive account of the farm and to charge all produce to this account at cost. Accounting of this kind is labor thrown away. The results will not give the farmer any information as to how to improve his methods so as to receive greater profits.

The keeping of farm cost accounts requires thought and painstaking attention in their recording, summarizing and interpretation, but are well worth it all to the farmer who wishes a true analysis of his business. What is the use of going to a lot of trouble to keep accounts that do not give any true insight into actual conditions? Beef is a finished product; so also are corn, oats, hay and many other things produced on the farm. The production of each of these is a separate, distinct farm enterprise, and the farmer needs to know the relative profit or loss from each separate from the others. Then farm cost accounting becomes a valuable means to an end—more profitable business management.

THE TYPEWRITER IN THE HOME.

Much has been written in regard to the typewriter in the home, its value and usefulness, and much more can be written as the months pass by, for each moon brings new evidence of the possibilities and advisability of the writing machine for the home, especially on the farm and more especially on the ranch in California. Up-to-date methods in farming and ranching in this state are employed. A successful rancher on a large scale or small scale is deriving not only a living, but enjoyment out of his work. He is not by any means a faddist, but a clever, thinking, clear-minded business man; whose value as an important addition to his neighborhood is evinced by the manner in which he conducts his ranch. Observers take notice that the successful rancher of today is in touch with the world, and is well posted on the leading questions of the day. With the R. F. D. at his command he can, without visiting the large cities, keep in touch with his fellow men. It is safe to say that no invention—not even the indispensible telephone—brings as much real enjoyment, satisfaction and profit as the typewriter, for with it, no matter what the conditions are, early or late, tired or rested, callers or no callers, manicured, or hands with the true rancher's grip, calloused or not, the rancher enjoys the use of the typewriter in his correspondence, and keeping records of crops, etc., for the typewriter will record his thoughts with accuracy and neatness, whereas the task with a pen would be laborious. In no other way can a man, semi-isolated or out in the desert communicate with his friends and keep his mind active and get real enjoyment from his work as with the typewriter. No business is conducted now without it. No business man cares to receive a letter written in long hand, no matter how well it may be written. The times demand it.

The cost of a good typewriter is very small, compared with the service it will give. Even the used machine is better than none. The cost of a new machine is not much greater than of a secondhand—they can be bought on favorable terms from the leading companies. Many farmers and especially small ranchers are beginning to realize the value of the typewriter for the use of the children. Every boy and girl should know how to use a typewriter. It teaches them to spell correctly, punctuate, collect their thoughts and to be neat in their work, and best of all, the knowledge of a typewriter may be a big help to them in their future vocation, and is often a stepping stone to a successful career.

The manager of one of the leading typewriter companies in Los Angeles advised the editor of this paper recently that his company could not obtain sufficient young men and women to fill the calls for positions in offices where the typewriter is used. The public schools recognize its usefulness as a study and the operation of same is part of the regular course. We predict within a few years the typewriter will be as well known and perhaps more widely used in the home than musical instruments, in fact, it should be part of the rancher's library and office.

FARM CREDIT AT WASHINGTON

Farm credit legislation seems to be headed toward a sharp contest between those for and opposed to government loans. The new Bulkley-Hollis bill introduced in the house is the result of the deliberations of the joint sub-committee of two branches of congress. It contains in part, the principle of government loans for the benefit of agriculture, which the large farm organizations have contended for. In this respect, together with the killing of the Moss-Fletcher bill, the new bill can be taken as a partial triumph for the farmers. These organizations were practically united in support of the bill introduced by Representative Bathrick of Ohio, who has led the fight for government aid during the last two years. His persistent propaganda for this principle is well known, and to his research, speeches and writings is mainly due the credit for the general understanding of that division of the farm credit question.

In an interview he presents his views as follows: "Everybody now knows that all the leading nations of Europe are doing more for the farmers than I have asked our government to do. Those who are posted, and are not more interested in high profits on interest than in the future of our food supply, have stopped calling government loans class legislation and socialism.

"My bll is still the best bill to relieve the burden of high cost of money to the farmer. But I have had some experience in getting the right kind of legislation. Very often the overzealous miss the psychological moment to get the best they can. It is for that reason I have announced my support of the Bulkley-Hollis bill. The bill contains three items of substantial government aid which will be of immense advantages to the west and south, particularly. It opens possibilities of good everywhere. It contains as little greed as could be expected with the many opinions of conflicting interests. It has a touch of mutuality and improving amendments can be made which should not seriously conflict with the opinions of the makers of the bill. Expenses of operation are low, the bonds to be issued against mortgages are well fortified and should sell at a rate which should reduce the interest burden to the borrowers."

FACTORS OF PROFITABLENESS IN FARMING

Low real estate prices.

Farm products of classes deficient in supply.

Magnitude of the farm business, measured either by land farmed or amount of labor required.

High quality in products.

Reputation of the producer: Applies especially to the production of pure-bred breeding stock.

Advantageous marketing.

Productiveness of animals kept.

Largest yield with relatively little labor and fertilizer.

Low cost of production. (Involves good farm organization.)

Stability of profit depends on the staple character of the products.

A PLACE FOR SMALL TOOLS

If you have a shabby suit case that you have discarded for a better one, it may "make good" again as a toolbox—to hold all small tools about the house. It keeps all of them dry—in one snug place, and it is handy to find a tool when in a hurry.

Opportunity knocks now and then for the most people, but it seldom bursts down the door.

WESTERN UNION
NIGHT LETTER
THEO N VAIL PRESIDENT
107
RECEIVED AT 133 NORTH 5TH STREET EL CENTRO CAL
17 GS DY 110 NL 6 EX
MILFORD UTAH JUNE 14 1914
CURTIS HOPGOOD
MAIN ST AND IMPERIAL AVE EL CENTRO CALIF.
PROJECT FULLY AS GOOD AS REPRESENTED. WE HAVE FOUND EXTRA GOOD LAND.
EQUAL BEST SOIL IMPERIAL VALLEY. APPLE PEAR AND CHERRY TREES LOADED
WITH FRUIT ALFALFA AS GOOD AS WE HAVE EVER SEEN. POTATOES FOUR TO
SIX HUNDRED BUSHELS PER ACRE. WHEAT FIFTY BUSHELS. OATS WEIGHING AS
HIGH AS 60 POUNDS PER BUSHEL. YIELDING SEVENTY FIVE TO NINETY BUSHELS
IRRIGATION SYSTEM PERMANENTLY BUILT. WHOLE PROPOSITION SOUND AND
MARKETS GOOD. OUR OPINION IS THAT THIS LAND NOW SELLING AT $30 PER
ACRE WILL BE WORTH TWO HUNDRED WHEN IN ALFALFA. ADVISE YOU COMING
AT ONCE AND LOOK IT OVER.
EL. RALSTON, JOHN BARON, L.M.VANHORN, W.P.DOWNEY

-what successful Imperial Valley ranchers say about

Milford Valley Lands at $30 per acre

A FEW days ago a group of Imperial Valley ranchers pictured above visited the lands of the newly opened Milford Valley irrigation project. They are men who took advantage of the opportunities that existed in Imperial Valley several years ago. **They made money.** A few weeks ago they heard about Milford Valley of Southern Utah. They went up and made a thorough investigation, as only **practical men** can do. The Western Union Night Letter reproduced above was sent by them to Curtis Hopgood, an Imperial Valley rancher, who was unable to make a trip to the valley, but requested them to wire him immediately if conditions were absolutely as represented.

On Main Line of Salt Lake Railroad—adjoining Live Town of Milford.

These men bought generously of the rich, red, loamy lands of beautiful Milford Valley. They knew that this $30 land (with a perpetual water right at $70 per share, payable in 12 years, if desired) would be easily worth $250 or more an acre when in alfalfa. They appreciated the value of a water maintenance cost that should not exceed 30 cents per acre per annum. They reveled in the glorious mountain air of the valley—elevation 4971 feet. They enthused over the **pure, soft,** sparkling drinking water. They realized that this was a **successful man's land.** They knew that land sold on a cash basis would eliminate the homesteader class of settlers. They bought within sight of Milford, a progressive city—an important railroad center. They were alive to the crop possibilities—in alfalfa, potatoes, grain, dairying, hog raising and deciduous fruit culture. They saw another **Imperial Valley opportunity** in Southern Utah. That they bought land right on the spot is a wonderful tribute, a splendid testimonial to Milford. Imperial Valley men surely **know good land!**

This land opportunity is going fast. If you buy now you gain an overwhelming advantage over the late comers—by buying suburban to the city of Milford. Write today for illustrated booklet which tells about the best valley in the west—about land that is being sold at only a fraction of its real value. Write today!

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

CONTENTS THIS WEEK

CAPAY VALLEY, Cover.
TABLE GRAPE SHIPPERS ARE SENSIBLE, 27.
CITRUS AND TROPICAL FRUITS.—Nematode Worm on Roots of Citrus Trees; Fumigation of Olives; Avocados in San Diego County, 28, 29.
DECIDUOUS FRUIT CULTURE.—The Walnut Situation, 30.
EIGHT HOUR LAW, 31.
GENERAL AGRICULTURE.—Climatic Conditions in the Southwest, 32.
FARM ECONOMICS.—The Initiative in California; Purpose of Farm Cost Accounting; The Typewriter in the Home; Farm Credit at Washington, 34, 35.
EDITORIAL, 36.
NEWS NOTES, 37.
LIVE STOCK AND DAIRY.—Feeding Cotton Seed Meal to Hogs; Milk Per Acre; Starting in the Sheep Business; How to Kill Flies; Holstein-Friesian Annual, 38, 39.
PROFIT IN THE POULTRY YARD.—Raising Runner Ducklings; Roup, 40, 41.
QUESTIONS AND ANSWERS, 42, 43.
GRAVENSTEIN SHOW, 43.
SEEDLESS LEMONS, 43.
HOUSEHOLD, 44, 45.
MARKETS, 46, 47.
VETERINARY, 47.

CHINESE EGGS.

It is claimed that Chinese eggs are laid down in San Francisco at less than ten cents per dozen, and that the production cost in China is less than six cents. If the importation of these eggs is continued it is hard to see where the Pacific Coast egg producer will land; either he will have to go out of the business or live like a Chinaman.

DRY FARMING.

The coming Dry Farming Congress will be held in Wichita, Kansas, October 7-17. In connection with it will be held the International Soil Products Exposition. The list of premiums for dry farmed products aggregates $3500. In addition to these cash prizes there will be many offered by various implement and tractor manufacturers which will vastly increase the premiums.

Consolidation

California Cultivator Absorbs the Rural Californian and Now Leads All Weekly Coast Farm Papers in Circulation

In 1877 the old-time Southern California Horticultural Society, realizing the need of an organ, fathered and mothered for nearly three years the Southern California Horticulturist. On January 1, 1880, it passed into private ownership, and Messrs. Carter and Rice began the publication of Semi-Tropic California and Southern California Horticulturist. In November of 1882 Mr. Rice, with Mr. Martin as business manager, launched the Rural Californian, and the next issue announced the purchase of the Semi-Tropic California.

From that time until the present the Rural Californian has been published as a monthly, and it is one of the oldest magazines dealing with rural life on the Pacific Coast. A few years ago it was purchased by the Cultivator Publishing Co., and has since been issued by practically the same force as engage in the production of the California Cultivator. The business manager has decided that greater usefulness may be secured by merging these two papers and giving to advertisers the benefit of the greater combined circulation, which now aggregates nearly 25,000 papers every week, and to subscribers the benefit of the centering of our energies in the one paper.

The June issue of the Rural Californian is the last one of that magazine to appear. Rural Californian subscribers will have their subscriptions continued for the unexpired term. Those who were subscribers to both papers will have their time extended.

All the features which have been helpful in the California Cultivator will, of course, be continued. In addition, some which have proven so popular with subscribers of the Rural Californian will be taken up, and, as soon as arrangements can be completed, the household and other departments will carry on some of these favorite features; for instance, in the household department, announcement will later be made of contests for recipes, menus, etc., and we hope to give in one issue of each month a page to prize photographs of home life on the Pacific Coast. More definite announcement will be made in later issues.

REGISTER

It seems that every voter in California should be registered before this, but we learn that there are thousands yet to register. There are questions at issue at this coming election in which every producer should have vital interest. In order to vote at the primaries or have the name of any value on a petition at this time, one should register. The primaries are in August, and there are yet a few weeks in which to register, but soon these few weeks will pass, and the primaries, which are more important than the final election, may be deprived of the support of some of our best people.

DOLLAR WHEAT

The Society of Equity, with headquarters at Indianapolis, is making a strenuous effort to encourage farmers to hold for dollar wheat. The visible supply is lower than for several years, and while the coming crop will be large, the shortage of holdover, combined with the shortage in all European markets, should encourage the farmer to be at least a bit independent. The definite suggestion is made that farmers market slowly at the start, selling only as compelled unless an entirely satisfactory price is offered. The society is not urging farmers to become members or to combine in demanding a specified price, but it does urge them to hold and not be stampeded into selling at disastrously low prices.

STANDARDIZE.

We call attention to the action of the grape growers of the San Joaquin Valley. Their industry has been seriously injured by unscrupulous shippers who have considered only their own selfish interests and have marketed fruit unfit for human food. They have received long prices for their "early grapes," but their low quality has caused the trade to rebel at the imposition, and then the shipper who had been honest and held back his grape crop until it was fully ripened has put his product on the market just in time to receive the punishment which should have gone to the "early" shipper. This the scrupulous shipper is getting tired of and he is demanding in no uncertain tone that the practice shall cease. Many of the shippers are signing the standardization agreement of the newly formed California Green Fruit Association, and it is to be hoped that all will do so before the grape shipping season is on. The organization so far does not cover the Tokay section of the north. It is to be hoped that the Tokay people will perfect a similar one or affiliate with the San Joaquin Valley association.

SOME COTTON.

The July report of the crop reporting board of the United States department of agriculture summarizes the condition of the cotton crop as follows: "The area of cotton in cultivation this year (1914) in the United States is about 39,960,000 acres, as compared with 37,458,000 acres, the revised estimate of acreage in cultivation a year ago, being a decrease of 498,000 acres, or 1.3 per cent."

The condition the country over was 79.6 per cent of normal. This was better than last year the same date by five per cent, but slightly under the ten-year average.

The best feature of the report from the California standpoint is that where many other states are showing an area under that of last year, California shows a planting of 35,000 acres as against 14,000 last year, or 250 per cent of last year's acreage. The greatest increase in any other state is in Missouri, the acreage there being 110 per cent as compared with the preceding year. Oklahoma shows the greatest decrease. Her area is 92 per cent of last year's, while Texas, the greatest cotton growing state of all, shows 95 per cent of last year's planting. Her acreage this year aggregates 12,052,000. Georgia comes in second with 5,000,000 acres; Alabama and Mississippi next with about 4,000,000 and 3,000,000 respectively.

The total acreage of cotton in the United States is 36,960,000. Condition at the end of June the country over was 79.6, while that of California alone was fully 100 per cent. California's little 35,000 acres does not loom up very big compared with Texas' 12,000,000, but quality and condition of crop and all considered, we are some producers of cotton.

Agricultural News Notes

Italian tomato paste and extract have of recent years become well established in the world market.

The demand for grapefruit is steadily growing in England, but it has not yet come into general consumption, being handled only by the highest class of fruit dealers.

Citrus culture has developed remarkably in the past few years on the Isle of Pines, south of Cuba. Americans now own practically all the agricultural lands of the island.

Early this year an entire shipload of sugar-beet pulp was shipped from Almeria to Boston and New Orleans to be used for feeding cattle. The cargo consisted of 1089 tons and was packed in sacks containing each 88 pounds.

By a recent decision of the department of agriculture all fruit juices to which alcohol has been added must be plainly labeled to show this, if they are to be shipped in interstate commerce after Sept. 1, 1914. In the past alcohol has been frequently added as a preservative to preparations which are used for such purposes as flavoring beverages or preparing cordials.

Two crops of oranges a year mature in central India. The trees flower from February to March and the fruit is ripe from November to December or January. The second flowering is from June to July, and the fruit ripens from March to April. The oranges of the second crop are the sweetest and, coming at the beginning of the hot season, are highly valued.

Two new cooperative creameries will soon commence operating in Saskatchewan, Canada. These will be under direct control of the Saskatchewan department of agriculture, just as are all similar establishments in this province. As the government pays express charges upon all cream supplied to a cooperative creamery, no matter how long the haul, distance from market does not affect the farmer.

In its control of hog cholera, Canada has for years adopted a quarantine of infected farms and districts, and infected and contact hogs are slaughtered, thorough disinfection under government inspection is required, and no hogs are allowed on the premises for three months. Owners are paid compensation to the extent of two-thirds of the appraised value, which shall not exceed $15 for grade hogs or $50 for pure-breds.

One of the most remarkable instances of nature providing for the wants of man is in the vegetable sponges of Ecuador. The vine on which the sponge grows is found on the flat wet lands of this republic, appearing only during the rainy seasons. It is an annual and grows rapidly, after the fashion of a pumpkin vine, with long smooth fruit resembling a summer squash. Upon ripening the fruit is gathered and dried, when the interior is seen to be composed of a tangled network of fine fibers, with black seeds similar to those of the watermelon. The dried skin is easily removed, when the fibrous network or sponge is ready for use, after one side has been cut open. Washing in a few waters removes all extraneous materials, and the sponge may be used as any other. The poor people utilize them for washing dishes and when bathing, claiming they are superior to the animal sponge.

Agricultural News Notes of the Pacific Coast

Northern California

A "dry" federation is being organized in Napa County.

Buyers in Alameda County are offering $35 a ton for apricots.

It has been decided to hold the Sebastopol Gravenstein Apple Show August 3-8.

A big combined harvester in Yolo County has been posing before the movie camera.

So far this season apricot shipments have been almost three times as great as last year.

A big hog ranch is to be established near Winters. A tract of 1400 acres will be devoted exclusively to raising hogs.

Almond growers of Durham, Butte County, have decided to incorporate a growers' association and erect a warehouse.

Supervisors of Placer and Nevada Counties have been conferring on a proposition to build a road around Lake Tahoe.

Horticultural Commissioner Lamiman of Shasta County estimates the prune crop this season at about 40 per cent of average.

Alfalfa growers of Oroville expect to cut between eight and ten tons to the acre this season. They are now cutting their second crop.

Oakdale, Stanislaus County, is shipping prunes and onions in carload lots. They are being handled by the California Fruit Growers' Association.

At the call of the Yolo County board of trade a meeting was held in Woodland June 30th to form an organization to fight the eight-hour bill.

The Sonoma County Poultrymen's Federation is discussing the question of calling a state convention to agitate legislation against the Chinese egg.

The rate-making departments of the steamship companies are making up schedules of prices for carrying California fruits through the Panama Canal.

An experimental planting of tobacco at Oroville has proven very satisfactory and it is stated that 150 acres additional will be planted next spring.

One of the newest initiatives calls for a bond issue of $1,800,000 for permanent buildings for the University of California. The petition was started by the alumni association of he university.

Last June the payment to dairymen of Oakdale, Stanislaus County, for cream checks was $900. This year t is $10,000. New herds of dairy ows are being brought into the dis-rict almost daily.

Vineyardists of San Joaquin County ave taken advantage of the warm weather to sulphur their vines. The nusually heavy foliage on the vines as kept them moist and damp and made several sulphurings necessary.

The Sacramento Valley Development Association has appointed a ommittee of 15 to present to the people of the Sacramento Valley campaign plans adopted by the association. The purpose of the campaign is induce exposition visitors during 915 to actually visit the Sacramento alley and learn of its possibilities st hand.

Central California

Dinuba is now shipping out melons by the carload.

Modesto's free market is open on Tuesdays and Thursdays.

Selma, Fresno County, has inaugurated a free city market.

The latest estimate of the raisin tonnage for 1914 is 100,000 tons.

Two warehouses in Corcoran, Kings County, are receiving 6000 sacks of grain a day.

Dinuba's first carload of watermelons for this season was sent to Seattle, June 26th.

It is now thought that the Porterville cannery will make a run on tomatoes this fall.

Alpaugh beet growers have signed contracts for a term of five years on an acreage of 2500.

The Tulare County Growers' Association has signed a contract for 10 cars of Tuscan cling peaches.

Officers of Porterville, Tulare County, canneries are asking for a new train over the Southern Pacific.

The bulk of the apricot crop in the Kerman district will be sold to the California Cured Fruit Exchange.

The State Viticultural Commission held a meeting for growers of the third district in San Francisco June 30th.

Kerman, Fresno County, reports practically all apricots cut by the last of June. Many sales have been made at nine cents.

At the recent meeting of the San Jose Grange, Patrons of Husbandry, the matter of securing a county advisor was discussed.

The manager of the Tulare cannery expects to start work on peaches by the middle of the month. The first to be handled will be Tuscans.

A big cattle feeding project is to be established in the Poplar district of Tulare County, July 15th. It will start off with 1000 head of steers.

An emergency potato convention will be held in Stockton August 11 and 12 for the purpose of improving shipments of California potatoes and guarding against quarantine by other states.

The Western Meat Company of San Francisco has entered the cattle business in Tulare County. The company will bring cattle from San Francisco to fatten on the big hay crop of the Tulare section.

The California Holstein Friesian Association met in Corcoran, Kings County, June 17th and listened to a number of addresses. It was decided to hold the next meeting in San Francisco in June, 1915.

There is a movement now on to form a Merced irrigation district which will include over 200,000 acres. It is proposed to leave out the Atwater district, where there has been considerable opposition shown.

A break in the Davis reservoir of the Turlock irrigation district caused extensive damage last week. It is feared that two crops of alfalfa will be lost because it will be impossible to repair the dam for this summer's irrigation.

Southern California

San Diego County claims the garlic king of the world.

Hog breeders near Calexico are organizing to fight hog cholera.

Southern California's lima bean acreage is estimated at 125,000.

Ventura County reports no trouble in securing plenty of apricot pitters.

Southern California estimates its output of potatoes at 18,000,000 sacks.

San Diego County citrus and olive growing sections report black scale worse than for years.

There have been some slumps in the melon trade, but as a rule growers are pleased at returns.

The Limoneira ranch at Santa Paula, Ventura County, shipped 21 cars of lemons in one week.

The Walnut Men's Protective League is being organized to watch the larger interests of the walnut industry.

Santa Ana County's forestry nursery is well started. Many of the trees will be ready for planting out next spring.

The Orange County sealer of weights and measures has brought to book Japanese berry growers who were marketing light packages.

Imperial Valley is hoping to press to completion the organization of the irrigation district to secure control of the Colorado river and its irrigation supplies.

The Walnut Protective League has declared against the eight-hour law, the minimum wage scale and the threatened advance in freight rates on walnuts.

Machinery and equipment for the packing house of the Hemet Cured Fruit Association is being installed. It is to be ready by July 10th for work on apricots.

A number of apricot growers outside of the regular association in Orange County are reported as trying to get together to form a marketing association.

Manager Griswold of the Covina Fruit Exchange has just returned from a visit to citrus markets in Eastern United States and Canada. He reports prospects for Valencias very bright.

The total acreage of sugar beets planted this year is estimated by the Southern Pacific and by the California Beet Growers' Association at 65,400 acres, slightly less than previous years' acreages.

San Bernardino invites the world to celebrate the completion of the Pacific Electric line from Los Angeles to that city on Saturday, July 11th. The entire town will keep open house for the visitors and a great good time is promised.

An initiative petition is being circulated by the "People's Fish and Game Commission" calling for many changes in the game laws, two of which are: "No license fee shall be charged citizens of the state to fish with rod and line, when not for profit"; "citizens of the state may hunt in counties in which they reside, when not for profit, without payment of license fees."

The Coast

Kiesling, Washington, expects to more than double its last year's output of apples.

Eight hundred thousand sheep are owned by the Navajo Indians of Northern Arizona.

The New Mexico college of agriculture at Mesilla Park held a silo demonstration on June 23rd.

The crop of watermelons in the country about Phoenix, Arizona, is this year estimated at 250 cars.

Members of the Farmers' Union of Maricopa County, Arizona, have incorporated a marketing company.

Over 1000 Mexican cattle have been purchased by the government for Indians on the San Carlos reservation in Arizona.

Only 25 cars of prunes will be shipped this year from Clark County, Washington, according to a recent estimate.

The mid-summer fair of Maricopa County, Arizona, will be held at Phoenix, July 10, 11. Many cash prizes will be awarded.

The Central Idaho-Washington Fruit Growers' Association held its annual meeting the latter part of June, reelecting all officers.

Bankers of Douglas, Arizona, estimate the amount of money realized from cattle sold there within the past few days at over $150,000.

The University of Arizona has organized an agricultural extension service. The work will be carried on by traveling field agents and lecturers.

Farmers of Umatilla County, Washington, have contracted wheat for July delivery at 71 cents. The crop is estimated at 90 per cent of normal.

A large number of cattle have been shipped to Wyoming from Arizona ranges this season. Mild winters and cheap hay are said to make steer feeding profitable.

Salt River Valley of Arizona reports a slight shortage of water. Farmers are hoping for flood waters from the summer rains and early fall rains in the valley.

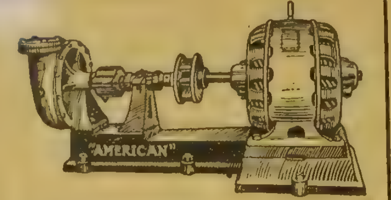
Timber land owned by the University of Arizona within the Coconino and Tusayan national forests is now being logged conservatively under regular forest service rules.

The first apples for 1914 were shipped from Kennewick, Washington, a week ago. Packed in small peach boxes, the apples realized 75 cents to $1 per box, which is a record price.

Farmers of the Waterville district in Washington are cooperating with County Agriculturist Richardson in hog feeding experiments to test the relative values of alfalfa and sweet clover.

About 2000 head of cattle, mostly from California, will be pastured on the river bottoms below Parker, Arizona, this summer. The prospects for pasture in the river bottoms are better than for several years.

Luna, Grant and Dona Ana counties of New Mexico have shipped out 19,600 head of cattle the present season. The average price is said to have been $30. The range in this section is said to be in excellent condition.



More Water—Less Power

That's not merely a claim we make for the

American Pump

but a fact which is proving true in case after case where this splendid pump is in use. It's not the result of chance, but of a score of vital reasons. Get our American Pump catalog. It tells the whole story and gives you pump facts it will pay you to know.
By making more pumps, factory costs are cut, consumer benefits.

Los Angeles, Cal.

A Forage Plant That Will Yield More Than Alfalfa

And unlike alfalfa, this new forage plant will thrive in arid and semi-arid regions without irrigation; yielding about four times the food value in forage per acre as alfalfa. We refer to the Luther Burbank pedigreed Spineless Cactus, which has rightly been termed the "miracle plant."

A farm has been established near Riverside, California, for growing Cactus Slabs of the Luther Burbank pedigreed varieties for planting. These slabs are sold in large or small quantities. A request to the El Campo Investment & Land Company, 211 Story Building, Los Angeles, will bring you free an instructive Folder on Cactus Culture.

Live Stock and Dairy

FEEDING COTTONSEED MEAL TO HOGS

By Dr. Andrew M. Soule, President Georgia A. & M. College.

This is a subject of general interest to southern farmers, for cottonseed meal is an indirect by-product on practically every farm. That this question constitutes an issue of more than passing importance is shown by the large number of inquiries received concerning the utilization of meal as an amendment in rations for hogs. A long series of experiments have been made to determine what could be done along this line and recommended with safety to the farmer. In most instances an adverse result has been obtained. It has seemed that cottonseed meal could only be fed for a limited period to hogs without producing fatal results. Much variation in this respect has been shown in all experiments made, due no doubt to some inherent characteristics of the animals under test. Apparently a small percentage of the hogs fed on this concentrate are immune to any toxic effect it may be thought to exert when fed to this class of stock.

Naturally the meal could not be fed under the conditions portrayed above with either satisfaction or success. Work was therefore begun some years ago in Texas to determine in what proportion it could be used advantageously, especially in combination with corn. It was soon discovered that if the meal and corn were fermented together in the proper proportion of five parts of corn to one of meal, that hogs could be fed this mixture for from 50 to 90 days with excellent results and a large measure of safety. In fact, there seemed to be little danger from using this combination for 60 days and where the animals were allowed to range on fresh pastures, for as long as 90 days. The quantity of meal which could be used under these conditions was, however, limited though its effects were shown in the larger and more uniform gains made, the finer quality of the pork as to the admixture of fat and lean and the large percentage of good meat in proportion to the offal. It was necessary to ferment the feed for at least 24 to 36 hours in summer and from 48 to 72 hours in winter. This, of course, involved considerable trouble to the farmer, but was a wise policy nevertheless, for the results obtained seemed to fully justify the use of the small amount of meal indicated as an amendment to a ration of corn for hogs. These particular tests were conducted in Texas. Since that date some important work has been undertaken in North Carolina with results that promise to be of the greatest importance to the hog raising industry of the south.

To Prof. W. A. Withers much credit is due for the persistency and success with which he has investigated the toxic of cotton seed meal on hogs and the discovery of a means by which it could be utilized with safety in a ration for this class of animals. The experiments cited were originally carried on for quite an extended period of time with guinea pigs and rabbits. Iron salts were used to overcome the toxic effect which cotton seed meal is supposed to produce in certain classes of animals after the expiration of a given period of time. It was found that when the iron salts was used the life of both guinea pigs and rabbits could apparently be prolonged for an indefinite period of time and cotton seed meal be made one of the principal constituents of the ration. When the iron salts was withheld, both guinea pigs and rabbits died in a comparatively short period of time. The success attained led the investigators to try their results on hogs. Twelve pigs were selected for this purpose, weighing about 50 pounds apiece. They were placed in two separate lots. The daily ration consisted of one-half pound of cotton seed meal and one and a half pounds of corn meal. One lot of hogs received a solution of the iron salts while the ration was increased in volume as the animals grew. Green feed was witheld and the animals were not allowed any exercise save that obtained in the small pen in which they were confined. These conditions were instituted in order to increase the severity of the test. At the end of 12 weeks four of the pigs fed cotton seed meal and corn meal without salts were dead. The other two had only made a gain of 35 pounds apiece. The six pigs which received the iron salts made an average gain of 54 pounds, or more than one and a half times as much as those fed on the first ration mentioned. These results indicate therefore that certain salts of iron have the power to mitigate any toxic effect which may be attributed to the use of cotton seed meal in a ration for hogs.

Every one realizes that corn in itself is not a desirable feed for hogs. First of all, it does not contain enough mineral or muscle-making material. The gains from the corn alone are therefore costly and rather slow. The high price of corn renders its use as the sole concentrate for the finishing of hogs almost prohibitive in the South. Some material containing protein of a relatively cheap and desirable form must be added to a ration of corn to secure the best results. Cotton seed meal would naturally be the food stuff selected for this purpose and now it would appear that a method has been discovered by which it can be used with apparent safety. Farmers should not conclude from these results that it can be fed without discretion, care and good judgement, and the method advised must be tested out on a larger scale before definite conclusions can be drawn; but every one should look into this question and satisfy himself concerning its practicability.

To this end he should secure some copperas and dissolve one pound of it in 50 gallons of water, or in other words, a barrel of water. For each pound of cotton seed meal fed take one gallon of the above solution and mix thoroughly with the grain ration which may constitute for a 100 pound hog as much as one pound of cotton seed meal and four or five pounds of corn or corn meal. If the hog weighs only 50 pounds do not feed over half a pound of cotton seed meal and use only half a gallon of the copperas solution. For still smaller animals feed in the same relative proportion.

The wise farmer will test out this new method carefully and on a small scale until he is satisfied that the deductions made by Prof. Withers are correct. It is believed that he will secure satisfactory results from these tests and it is needless to point out the advantages which will come to him if cotton seed meal can be made a definite part of the ration for hogs in the South and fed with safety through the addition of a small quantity of a solution of copperas to the daily ration.

* * *

The above article which appears in The Oil Miller was referred by its editor to R. E. Montgomery, chairman of the publicity committee of the Oklahoma Cotton Seed Crushing Association, and he takes issue with Mr. Soule as to there being a toxic effect in cotton seed meal fed to hogs. He says:

"In the first place, I am going to deny that there is any toxic effect on hogs from eating cotton seed meal, for the reasons that none of the experiments made and reported from the different experiment stations have proven anything of the kind to me. Above all, the chemists have been looking for this poison in cotton seed meal for the past 16 years, and up to this time I have not seen where they have made the discovery. On the other hand, from my experience and from the experience of a large number of friends in the practical feeding of cotton seed meal to hogs, it has been clearly proven to me that there is no toxic effect on a hog caused from the eating of cotton seed meal."

It is possible Mr. Montgomery is

correct in the above opinion, but we would suggest that hog feeders experiment carefully before taking this opinion over that of Mr. Soule. Cotton seed meal is a fine feed, and if its use may be extended amongst our poultry people a greatly increased output will be made for one of California's large productions.

MILK PER ACRE

How much milk per acre does the dairy farm in California produce? We imagine but few of our dairymen have figured it out on this basis, but it would be interesting to know whether California land is producing up to the limit. We venture it is above the average. This question has been investigated by the Dominion department of agriculture, or by the branch of it at Ottawa, and from its deductions we quote:

"If it may be assumed that the farm of the average factory patron is fairly well adapted to dairying, that the patron himself is inclined towards dairying, rather than, let us say, fruit growing, and that his cows are fairly good, then it will be of interest to note how the farm is made to respond to this dairy inclination.

"There are frequently noticed yields as low as 250 pounds of milk per acre cultivated including pasture, but some good patrons obtain 750 and 800 pounds per acre. Even this is little enough, for there are plenty of authentic records of 1100 and 2100 pounds of milk per acre. It should not be extremely difficult to obtain more than this, even 2500 or 3000 pounds.

This latter figure is a long, long way ahead of the yields already mentioned of only 250 pounds which may be found on many a so-called dairy farm in Canada, and is indicative of the possibilities in reach of the factory patron, who is really anxious to attain first rank.

"It is questionable if the average yield per acre in Ontario is much more than 600 pounds of milk. If loyal, whole-hearted support is given to the local factory and to our national industry of dairying, the farm and the dairy herd will be made far more productive. Great help will be derived by keeping individual records of each cow, because the old-established, complacent "average" cow has no intention whatever of assisting the average patron to get 3000 pounds of milk from the average acre. The first necessary step is to know for certain that each cow is a good producer, then one may aim with more hope at $30 or $40 per acre."

STARTING IN THE SHEEP BUSINESS.

The following questions have recently been answered by Prof. F. W. Wilson, animal husbandman of the Arizona agricultural experiment station at Tucson:

Question. It is my intention to contract for 4,500 aged ewes, mutton type, bred to Tunis bucks if possible, if not, to some other mutton breed, bucks put with ewes June 1st, to be herded on the best mountain ranges and delivered with reasonable cutback October 20th.

Answer. I will say to this plan that it would be rather difficult to purchase ewes mated to Tunis rams and possibly even to rams of some of the best mutton breeds. You would probably have much better luck if the ewes were mated about the middle of June rather than along the first of June.

Question. These ewes I will try and procure from the Flagstaff country and understand they are priced at $3.75, same class of stuff bringing a quarter less last season.

Answer. It strikes me that $3.75 is about as reasonable a price as you could expect, perhaps just a little bit cheaper than good first class stuff can be bought at this time.

Question. I had figured on lambing 1,500 ewes from each of three camps, doubling up ewes and lambs from the three camps according to ages, making bands about 1,000 ewes and their lambs, dry ewes and ewes that have lost lambs and no other lamb adopted to be disposed of as soon as lambing period is over.

Answer. Your plan of cutting your bands up into 1,500 ewes is all right, but I would cut them down to smaller bands; 250 ewes in a band is about all that can be handled successfully from time to time, in fact I believe it is the maximum we should try to handle on alfalfa land, and if viewed from the standpoint of ownership of the land it is highly desirable that there be not over 250 ewes in a band. From the standpoint of best gains possible and best possible care of the ewes it is desirable that they be put in bands of from 200 to 250. If this is not practicable of course you can manage the sheep as I shall indicate later.

Question. What percentage of lambs can I reasonably figure on under the above conditions?

Answer. Generally from 100 to 125 per cent.

Question. What per cent of bucks would you advise to insure the highest possible number of lambs?

Answer. Two to three per cent.

Question. Should bucks be left in the bands over two months?

Answer. No; 65 days is sufficient.

Question. Should ewes be on lambing grounds a few days before the lambs begin to come?

Answer. Yes, if possible.

Question. Where 1,500 ewes are lambed from one camp by careful men, not crowded, no dogs about, can it be managed to advantage?

Answer. Yes, if the band is drifted a short distance away each day, allowing the young lambs born the night before to remain on the bedding ground, and as the lambs grow a little older gradually drifting them back into a larger band. I will refer you to Bulletin 69, "The Improved Types of Sheep for the Southwest," in which you will find a chapter on the methods of lambing as generally practiced by sheep men in this state.

Question. What breed bucks other than Tunis would you recommend for the above?

Answer. Hampshire and Shropshire.

Question. What are they worth?

Answer. Usually from $10 to $15 each, possibly a little less. We sold our grades last year for $8 or $9 a head.

HOW TO KILL THE FLIES THAT GET INSIDE.

If by any mischance flies enter the house, the next thing is to kill them. Any home-made trap to catch them so they can be drowned or burned will answer, or sticky paper may be used, then burned.

The doors and windows may be closed and twenty drops of carbolic acid sprinkled on a pan of live coals. The vapor will kill them. Pyrethrum powder may be sprinkled on a shovel of live coals and carried about the room, then the flies swept up and burned.

For poison, use two tablespoons of formaldehyde to half pint of water. Place in plates or saucers, sweetened slightly to attract the flies; or use poison fly paper, as directed. One must exercise care when using poison that children do not get it, or the dead flies drop into food. It is a good plan to place poison on the porch or near the door where flies enter to kill them before they get into the house. A shelf may be attached to the door casing to hold the poison, bringing it near where the flies congregate on the screen and out of the way of children or pets.

HOLSTEIN-FRIESIAN ANNUAL

At the recent annual meeting of the Holstein-Friesian Association of America, held in Chicago, annual reports were made and officers elected for the coming year. In the attendance we note that California had only one representative at the meeting, Mr. J. W. McAllister. The secretary reported many additions to the membership at this meeting, and at the end of the meeting the total accessions during the year were reported to be 1079, with a total present membership of 6,600.

Some idea of the magnitude of the association may be had from the fact that its bill for postage during the preceding year was approximately $5,000.

The president reported that the total reserve fund, with its accretions of interest, is now the immense sum of $151,368.30.

True courage, as well as true wisdom, is not distrustful of itself.

DE LAVAL
CREAM SEPARATORS
save much time and labor in summer

BESIDES GREATLY INCREASING the quantity and improving the quality of cream and butter De Laval Cream Separators save much valuable time and labor.

THIS GREAT SAVING OF time and labor counts for more in summer than at any other season and often alone saves the cost of a separator, aside from all its other advantages.

AS COMPARED WITH ANY kind of gravity setting the saving of man's time and labor and usually woman's drudgery with a De Laval is a big item in its favor.

AS COMPARED WITH OTHER Separators the De Laval saves much time and labor by its greater capacity, easier running, easier handling, easier cleaning and freedom from need of adjustment or repair.

THESE ARE MERELY SOME of the advantages which make a De Laval Cream Separator the best of all summer farm investments, as every De Laval agent will be glad to explain and demonstrate to any one at all interested.

SEE THE NEAREST De Laval agent at ONCE or if you do not know him write us direct for any desired information.

Free Service For Caterpillar Owners

ALL Caterpillar Tractors are backed by Caterpillar service. We keep a corps of trained tractioneers constantly in the field, moving by automobile from one Caterpillar owner to another. If you buy a Caterpillar this expert service is given to you free.

CATERPILLAR
Reg. U.S. Pat. Off.

Our expert makes you familiar with the construction and operation of the Caterpillar. He assists you with any minor repairs. He tells you how "Smith," over on another ranch, is using his tractor in a way which you might adopt to advantage. And he comes again a few weeks later. He keeps in touch with you constantly and makes you one of the great family of Caterpillar users. In rush seasons, when delays are costly, this service is of particular value to you. Parts are always on hand ready for emergency delivery.

The Caterpillar has proved a practical, all-round tractor to thousands of ranchers in California. It is because of the ☛Caterpillar track. With its big bearing surface it gets a sure grip on the ground—no power is wasted. It prevents soil packing. Get our catalog B 56 and find out more about the Caterpillar. Why not write today?

Profit in the Poultry Yard

RAISING RUNNER DUCKLINGS.

Written for the California Cultivator
By Jean A. Koethen.

There is nothing quite so cunning and captivating among young poultry, not even excepting the downy baby chick, as a flock of Runner ducklings two or three weeks old. They hold themselves so erect; their carriage is so "racy"; they run so fast and forage so energetically, it is no wonder they lure many a feminine heart simply by their cuteness, and irrespective of their commercial qualities. The Pekin duckling is funny and lovable at first, but it soon gets fat and soggy, and is always panic-stricken if you approach. Runners are less timid and keep their cuteness till they are grown. I have never seen a breeder of Runner ducks that was not enthusiastic over them, and they are coming into favor very rapidly indeed.

The raising of young ducklings is a very much simpler matter than the raising of chickens and turkeys, and methods are practically the same, whether you have Runners or some other variety. A duckling is a duckling, and while the Runner may be a little less hardy than the Pekin, any difference in the handling will be in quantity or quality of care, and not in principle.

Raising ducklings really looks at first sight like a lazy man's job. In the first place, there is no question of keeping them free from vermin, though I have heard that occasionlly ducks that are neglected will be troubled a little. No spraying or disinfecting of coops is needed, no dusting or greasing. All this labor is eliminated outright if you have ducklings. In the second place, they require less warmth in their infancy. To be sure, many hatch with hens and then let the hens brood their foster progeny for a couple of weeks, but just as many take them from the hens at once and keep them in fireless brooders. My Pekin ducklings this spring were put in a fireless brooder, which was nothing but a small box covered with an old wool sweater and a burlap sack. Clean litter was put in each night, and when the nights were chilly we put the ducklings to bed at five o'clock or thereabouts. They were out on the ground all day and never seemed cold. Had I known then how careful some people are to keep them warm at first I should have fussed over them all the time, as I do over brooder chicks, but where ignorance is bliss it is just as well to be ignorant. The ducklings seemed comforable and they certainly grew like little pigs. Perhaps Runners need a little more warmth. I should certainly watch them, keep them in a protected place, and use hot water if it seemed necessary.

In the third place ducklings are far less susceptible to disease than chickens or turkeys. They are not subject to diseases of the respiratory organs, like swell head, roup and bronchitis. Their only vulnerable point seems to be the digestive organs, hence all precautions for preserving their health must be directed to care of the digestion. In the fourth place ducklings are not as easily injured by filth as chickens. This is not to say that they can be left indefinitely in dirty quarters, or that they do not require clean, dry bedding and coops, but only that they will not suffer as much or die as soon from such neglect as chickens would. This certainly ought to be a great recommendation to the lazy poultry person. However, no very lazy person will raise any kind of poultry long. That is pretty plain to the dullest observer.

The trouble with raising ducks is, you can't set a pan of mash before them, throw a handful of grain once or twice a day, and let them raise themselves. Ducklings have to have moist mash three, and at first five times a day, and mixing this, rain or shine for several weeks, is a bit arduous. It is a joy to watch them grow, though, and the Runners repay one with a full egg basket at an age when even Leghorn pullets are in the nursery. In fact, the Runner duck is called "the Leghorn of the duck family", probably because it is really more profitable and more easily raised than a Leghorn.

My friend, Mrs. J. J. Harrison of Eagle Rock has been very successful in raising Indian Runner ducklings, and she has given me this account of her method for the benefit of Cultivator readers:

The ducklings are usually hatched with Plymouth Rock hens, but this spring, sitting hens being scarce, several clutches of eggs were hatched by ducks which became broody. They proved to be excellent sitters, too, but of course it would have been too much to expect them to mother the babies.

After two days of quiet in the nest, —for all the duckling needs at first is warmth and rest,—they were put in a wooden coop with what Mrs. Harrison calls a "jug-mother," namely a jug of hot water wrapped in flannel and set in the corner of the coop, which is so partitioned off that at first the ducklings cannot get far from the "mother". When the ducklings were let out in the middle of the day the jug stood outside where they could run to it if they felt chilly. As the cool of the evening came on the "mother" was refilled and replaced in the coop where the ducklings could nestle about it and yet be free to go in and out as they chose until night, when they were shut in. Ducklings do not like the confinement of the fireless brooder box. I discovered that with my Pekins. They never would go in themselves. We had to put them in every night, and no matter how carefully they were covered they were nearly always out in the morning.

The "jug-mother" seems on this account a better foster mother than the fireless brooder. The one objection to it is that the water will get cool by morning no matter how carefully the jug is wrapped! I do not know how Mrs. Harrison managed about this. I have myself gotten out of bed before daylight of a cold spring morning to warm up the "mother", when I had a brood of chicks I felt particularly fussy about, but one would hardly do that for ducklings.

Feeding Runner Ducklings.

The first two days after they are hatched Mrs. Harrison's ducklings get nothing but water and grit. The water is in a chick fountain, for at this tender age a wetting might be fatal. Runner ducklings are particularly sensitive to dampness, and care must be taken to keep bedding, ground and bodies dry.

The third day a little bran is mixed with grit and charcoal and moistened with warm water so that it is just crumbly. The ducklings will not eat much at first, but there is no harm in leaving the dish before them. Unlike turkeys, they will not eat till they are ready, nor more than they need. This mash of bran and charcoal and grit is fed five times a day the first ten days, and always with each meal comes the fountain of clean water. I gave my Pekins warm water to drink the first ten days because I had read that cold water might cause cramps, but Mrs. Harrison does not think this necessary. The water she gives them, however, is not very cold.

Mrs. Harrison has found that there is a little tendency to looseness of the bowels when this moist mash is fed. When this appears, a hard boiled egg is mixed in the mash. This always has a constipating effect.

Some time during the second week the mid-forenoon meal is replaced by a meal of cut clover or alfalfa, and soon the afternoon meal is replaced in the same way. This reduces the number of meals to three, with green between meals.

About the tenth day a little corn

meal and a handful of bread crumbs are added to the mash, and this ration is continued till the ducklings are three weeks old.

No beef scrap is used till the ducklings are three weeks old, because Mrs. Harrison is afraid of its effect on the bowels. At this time a teaspoon is added to the mash once a day, and this is gradually increased. If there is any looseness of the bowels the moist mash is now discontinued, and the mash given dry with water to wash it down, for a duck cannot eat dry food unless it has wate. to moisten it with.

At six weeks of age the ducklings receive the following ration: Bran—1½ pints, Cracked corn—1½ pints, beef scrap—¼ pint (in the morning only).

Charcoal and grit are always added to the mash, and the ducklings get green feed once or twice a day betweeen meals.

Animal Food Necessary.

Mrs. Harrison's method differs in three respects from that followed by most duck breeders: (1) The green feed is given separately instead of being incorporated in the mash. (2) Bran is used exclusively for the ration where most breeders add corn meal or corn meal and middlings. (3) Beef scrap is used more sparingly than most persons think necessary to produce the best results.

Whether there is any special advantage in mixing the green feed with the mash I do not know, but I think it would give bulk to the ration and prevent the bran from packing in the gizzard. Bran is apt to be too laxative, and this tendency is overcome by mixing corn meal and middlings with it. On the other hand the bran alone is a cheaper ration, and the ducks fed on it certainly grow and thrive. The addition of beef scrap and cracked corn after three weeks gives the balance which is needed, but there seems little to fear from using more beef scrap.

My own experience has been with Pekins, but I found them able to digest a much richer ration than Mrs. Harrison's. The first two days they were given bread and milk. This was changed after these two days to a moist mash of bran, corn meal and bread crumbs. At the end of the first week a little beef scrap was added, and by the end of the third week they were on the Cornell mash of equal parts of bran, corn meal, middlings and beef scrap, with grit and cut alfalfa always added. I never measured the alfalfa, but aimed to make it about one third of the whole. Perhaps this would be a little too rich and forcing for Runners, but one could easily tell by watching the bowels whether they were getting too much beef scrap. I think such ration is less likely to cause looseness of the bowels than bran alone. My Pekins had no charcoal, and not always grit, but they have never been "off their feed" a minute, and weighed three pounds before they were six weeks old.

Feeding any kind of poultry is a matter of principles rather than particulars, but there are a few things one must remember whatever ration is used: Feed bread and milk or something equally simple the first two days. Add beef scrap gradually after the first week, and watch its effect on the bowels. Give fresh water with every meal, and keep water always before them after a week or ten days. Moist mash and cracked corn should be the only grain feed of ducklings. Green feed should never be omitted for a single day. Lack of it leads to digestive disorders. Grit or sand should always be part of the mash.

Until the ducklings are three weeks old water should be given for drinking purposes only. After this they may have a large pan or pail or tub in which they can bathe, but the water must be changed three times a day. Ducks can get along quite well without bathing, but they must have a dish large enough to dip their heads in, or their eyes will get sore.

Shade Very Important.

Shade is as necessary for ducklings as a proper ration. They are sometimes sun struck in summer when this is neglected. Nothing is quite so good for shade as a spreading tree, but if this cannot be had frames covered with burlap should be provided. For some reason ducklings suffer even more than chickens from the direct rays of the sun.

Clean litter for the bed and clean ground to run on are also necessary. Ducks can get along without sanitary surroundings for a good while, but the piper is to pay sooner or later, and they grow faster if they are comfortable.

Indian Runner ducklings usually begin to lay at four or five months of age and keep it up right through the year, with perhaps two months out for the molt. Their eggs bring from two to five cents a dozen more than hens' in the Los Angeles maket, and it is not exceptional for a flock of good strain to average 180 eggs per duck. It looks as if Mrs. Biddy would have to watch out, since the Indian Runner is on the job. It comes to laying naturity earlier, lays more eggs on cheaper fare and the eggs bring a higher price. What more can any one ask?

ROUP

Roup is somewhat like la grippe in human beings, according to what a physician once said when he was called to treat an afflicted family. The whole house was sick. All had the same malady, and each one showed different symptoms. To use his own expression, "La grippe is very accommodating. If you don't want it one way you can have it another."

Where there is a hard swelling, open and remove the discharge. Disinfect the wound, and if not too bad, the individuals may get well. We have saved turkeys, which seem to be subject to this particular form of roup more than chickens, by this method. The fowls should be isolated, and under no condition be used for breeders. If they are there will be a flock of chickens constitutionally weak, and there will be more complaint of roup next year.

There is a pretty good opportunity to apply the golden rule to this case in regard to selling them as soon as they take it. Would you or we like to eat chickens that have had a disease indefinitely? Because there was no outward sign in particular until a few days before they died is no good reason that they were fit for food.

Take those fowls promptly from the roosts and move to isolated quarters. Examine, kill and burn the ones that are in the worst shape. Clean the house, spray with a strong disinfectant and burn all litter.

If you wish to treat the more mild cases cleanse the mouth with a wash made of one tablespoonful creolin added to four fluid ounces of water. In the case of a very thick membrane having formed touch the spot with straight creolin on a swab, being very careful to not get any of the drug into the windpipe or your bird is a dead one. The membrane can then be removed without bleeding.

Only in the case of very valuable fowls is it advisable to give treatment to the flock as a whole. The more birds you cure that are afflicted with genuine roup the more future trouble you will have with roup.—Wisconsin Farmer.

HE BARQUED

Willie was struggling through the story in his reading lesson. "No, said the captain," he read, "it was not a sloop; it was a larger vessel. By the rig I judged her to be a-a-a-a-a—"

The word was new to him.

"Barque," supplied the teacher.

Still Willie hesitated.

"Barque!" repeated the teacher, this time sharply.

Willie looked as though he had not heard aright. Then, with an apprehensive glance around the class, he shouted:

"Bow-wow!"

Good advice may help a man, but a good scare is often more effective.

Fuel Bills Cut Squarely in Two
When you use the

Muncie Oil Engine

The only engine from 20 to 100 H. P. successfully operated today in California on California fuel oil.
It's a wonderful engine—simple yet perfect—has no carburetors, battery, coil, magneto, gears or cams. It has only two essential attachments, the governor and the fuel pump.

FISH
MEAT MEAL
FOR POULTRY
We guarantee:--
1 —Better egg results than from any brand of "beef scraps."
2 —Positively no fish flavor in eggs or meat of birds fed on it.
3 —None of the digestive troubles that many "beef scraps" cause.
4 —Lower mortality among hens fed to force a high egg production.
5 —Baby chicks thrive on it; they don't die, as they often do on beef scraps.

What Does a Silo Cost?

AN IDEAL GREEN FEED SILO will pay for itself the first year. That being the case, it will cost you nothing.

AS A MATTER OF FACT, THE COST of a silo is really a secondary consideration, because if you are keeping dairy cows or raising stock for the market, there is no investment which you can make which will pay you better returns than an **Ideal Green Feed Silo.**

A GOOD SILO IS A NECESSARY PART of the dairy equipment of every cow owner or stock raiser who wants to realize a reasonable profit from his herd, and if the matter of cost has been standing in your way, please remember that it is really not a question of whether you can afford to erect a silo, but whether you can afford to do without one.

IF YOU HAVE NO SILO, A LITTLE investigation will be sure to convince you that you ought to purchase one right away.

THE SHREWDEST AND BEST POSTED ranchers in Pacific Coast States are buying **Ideal Green Feed Silos.**

Write for new Silo Folder A for full information.

COTTONSEED MEAL

is the most economical feed on the market today. All farm animals thrive on it. The best butter producer known. For chickens it has no equal—it makes hens lay. As a feed for horses and mules it is a proven muscle builder. Excellent for fattening hogs.

Read the following letter from the Cudahy Packing Company:

Messrs. Willits, Patterson & Green, June 18, 1914.
343 So. Hill St., Los Angeles, Cal.

Gentlemen;—

In response to your inquiry as to the desirability of Cotton seed Meal as a food for cattle, we beg to advise that we killed a large number of cattle last winter and during the early spring months that were fed on cottonseed meal. The quality of the beef proved quite satisfactory and the percentage of yield compared to live weight was very good. We believe it to possess very valuable qualities for the fattening of live stock.

Very truly yours,
THE CUDAHY PACKING CO., R. Scott, Manager.

Send for interesting FREE BOOKLET—it tells "how and why" to feed COTTONSEED MEAL.

COTTONSEED MEAL can be found at most feed dealers.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pest of Citron Blossoms

We have received from a subscriber at Petch Tikwah, near Jaffa, Palestine, package containing blossoms of citrus medica, the citron of commerce, and the subscriber says they are infested with Pray's citri. The blossoms were submitted to an entomologist, but owing to their dried and broken condition nothing could be determined. There appears to have been an infestation of some eating insect, in fact, there is an indication that the larvae of some insects have infested the interior of the blossoms, but as to what it is or the method of handling we are unable to tell. The subscriber writes that Dr. Silvestri of Italy has suggested the use of a one per cent solution of arsenate of lead. While it seems that a one per cent solution is rather weak, if sprayed upon the blossoms of the citron it might be as strong as could be used. But worst of all, the subscriber writes that this treatment did no good. Perhaps it was not timed right. We would continue to follow Dr. Silvestri's suggestion, for he is one of our greater economic entomological authorities.

Alfalfa Tea

A subscriber has written in regard to an article at one time published by a gentleman by the name of Dr. Suddith, giving method of steeping or preparing alfalfa for hog food. We are unable to find in a fairly complete bibliography on alfalfa any reference to any such article. However, we referred the matter to Prof. Woll of our state university and he replies that there did appear an article on this method of feeding, he thinks, in the Saturday Evening Post of about two years ago, written in the usual style of that paper. It referred to feeding hogs on alfalfa tea in place of skim milk. Professor Woll says he did not see the article, but thinks the statement was made that the alfalfa left after the making of the tea was richer in digestible protein than ordinary alfalfa hay.

Black Scale

I enclose apricot twig with something on it which I think is scale. What is it?—Subscriber, Hayward.

The twig is infested with a healthy looking bunch of black scale. Spraying with distillate emulsion or any of the better contact washes will control the pest.

Soil for Mushrooms.

In making beds for planting spawn for mushrooms will it be possible to use commercial fertilizers in place of horse manure, which is usually recommended? Perhaps this would be more expensive than the manure, but the latter is hard to obtain.—Subscriber Los Angeles.

We do not think this would prove successful, unless the soil chosen were naturally extremely rich in humus. It is not a question of the fertility in the horse manure so much as the physical condition which the growth of the spores requires. Especially is the matter of temperature a factor and this can be secured only by the use of a substance having the character of horse manure, and that must be especially well supplied with coarse, strawy material. The method of handling this material is to pile and after wetting slightly permit to heat and then to lose part of its heat until the temperature shall be reduced to 100 to 115 degrees. Then it is to be packed firmly in beds and the temperature reduced to 90 or 100 degrees and the spore carrying material inserted. In fact there is practically no soil or loam used in this excepting that some prefer a surfacing of one to two inches of good rich loam on top. Would suggest that the inquirer write to the United States Department of Agriculture, Washington, D. C., and ask for the Farmers' Bulletin 53, How to Grow Mushrooms, also Farmers' Bulletin 204, Cultivation of Mushrooms.

Curing Tobacco.

Please give method of curing tobacco.—Subscriber, Lindsay.

From an address given by Mr. Hearst of the Dinuba Chamber of Commerce we take the following regarding curing of Turkish tobacco. Of course there are other methods of handling other kinds: "The leaves of the Turkish tobacco are strung on strings about three feet long and hung in the hot sun for a week or more, or until it has attained a rich, golden color, when it is taken down and hung in the curing shed until the rainy season, at which time it becomes pliant or "in case," as it is called, making it in proper condition to be bulked, when the sweating process begins, and at which time it is ready for the market." In addition, if our subscriber is interested, would suggest he write the U. S. Department of Agriculture and ask for Bulletin 138 of the Bureau of Plant Industry, Production of Cigar Wrapper Tobacco, also Bulletin 143, Principles and Practical Methods of Curing, also Bulletin 268, Tobacco Marketing. The agricultural experiment station of Kentucky at Lexington has also issued Bulletin 139, Tobacco Cultivation, Curing and Marketing.

Alfalfa in Orchard.

I have a 40-acre orchard, mostly in peaches seven or eight years old. The trees are 20 feet apart. I would like to raise a 10-foot strip of alfalfa between rows. I have been told that it would cause black knot.—Subscriber, Sanger.

The growing of alfalfa will not cause root knot but the application of the amount of water required by alfalfa might possibly create soil conditions which would encourage its growth. The nodules or small excrescences growing on the roots of alfalfa have no relation to the disease known as root knot.

Government Lands.

Is there any government land in Oregon that will soon be open to settlement? If so, in what part of Oregon? —Subscriber, Madera.

Without question there is government land still available in Oregon. As to whether this is desirable and near transportation facilities we are not informed and only inspection or the employing of a qualified locator would determine that. While the land office usually gives out practically no imformation regarding lands would suggest that the inquirer write land offices in Oregon, of which there are seven. They may be addressed at Burns, LaGrande, Lakeview, Portland, Roseburg, The Dalles and Vale.

Drying Figs.

Where can I get information about drying figs?—Subscriber, Anaheim.

In next week's Cultivator we will give two articles on fig culture, addresses by Mr. Roeding and Mr. Markarian at the recent state fruit growers convention.. In the meantime gather such fruit as is ripe enough to drop, place on trays and stack.

Making Chrysanthemum Stems Stronger

What can I add to my foothill soil that will make stiffer chrysanthemum stems? The soil is light, sandy loam and has been well enriched with stable manure.—Subscriber, San Bernardino.

This question was referred to Professor Charles B. Lipman of the state university and he answers:

"The tendency of plants to grow rank where an excess of stable or barnyard manure is employed is very well known and it is no more characteristic, of course, for chrysanthemums than for any other plant. I should, therefore, advise your inquirer to desist from the use of any more organic manure for at least two or three seasons and use superphosphate at the rate of 800 pounds to the acre, and sulfate of potash at the rate of 50ﾉ pounds to the acre to more nearly balance the plant food solution of the soil. The application of small quantities of lime, say at the rate of a thousand pounds to the acre, will also be beneficial.

Corn Worm.

This department recently gave information received from Mr. Hersom regarding the torch method of catching the moths of the corn worm. Mr. Hersom writes that he is receiving many letters and as these take much of his time he adds a word of explanation for Cultivâtor readers. Mr. Hersom states one inquirer asks, "Why not use coal oil?" but he fears the odor will keep the moths away. We think, however, that kerosene has been used successfully. A San Bernardino grower suggests the use of a frame 2x4 feet, four inches deep, with an electric light in the center, with oil. He states his first night's catch was 507 moths.

TABLE GRAPE SHIPPERS

(Continued from Page 27.)

the state legislature to have a law adopted that will prevent this malpractice in the future, but such a measure cannot be taken up in time for the present crop. We shall take other steps, however, to meet this problem this season. We are promised effective cooperation on the part of the prominent shipping firms, to correct this abuse of the past, and stop the shipping of sour green grapes this season.

The above are a few things the California Green Fruit Association can do.

To do them quickly and successfully requires your cooperation; that you come in and join hands with us for our mutual benefit.

Without pay or any hope or desire for pay, the present directors of this association have given time and money, attended local meetings of growers day and night, at their own expense to promote this association for your benefit and that of every other table grape grower. We have secured an agreement from all the prominent firms of table grape growers that they will use every practical effort (and they have adopted an effective working plan at some expense to themselves) to route and divert all grape shipments so as to avoid gluts at auction points and consequent ruinous prices. Heretofore competing elements among the shippers were forced to do the best they could under a poor system.

They have endeavored in the past to get together to improve the system, but for sundry reasons have failed to do so.

When this association brought the situation squarely before all of the prominent shipping firms and showed them their past methods of distributing were detrimental to the interest of the growers only and had to be corrected, these same shipping firms agreed with us and showed every inclination to cooperate and now have agreed on a working plan that will eliminate abuses of the past in this particular.

If we should accomplish no more than that, which we have already done, the existence of our association would be more than justified. What we have accomplished up to date means directly more money in the future for your shipping grapes.

What our association intends and hopes to accomplish will give some stability to your end of the grape business in place of allowing it to remain a mere gamble.

Can't you see matters in the right light and at once sign the enclosed subscription blank at the rate of $1.00 per acre for the shipping grapes you own? Sign now and mail at once in the self-addressed envelope enclosed.

We already have over 4000 acres signed up, but need your help. Enclosed find subscription blanks. Please fill out and subscribe for one share for each acre of fresh shipping fruit you own or lease. Par value of each share is only one dollar.

We have canvassed the field, but for numerous reasons many growers found it inconvenient to attend the local meetings. We have not the time nor can we afford the expense to make another extended canvass.

Sign the enclosed subscription blank and mail to our office. Do it now.

Yours for improved marketing conditions.—California Green Fruit Association.

EIGHT-HOUR LAW

(Continued from Page 31.)

possible to control soil, sunshine and ripening conditions, neither can we adjust the process of decay, to say nothing of the cooking of meals, currying of mules, etc. The adoption of such a law would bring about anarchy and result in upsetting all organized labor. It should be defeated.

Leonard Coates, Santa Clara County.

The eight hour law, as applied to the farmer, is almost unspeakable in its unreasonableness. Farmers are always complaining of the unfairness of a legislation which enacts laws and imposes taxes on the agriculturist who has the elements and natural forces generally to contend with, on the same basis as with the manufacturer, the merchant, or any calling tributary thereto.

Why then can any of the farmers themselves be in favor of making a factory or store eight hour law applicable also to farm help?

But the farm help itself would be the greatest sufferer, and it would all react with tremendous force on industrial progress everywhere.

It is to me inconceivable that it should be thought worth while that arguments should be needed to show the utter folly of such a movement.

The farm laborer is not a factory hand, with a boss standing over him. Outside of "rush" harvest days, much of the time he is paid for is spent in loafing, in wet weather, for instance."

GRAVENSTEIN SHOW

We have a letter from Secretary Kelly, of the Gravenstein Apple Show Association at Sebastopol, giving dates of August 3-9 for the banner event of all Gravenstein apple shows. Of course, as usual, the show will be held at Sebastopol. Mr. Kelly writes:

"Practically all of necessary money is now in sight and the work of raising the balance and interesting the people in working up exhibits will be actively commenced at once, as will the advertising of the show. Every effort will be made to make this the banner show of them all and to attract a banner attendance.

"Two districts have already promised exhibits that will cost the association nothing and the others are expected to have their plans ready in a short time.

"The business men of Sebastopol have been very liberal in providing funds for the show, the Petaluma and Santa Rosa Electric Railway has promised liberal support and the county supervisors will be asked to make an appropriation at their next meeting. There is little doubt but that they will do handsomely as they have done by other fairs."

SEEDLESS LEMONS

As there has been some inquiry regarding the commercial success of seedless lemons we have written Mr. Irving E. Bush of San Bernardino County as to the seedlessness of a lemon which he has been growing for some years and as to its reception in the market. We have from Mr. Bush the following:

"The fruit has always been marketed with the Lisbons as we have not had enough to warrant separate shipment. Mr. Bert Stevens, manager of the Rialto Fruit Company, who has handled all the fruit for several years, claims the seedless lemon is juicier and more acid than the other varieties but I have never believed this. It is, in my opinion, no better than the standard varieties, excepting its absolute seedlessness, which is thoroughly demonstrated, but is as good as the best.

"There will be considerable production in the near future from orchards now set, and then we will know how the market will take to it."

CALIFORNIA RESOURCES

The 1914 annual report of the California Development Board has been issued, and as has been the custom for years one feature is the admirable map of California, showing the products of various counties.

A summarizing or review of business conditions in California, together with production of various crops, building activities, progress in various lines and most attractive figures as to the year's productions in canned goods, fresh fruits, dairy products, sugar beets, and, in fact, all kinds of field crops are given. It is a report meant to increase our pride in our own state. We doubt not the development board will mail copies on request.

The July Highway Bulletin, just issued by the California Highway Commission for free distribution, gives some interesting facts about progress on California's state highway. The work in each county is given in detail. It shows that surveys have been completed on 1888 miles, and that 607 miles of this is either completed construction or under contract, the greater part being a paved road having a four-inch concrete base fifteen to twenty-four feet wide. In addition about 100 miles is pending award. The Highway Bulletin will be sent without charge. Address a request to the California Highway Bulletin, Rialto Building, San Francisco.

MONEY MAKING LITTLE LINERS

In this department we will insert your advertisement under a classified head for 11 cents per line per issue. No ad accepted for less than [illegible]. Our classified columns are the clearing house for our many thousand readers.

MACHINERY

FOR SALE—2ND HAND WIND MILLS, TANKS, PUMPS, ENGINES
RANCH MACHINERY
POTATO MACHINERY
We Manufacture New Galvanized Tanks, Guaranteed Special Price

1000 gallons, $19.50, 2000 for $29.50. Header, fine shape, $125; Champion Binder, $75. Whittman Power Baler, Mowers, Cultivators, Harrows, Plows, Sundries.

ENGINES

To 40 H. P., not the 10 per H. P. kind, but engines that will do the work. Pumps and Pump Fittings

HOW'S THIS?

Biggest little Pumping Outfit ever sold at the price, 2½ H. P. Horizontal engine, upright jack and belt, new, $98. Capacity, 1200 gallons 100 feet. Demmitt Co., upstairs, 120 N. Main, Los Angeles.

We have pumps, motors and engines of all sizes and for all conditions, which we will sell or rent. If you want a complete plant or any part, write us your needs and get our prices. Can give you special low price on engine and automobile oil, also belting Machinery & Motor Exchange, 756-768 S. Alameda St., Los Angeles, Cal. Main 6382.

For Sale—Used and new gas engines, 2 H.p. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild gas engines correctly. Get our prices. Lloyd, 806 N. Main, Los Angeles.

For Sale Cheap—Pumping outfit; 2 twin, 10-inch American pumps; 70 horse-power engine, oil burner boiler, oil pumps, etc. Apply to Mrs. A. A. Porter, Soledad.

MISCELLANEOUS.

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

FOR SALE
Perfectly equipped
propagating plant,
fine opening for an
all round man. Plenty
of deciduous and olive
budding.
Box 63, Rialto, Cal.

LIVE STOCK

Ohio Improved Chester White (O. I. C.)—A few male pigs of March and April farrow. Everything else sold Have a limited number of sows bred for October farrow. Am booking orders now for these. All stock cholera immune. Crated and registered free. C. B. Cunningham, Mills, Sacramento County, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor, Mayhews, Sacramento Co., California.

Thoroughbred Berkshire Boars of all ages from developed and large-boned hogs. Riccomi Bros., Mountain View, Cal.

Glenview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

Poland China Stock for sale, boars and gilts, D. M. Clark, Arlington, Cal.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

BEES AND HONEY

It Pays to keep bees and raise your own honey on the farm. We can supply gentle, Italian bees at reasonable prices any time. Write for our free catalog of bees, instruction books, supplies and fixtures. Spencer Apiaries Co., Box 14, Nordhoff, Cal.

RABBITS

New Zealand Reds, prize stock, young for sale; buy now and raise for the winter shows. Mrs. C. A Richey, R. F. D. 8, Box 557, Los Angeles

TREES.

Avocado Tree (Alligator Pears), the most valuable of all trees for California planting and surely the coming fruit industry. Some varieties stand more cold than oranges, grow faster, and require less care. I have several hundred fine, vigorous, field-grown trees of the Harmon variety from four to five feet tall, $3.00 each. Other standard varieties, including Taft, Walker, Ganter, Murietta, of various sizes and prices. W. A. Spinks, Duarte, Cal.

For Sale—One and two year-old Washington Navels and Valencia Orange Trees. Eureka Lemons and Marsh seedless grapefruit, for Spring 1914 delivery. Write for prices, or call and examine stock at Morris Citrus Nurseries, Cor. Juanita and Valley Center, R. F. D., Box 34, San Dimas, Cal.

The 1200-Acre Nursery, growers of 1500 varieties of trees and plants. OREGON NURSERY CO., Orenco, Oregon. Sales office, 522 Chamber Commerce, Los Angeles, Cal.

1000 Avocado Seedlings—Pots, also can furnish nice plants, bare root, at low price. A. A. Quint, R. D. No. 2, Pasadena, Cal.

For Sale—Eureka Walnut Trees, budded on Native Black Walnuts. Choice stock. Order immediately. Don't delay. Wm. Holve, Fullerton, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

Wholesale Prices—Guavas, 7c; Chamaerops Palms, 5c; Date Palms, 30c; Ferns, 5c. Ballou's Nursery, Pasadena, Cal.

Budded Citrus Trees and seedlings at fair prices. Will take auto or land. J. P. Butler, Jr., P. O. Box 145, Lamanda Park, Cal.

FARM LANDS FOR SALE.

VICTORIA, AUSTRALIA, WANTS SETTLERS

Special inducements; government land, railways; free schools; cheap irrigation; 31 years to pay for farms adapted to alfalfa corn, grains, fruit, etc.; climate like California, ample markets; reduced passages; special excursion next November. Free particulars from F. T. A. FRICKE, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

For Sale—Twenty acres adjoining prosperous town, one water stock in Mutual Water Co. with each acre Conceded to be the best beet and alfalfa land in the state. About 600 feet from the station and beet dump. Five-year beet contract if desired. Price, $200. M. G. McNeely, Alpaugh, Tulare Co., Cal.

For Sale—Seven acres fine land, eight-room residence, barn, etc., right on banks of Chehalis river; steamers land at door; quarter mile from station; two transcontinental railroads. Cost $3,000, sell for $2,500 cash. C. Daniel, Melbourne, Wash.

For Sale—40-acre alfalfa and fruit ranch, well improved, under irrigation, 2½ miles from Woodland, Yolo County. Easy terms. Call or write to Wm. Gould, Woodland, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

Ranches, homes, acres, lots, exchange; send for free list. Wilson Bros., Santa Cruz.

POULTRY

CROLEY'S POULTRY CONDITION POWDER

is a wonderful help during the molt.

Try some. Your dealer has it.

How to Make Money—Mrs. A. Basley's latest Poultry Book is without exception the best ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1. Order from Cultivator Publishing Co.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., successors to Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

Baby Chicks—Jumbo egg strain. White Leghorns, $9; best Anconas, $12; Brown Leghorns, $9; White Minorcas, $12 per 100. Sand Ridge Hatchery, Kerman, Cal.

Barred Rock and R. I. Red baby chicks. If you want to raise some broilers send me your order. Price $10.50 per 100 until September 15th. J. W. Lyon, Gardena, Cal.

White Minorcas—The most popular utility breed of today. Prolific layers of large white eggs. Baby chicks, $12 per 100; eggs. Order early. E. Cauble, Kerman, Cal.

Barred Plymouth Rocks — "None better." Special prices for May and June. Write for 'em. C. H. Vodden, Los Gatos, Cal.

SEEDS AND PLANTS

Luther Burbank Spineless Cactus (Only)—Live stock fed on this velvet cactus, grow fat; hens lay more eggs, cows give more and better milk, and horses grow sleek. Why not get a start in the best, costs no more to raise than that which they call just as good. Ten slabs for $5.00, with one fine fruiting sort free. Address or call at H. L. Bauers' Cactus Nursery, 4401 Hammell St., Los Angeles.

If you want choice varieties of Burbank's Spineless Cactus, address Mrs. Mary R. Miller, Lakeside, California.

$ $ $ $pinele$$ Cactu$. All varieties Burbank's fruiting and forage plants 10c up. Plant now. Black Bros.' Nursery, 455 Lucas, Los Angeles. $ $ $

Berry Plants and Rhubarb. My new Berry Book ready about October will be worth sending for. Louis F. Scribner, R. F. D., Pasadena, Cal.

Thornless Cactus Slabs for sale at 5 to 15 cents each. Chas. R. Hanna, R. D. No. 3, Riverside, Cal.

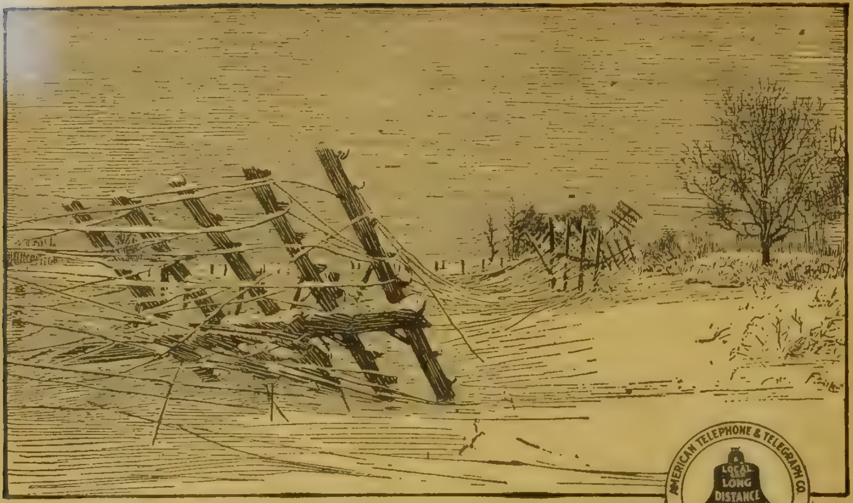
WANTED.

Poultry or Fruit—Young man, single, age 26, desires by Sept. 1st, responsible position on commercial poultry farm. Agricultural College training; ten years' experience. Would consider opportunity to learn something of the fruit business if work for winter is guaranteed. References furnished. State wages. G. Monteith, Box 135, Clint, Texas.

Nursery Trees Wanted—Almond, apricot, fig, lemon, olive, orange, peach, plum, walnut trees and grapes, for planting season 1915. Will you exchange for land, new subdivision, Yuba County? Dudley Moulton, First National Bank Bldg., San Francisco.

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property Free. American Investment Association, 12 Palace Bldg., Minneapolis, Minn.

Wanted—To hear from owner of good farm for sale. Send description and cash price D. F. Bush, Minneapolis, Minn.



AMERICAN TELEPHONE & TELEGRAPH CO. — LOCAL LONG DISTANCE TELEPHONE — BELL SYSTEM — AND ASSOCIATED COMPANIES

The Telephone Emergency

THE stoutest telephone line cannot stand against such a storm as that which swept the Middle Atlantic coast early in the year. Poles were broken off like wooden toothpicks, and wires were left useless in a tangled skein.

It cost the telephone company over a million dollars to repair that damage, an item to be remembered when we talk about how cheaply telephone service may be given.

More than half of the wire mileage of the Bell System is underground out of the way of storms. The expense of underground conduits and cables is warranted for the important trunk lines with numerous wires and for the lines in the congested districts which serve a large number of people.

But for the suburban and rural lines reaching a scattered population and doing a small business in a large area, it is impracticable to dig trenches, build conduits and lay cables in order that each individual wire may be underground.

More important is the problem of service. Overhead wires are necessary for talking a very long distance. It is impossible to talk more than a limited distance underground, although Bell engineers are making a world's record for underground communication.

Parallel to the underground there must also be overhead wires for the long haul, in order that the Bell System may give service universally between distant parts of the country.

Household Department

MONTESSORI CHILDREN

Pretty Sally Pettigrew
Had a playful impulse to
Brain the baby with a brick,
Papa whaled her with a stick,
Mamma rose in wild alarm
To stay the sire's avenging arm:
"Do not whip the little elf—!
Let her educate herself!
Let no parent dare prevent
A little child's development!"

Little Mable Mimblemunch
Hid a snake in Papa's lunch;
Papa bit the snake and died;
Little Mable sobbed and cried.
Patient Mamma only smiled,
Saying, "Do not weep, my child!
You did nothing but obey
The playful whim that came your
way—
And how should little children learn
Were they thwarted at each turn?"

—New York Evening Sun.

THE YELLOW PERSIAN

Written for the California Cultivator
By D. Lamont Smith

When Bob Hastings went on a long-deferred visit to his married sister, Dorothy, he had a notion that he was in for a quiet time in the country, and this impression was confirmed when he arrived at a small wayside station to find his sister and her husband, Donald Rogers, waiting his coming in their little car.

"Hello! Don and Dot," Bob called gaily, as he swung across to where the car waited in the shade of a pepper tree. "Say, where's the town?" he added, glancing around inquiringly.

"Oh, everywhere," said Dorothy, "only you cannot see it for the trees."

So they chatted as the little car took them swiftly home, where Baby Bob, left in charge of the maid-of-all-work, was impatiently waiting to go through Uncle Bob's pockets, having pleasant remembrances of this pastime when on a visit to town the year before.

As the car swung through the rose-bowered entrance to the Rogers home its occupants could see the little fellow standing in the driveway with legs wide apart, while he vigorously waved a red bandana handkerchief on the end of a bamboo pole longer than twice his little body.

"Isn't he a dear?" said his mother. "Just look at those rosy cheeks."

"Some kid, all right," said Bob. Then as the boy's father stopped the machine to pick the lad up, he called cheerily:

"Hello! Little Bob. Come see what Big Bob has for you."

With a loving hug for mother and father, the child climbed to his uncle's knee, and the search for hidden treasure commenced at once, but it really was no search at all, for every pocket seemed to hold something that boys like. A candy dog here, a rabbit there and now a monkey with a long, springy tail that you held while the monkey dropped to the floor, then bounded right back to your hand in a most uncanny way.

Soon as the treasure hunt was over they left the car and entered the pleasant bungalow, where, after a tubbing, Uncle Bob felt himself able to do ample justice to the dinner that Jennie, the maid, had just announced.

Though it was past Little Bob's bedtime, his mother had consented to his remaining up for dinner with the grown-ups, in honor of Uncle Bob's first visit to the Rogers home. Thus it happened that during a lull in the conversation the baby's voice was heard:

"Mother, the Cat Lady was here aden today."

"She was? What did she do?"

"She didn't do nuffin. She just looked for that big yellow cat."

"Bob!" cried Dorothy, "I'll disown you as a brother if you don't catch that cat."

"Sure thing I'll catch him. What will I do with him when I get him?"

"Just give him to that poor woman. She is as deaf as a post and she moved into the old Brown place a month ago and that cat—a perfect beauty he is, too—doesn't seem to like his new home and won't stay there, but prowls 'round the country like a robber and she has worn herself to a shadow trying to catch him. Don here tried, too, but that cat keeps just far enough away so you cannot put your hand on him."

As Dorothy concluded her rather disjointed account, Donald Rogers said laughingly:

"For the peace of this household, Bob, I hope you may make good your boast. That cat has become the bane of my life. The old lady has neither chick nor child and she cares for that ungrateful animal above everything on earth, and to see her tramping round day after day and often far into the night has gotten on Dot's nerves to such an extent that she talks cat all day and dreams cat all night. You have a month to stay here and if you can't capture that feline in that time Dot will never forgive you."

"I'll get him, all right," said Bob.

But his brother-in-law only smiled.

* * *

The next day was one of California's best, and as Bob Hastings strolled through his brother-in-law's eucalyptus grove, he thought life in the country was well worth while, with the green underfoot and the warm sun overhead. But as he emerged from among the tall and slender trees and stood to view the panorama of vale and mountain that lay before him, he was startled to hear a child's voice say:

"Don't cry, Missus Lady, Uncle Bob is going to catch him for you. He said he would, his own self."

Peering carefully around, Bob discovered his little nephew and a woman, whom he correctly surmised to be the Cat Lady, seated on a rustic bench at the edge of the grove. The boy had evidently been trying to comfort the woman, for just then she looked up, and, understanding that the child was sympathizing with her, although she could not hear his voice, she smiled through her tears and patted his shoulder kindly. Then, rising slowly, she walked away, while the youngster watched her for some time, finally turning to discover his Uncle Bob regarding him with quizzical kindness.

"Well, kiddie, I suppose it is up to us to get that cat, all right. But how we are going to get him is more than I know. Can't you think up some scheme that will do the trick?"

"I don't know, Uncle Bob, unless you fish for him?"

"Fish for him? And what bait would you use, young man?"

"Mother says kindness is the best bait she knows."

"All very well, sonny, but it seems to me some meat would be even better if there was only some way of keeping hold of the meat while the cat ate it. By cricky! I've got an idea and I believe it will work, too. Say, Bob, has your dad got a fishpole about the house somewhere?"

"Yes, father has two poles, and I has a whole lot drowin' in the back yard."

"Bamboos, eh? Nothing better."

Hoisting the boy to his shoulder, Hastings made his way rapidly back to the house, determined to put his plan into execution at once.

"Say, Dot, got any tough meat about the place? And I want some catnip, too." Then, in answer to his sister's look of amazement, "I'm going after that cat."

With Little Bob skipping gaily ahead, Big Bob proceeded through the house to the bamboo clump, where a strong but slender rod was soon cut and trimmed ready for use. Then Dorothy appeared with a small piece of tough and gristly meat and a bottle of catnip extract.

"Will this do?" she laughingly asked.

"The very thing," said Bob. "Now for a fishing line."

This was soon secured from Donald's stores, and Bob proceeded to fasten one end of the line securely to the bamboo rod, while on the other end a cat's-bite of the toughest portion of the meat was firmly tied and then drenched with the catnip water.

Thus equipped and with a few sandwiches in his pocket in lieu of lunch, Hastings went valiantly forth in pursuit of the yellow Persian truant.

"Don't expect me until you see me, Dot," he called to his sister as he marched away. "I'm not coming back until I get him."

But though he searched diligently through the localities the animal was supposed to haunt, it was not until the sun was low in the west that he glimpsed a magnificent long-coated yellow cat with a bushy tail stealing quietly toward the poultry yards of what Hastings decided was the most perfect little home place of the many fine ones he had viewed that day.

Drawing the bottle of catnip from his pocket, he drenched the meat afresh, and followed softly down the alley after the cat. The animal was apparently aware of his presence, but showed no fear. Instead, he would stop and stare boldly back at his pursuer with an air that seemed to say plainly:

"Well, what do you want?"

Then on again to the yards of the model home, where he promptly climbed the closely boarded fence and dropped lightly into an unoccupied poultry run, in the center of which was a neatly painted feed and storage house with the door invitingly open. This the cat approached with cautious boldness, while Bob viewed his actions from the alley with a mingling of hope and apprehension. Hope that the cat would enter the building and apprehension that he himself would not be able to reach the door in time to prevent his escape.

After a careful investigation of the interior and a glance back toward the fence to see if his pursuer was near enough to be dangerous, the yellow Persian decided that all was well and stalked majestically through the door.

No sooner had he done so than Bob, who had watched his actions through a crack in the fence, rapidly removed his shoes and with a swiftness and noiselessness equal to that of the animal itself, scaled the fence and gained the door before his quarry had taken the alarm. Swiftly passing inside, Bob swung the door closed behind him and advanced cautiously toward the startled cat, but the animal retreated as far as the building would allow and for some time repulsed all of Bob's advances, whose first thought was to make friends with his captive, and this he eventually succeeded in doing by bribing him with meaty scraps which he had brought along for just such use.

By the time the yellow Persian was purring contentedly in his arms the best part of an hour had passed and Bob was beginning to feel as hungry as the cat had been. So, moving slowly with his prisoner and keeping a sharp watch to prevent an escape, he attempted to open the door, but found, to his surprise, that it was securely fastened on the outside.

Releasing the now friendly cat, Hastings repeatedly tried to force the door, but unsuccessfully. It was stoutly built and the lock was a good one. Realizing that his efforts were unavailing, he desisted and turned his attention to discovering other means of escape. But the building being without windows, light and air entering through two small openings near the roof only, Bob reluctantly concluded that rescue must come from the outside. So, to attract attention, he pounded vigorously on the door and called lustily, but, receiving no response, his outraged feelings found expression in a

"Well, I'll be jiggered! What do you know about this, you yellow bandit? Nice pickle you have gotten me into."

Bob would have felt even worse if he could have known what was happening on the outside.

For at that moment a Weary Willie came ambling down the alley to where Bob had left his shoes and catfishing outfit. Said Willie had traveled far that day and his footgear was in a state of disrepair that may be aptly described as being most "holey."

Imagine,—then, the tramp's delight at perceiving a pair of perfectly good tan shoes by the roadside with nobody in them.

"Fer the love of Mike, wot goodhearted guy donated these here 'kicks' to a poor bloke as hasn't done nothin' to deserve 'em. Seems to have been fishin', he does. Here's luck to him anyhow."

Thus communing, the hobo quickly replaced his soleless brogans with Bob's well-made shoes and promptly took his departure, leaving in exchange the shapeless remnants he had just discarded.

In the meantime daylight was quickly fading and Bob again endeavored to make himself heard. This he did at intervals of several minutes, but he eventually concluded that his efforts were simply wasted energy, and, as darkness came, proceeded to make himself as comfortable as circumstances would permit. This was accomplished by arranging some sacks of grain to form a couch and placing another sack to serve as a pillow. Then, as the night was cool, he piled more sacks around his bed, and, removing his coat, snuggled between the sacks, with the garment as a covering.

The yellow Persian had viewed these preparations with approval and, on their completion, scrambled purringly down and insisted on sharing the couch.

"Well, old cat," said Bob, "this sure is a go. If we just had something to eat and a long drink of water, we wouldn't be so badly fixed. As we haven't, we will just have to go to sleep and forget about hunger."

(Continued next week.)

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle.

Breakfast.

Stewed Crabapples
Oatmeal
Jelly Omelet
Muffins
Coffee

Lunch or Supper

French Stew
Corn Muffins
Creamed String Beans
Spiced Pears
Cookies
Tea

Dinner

Roast Lamb, Mint Sauce
New Potatoes in Cream
Baked Tomatoes
Apricot Sherbet
Sponge Drops
Coffee

Jelly Omelet

Beat four eggs separately. Add to well beaten yolks four tablespoons of milk, pepper and salt to taste, and lastly the well beaten whites. Into a hot pan put a generous lump of butter. When melted pour in the omelet mixture. As the eggs begin to whiten draw up carefully from the bottom with a spoon, letting the raw part run out until all is equally cooked. Just before folding spread with jelly. Turn on to a hot platter and dust with powdered sugar.

French Stew

Place a piece of suet in bottom of kettle and try out. When hot and well melted put in a piece of beef weighing four or five pounds and turn until nicely browned on all sides. Add a few sliced carrots, one or two sliced onions and one cup of hot water. Allow to cook slowly for several hours, or until the meat is thoroughly tender. It may be necessary to add a small quantity of hot water from time to time, especially if gravy is desired. Thicken slightly and serve.

Baked Tomatoes

Peel and slice tomatoes a quarter of an inch thick. Place in layers in a pudding dish, season with salt and pepper and a very little sugar. Cover and bake half an hour. Fifteen minutes before serving remove the lid and allow to brown. Just before taking from the oven pour over the top two or three tablespoons of cream and melted butter.

Sponge Drops

Beat to a froth three eggs and one cup of sugar. Stir into this one heaping coffee cup of flour in which one teaspoon of cream of tarter and half a teaspoon of soda are well mixed. Flavor with lemon. Drop on buttered pans in teaspoonfuls about three inches apart.

Blessed indeed are the mothers who have a goodly supply of gumption—that is, those qualities which make strength of character, which give the power to see and do aright. The word "gumption" is strictly Hoosier and they say "Gumption is the ability to put the grease where the squeak is." May the mothers of our land leave no stone unturned until they realize fully just what and where the squeak is in their household, and then apply the grease with such a liberal hand, that all our boys and girls will soon have such well developed bumps of gumption they will be ever ready to lend a hand to help.

There are souls in the world who have the gift of finding joy everywhere, and of leaving it behind them when they go. Their influence is an inevitable gladdening of the heart. It seems as if a shadow of God's own gift had passed upon them. They give light without meaning to shine. These bright hearts have a great work to do for God.—Faber.

HAY

Under date of July 3, Scott, Magner & Miller say:

Receipts of hay for the past week were 2,906 tons; last week, 1,996 tons. The majority of this consisted of new crop of poor to medium quality, practically no fancy hay having arrived. The market remains quiet. Receipts of alfalfa have been limited, but there is practically no demand whatever at present, feed being abundant in most all districts. Straw is in light supply as well as demand.

Citrus Fruit Market

LOS ANGELES, July 8, 1914.

Fortunately the orange market is looking somewhat better than a week ago. The Fourth of July trade cleaned up the market of practically all offerings. Navels are all out of the way and but very few sweets yet to go. With reasonable care in distributing the shipments from this time on Valencias will be cleaned up at fair prices.

The lemon market is in the dumps again, partly because of abnormal shipments from the Medterranean. There are afloat today over a half million boxes of lemons coming to the United States. When it is considered this is almost as large as the entire year's output of California lemons it may be seen that some time will be required to absorb this enormous quantity. Besides this immense importation 50 degree weather is prevailing in many centers. The only consolation is that California's supply at this time is somewhat short.

Shipments.

Shipments of oranges from Southern California to date since November 1, 1913: 31,315 cars; lemons, 2,221; total, 33,536. To same date last season: oranges, 11,912 cars; lemons, 1,787; total, 13,699. Total of all citrus fruits two years ago this date, 30,120. Tulare County shipments to this date: oranges, 5,872 cars; lemons, 30; total, 5,902. To same date last season: oranges, 1,855 cars; lemons, 107; total, 1,962.

NEW YORK, July 6.—Seventeen cars Valencias, three sweets, one St. Michaels, one seedlings, three mixed, one lemons sold. Market firm, fully 25 cents higher. Cloudy.

VALENCIAS—	Avge.
Forget-met-not, T.C. Ponca	$2.65
Red and Blue Label, C.C. Lindsay	2.85

Veterinary

Sore Shoulders

I have a horse with sore shoulders that I cannot heal. Her side became chafed and runs matter. She continually gnaws her side unless tied in a narrow stall, and this spreads the disease to her mouth and eyes. She eats heartily and is in good flesh. What treatment is necessary?—Subscriber, Lindsay.

For the sore shoulders apply the following lotion: Chloride of zinc, one dram, and water, one pint. Wash the parts clean and when dry apply the lotion. It will need this treatment once a day for several days. Be careful and do not get the lotion into the eyes. It will not injure them, but will smart for a time.

Barb Wire Cut

Horse has a badly swollen hind leg caused by a barbed wire cut which exposed the bone. This filled in after a couple of months. She has pretty good use of her leg, but I cannot heal the wound nor reduce the swelling.—Subscriber, Lindsay.

To heal the leg get an ounce of nitric acid and with a small swab apply some of it to the raw surface. This will form a scab and when it comes off apply the acid again. Repeat this until three or four scabs are formed, when it will probably take care of itself. Each time before applying the acid grease the parts below so the acid will not run down and get on the skin. The swelling will go away gradually when you commence using her.

Lice

A 20-year-old horse, in good condition otherwise, has been troubled with itch on the neck near the mane and around the ears for the past six months. It does not act like mange. The hair is rubbed off from about a dozen patches from one to two inches square in size and the skin feels thicker there than the rest. The constant rubbing is making some raw sores. It was called eczema by a veterinary surgeon and several others, but the remedies seem to afford no relief. I have applied several remedies, including carbolic acid solution, liver of sulphur and resinol ointment with little or no results.—Subscriber, San Jose.

Try the following and let us know if it does the work: Get a quart of sheep dip and put half a teacup of it in a gallon of warm water and soak the parts well with it. Repeat this treatment every three or four days until about four applications have been made, then use a light grade of engine oil and rub in plenty of it over the affected parts. Trouble of this kind is caused by a very small louse. The large blue louse comes from the hen roosts, but the small white ones come from some other source. They burrow around the roots of the hair and cause a great deal of irritation. The above remedies will end the trouble if thoroughly applied.

Sick Sow

I have a sow eight months old which for the last two months has had no use of her hind parts, but drags them on the ground. Have given her copperas and sulphur and bathed her hips with turpentine, but she gets no better.—Subscriber, Indio.

Get the following from your druggist: Tincture of nux vomica, two ounces; tincture of juniper, four ounces; salicylate of soda, half an ounce; acetate of potash, one ounce, and enough water to make one pint. Mix and give a tablespoon twice a day.—Dr. Wm. Petrie.

Break Your Heavy Soil or Hard Pan With

Beet Sugar Lime

This test shows the actual result of using Beet Sugar Lime on a heavy soil or hard pan—2% being added. The action of such a small quantity, certainly shows the value to your soil.

When added to the cultivating surface, 3 to 5 tons may be used with excellent results, according to the condition of the soil.

Beet Sugar Lime mixes so thoroughly that the soil never goes back to the heavy, clodded state again. And in hard pan the particles cannot cement as they formerly did, even when broken up with a subsoiler.

Irrigation and winter rains cause the lime carbonate to seep into the soil and become available to the root system, unlocking the other plant foods that were inactive in the soil.

Beet Sugar Lime contains Nitrogen, Phosphoric Acid and Potash to the value of over $2.25 per ton, in addition to the Lime Carbonate. It is not injurious to any form of plant life, making it one of the most valuable fertilizers.

Price $2.45 per ton f.o.b. factory, car lots, loaded bulk. A very low freight rate is secured. Send for sample and booklet.

Beet Sugar Lime Co.

Box B **Pomona, Cal.**

"As TRUE as the Name"

"AMERICAN"

"Superior from Every Standpoint"

Surface Irrigation Pipe

Made in lengths of ten feet each, from a single sheet of galvanized steel, with a heavy taper collar riveted to one end, making total length 10 feet 6 inches.

"AMERICAN" pipe is made with the "lock seam" or turned joint—contains no rivets, except at collar. A riveted joint has only 70% of the strength of the sheet metal, while a turned joint has 100% or more. This means that "AMERICAN" pipe will last as long as the sheet steel. It is practically indestructible, and it is impossible to produce leakage in this pipe, as the turned seam is DOUBLE LOCKED and soldered. It is the pipe you will eventually use. Write for Illustrated Catalog.

We also manufacture steel tanks, wagon tanks, watering troughs, dipping tanks—in fact, anything in sheet metal. We make RIVETED pipe for underground use only.

POMONA DEEPWELL PUMPS

Especially built to stand up under heavy deep well lifts.

Pomona Pumps are used in connection with dug, bored or drilled wells from 8-inch inside diameter up, with capacities of 50 gallons per minute up to 1000 gallons per minute; built for pumping from a depth of 75 feet to and including 500 feet.

Competent Pomona engineers, thoroughly familiar with irrigation problems, are at your disposal to consult with and help you solve your water difficulties.

Call and see us or write for further details. Pump catalog No. 54C will be sent free on request if you state the depth and location of your well.

Pomona Mfg. Co.
Pomona, Cal.

Located in the center of the largest deep well irrigation district in the world.

POMONA GATES AND VALVES FOR CEMENT PIPE IRRIGATION are conceded to be the best. Specify and insist on getting "Pomona."

Vol. XLIII No. 3 LOS ANGELES: THURSDAY, JULY 16, 1914 One Dollar Yearly

Practical Milk Houses

Notes and Photographs Taken by Dr. Leroy Anderson Give Fund of Information as to Satisfactory California Milk Houses and Their Equipment

The dairy law of 1911 says definitely that a dairy shall be deemed unsanitary "if a suitable milk house or room is not provided and maintained, properly screened to exclude flies and insects. Said milk house or room shall not be located in or be a part of any residence or dwelling house, or any barn or poultry house, and shall not be used for any other purpose whatsoever." The milk house must be separated by a distance of at least 100 feet from any pig pen, horse stable or manure pile, or any other place from which foul odors may arise. This is the state regulation, and its enforcement is in the hands of the state dairy bureau. City boards of health, as, for instance, Los Angeles and San Francisco, have special regulations governing dairies which supply them with milk, and under these the city dairy inspectors may visit any dairy in the state which ships milk or cream to that city. Thus the dairyman must watch out for both city and state inspectors, but in regard to milk houses, the rules do not materially differ.

It is pleasing to note the increased attention that is being paid to the care of milk and cream through the milk room. Every new dairy being established erects a milk house as soon as possible. The dairyman who sells cream usually calls it his separator house, but the use and intent is the same in any case. It is a place to take the milk immediately from the milking barn for cooling or for separating and a place where only milk and milk utensils are kept. It must have a concrete floor well drained and be on a concrete foundation. A very suitable milk room is the tank house. One of the best milk rooms I have seen is on a Stanislaus dairy and is the ground floor of a tank house, the first story of which is entirely of concrete. This makes a cooler room and affords sanitary walls as well as floor.

The illustrations in Fig. 1 is a view or a new milk house on a Yolo county dairy of 20 cows. The house is 8x10 feet on the ground and 8 feet high at the plate. It has two windows, each 30x33 inches, well screened, and one door. The door is not yet provided with a screen. The structure is 2x4 inch studding about 16 inches on centers, covered with 8-inch rustic siding, and the roof is shingled. The inside is rough, but for best sanitation should be ceiled and painted. The drainage is directly through a pipe into the irrigation ditch close by. The house has a concrete foundation and floor and cost $50, which included everything except a day's help the owner gave the builder in making the concrete floor. The cart in front is used to wheel the milk in 10-gallon cans from the dairy, a necessary and handy thing in saving time and strength. This dairyman sells cream for buttermaking.

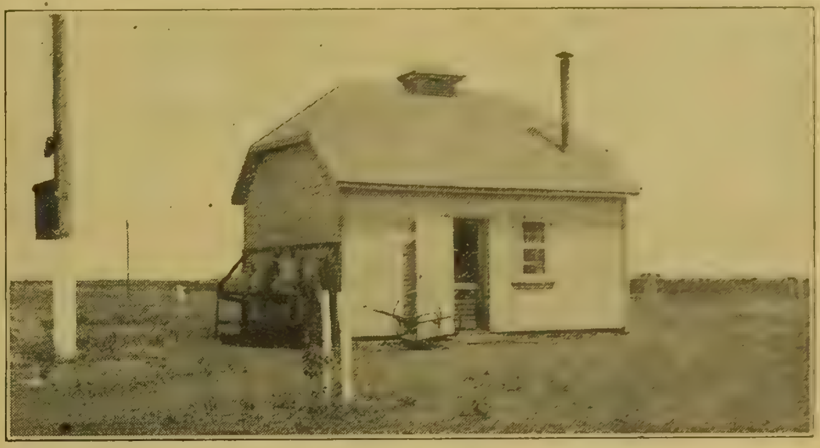

Fig. 4

Fig Culture in California

Status, Possibilities and Methods Described by Geo. C. Roeding in an Address Before State Fruit Growers Convention at Davis

To produce an article of food of recognized value is a source of satisfaction, but there must be another incentive, the industry must be profitable. This is the determining factor which means the continuance or the relinquishment of any business enterprise, whether it be fruit growing or any other occupation.

Does fig growing in California pay? True, we must compete with the cheap labor of Europe, but we have done this successfully in other branches of fruit growing, and the very fact that the harvesting of a fig crop can be carried on to better advantage by child labor than any other is an additional incentive to engage in the industry. Conceding that our wages are higher, it must be remembered that our help is more efficient, and this combined with our better methods of handling, places us in the position to compete in figs as well as in other fruits.

It has been demonstrated that White Adriatic figs at three cents a pound are more profitable than raisins at five cents. Smyrna figs can be raised fully as cheap as the ordinary varieties, the only additional expense being caprification, but as this does not cost over two cents a tree at the very outside, it is a matter not worthy of consideration. It is safe to assume that Smyrna figs, even when produced in large quantities, will never bring less than three cents per pound, and for many years to come five cents and over will be the prevailing price. No class of dried fruit outside of the fig possesses so many dietetic qualities, and with a good article of food like the fig there is an unlimited field for expansion. The dried figs which were being marketed from this state prior to the successful establishment of the Smyrna fig industry precluded any great expansion due to the inferiority of our figs as compared with the imported article. Experience has demonstrated that there is only one variety of Smyrna figs of any value for drying purposes, and this has been designated as the "Calimyrna." This is identical with the variety grown in Smyrna under the name of Lop Injir," which is the only fig used for export. The name "Calimyrna" is a copyrighted word, and is a contraction of the two words "California" and "Smyrna." The Calimyrna is recognized in the trade as the only fig grown in California worthy of being classed as a competitor of the imported Smyrna fig of commerce.

In order to assure others who may desire to market this fig under their own brand I wish to go on record now as encouraging the use of this name on all packs of genuine Smyrna figs grown in California. Although having the exclusive right to reserve this name for my own pack, I have never objected to its use by other packers, but have, on the contrary, encouraged it in all instances where the figs to be marketed were the Calimyrna.

There are thousands of acres of land in California in the interior valleys in which the fig can be grown successfully and profitably. The requisites for making commercial fig culture a success are a summer temperature ranging from 90 degrees to 110 degrees in the shade from July to October with an entire absence of rain and comparatively dry atmosphere.

This does not necessarily mean that figs cannot be grown elsewhere, but rather that where conditions such as these prevail every branch of the industry is open to exploitation, from the shipping of fresh figs to the canning and preserving and finally to the drying, which is after all the only absolute and dependable method for the disposal of this crop, for the grower then has the proposition under his complete control. Figs have been marketed in this manner for hundreds of years, and although we do not wish to minimize by any manner of means the canning, preserving and crystallizing of figs, in its last analysis all of these processes will only take care of a very small part of the crop, when it takes its place as one of the great fruit industries of this and other states having climate and soil conditions and possibilities of irrigation similar to our own.

The annual production of Smyrna figs in Asia Minor varies from 25,000 to 30,000 tons, and at least one half of this crop is sold in the United States. The output in the United States, all—or practically all of it—comes from California, and is from 3,000 to 5,000 tons annually.

A failure of a fig crop in California has never been known, and we will venture to say without fear of contradiction that it never will be. Fig buyers are so certain of their annual fig crop that it has been customary for a number of years in Fresno County to make from one to five year contracts with growers for the crops on their avenue trees and for entire orchards, the purchaser paying in advance for the expected crop. The price paid depends largely

At Last!

Frost Protection Without Smoke

Dunn's Smoke Consumer can be applied to any orchard heater.

It is compact and fits under the umbrella cover of the present heater.

It is the finishing touch which E. W. Dunn promised to work out for the fruit growers who bought 175,000 of the No. 7 Dunn Down Draft and Center Feed Orchard Heaters last season.

It is as great an improvement as an electric light is over a tallow candle, and is ready for this season.

Be sure to see it before you place your order.

It is cheap, it is simple, it is compact, it is substantial, it is efficient, it is mechanically right, it is scientific.

It is economical, giving off more heat per pound of oil than any other orchard heater ever built.

Citrus and Tropical Fruits

THE PERUVIAN FRUIT-FLY

By C. H. Townsend, in The Journal of Economic Entomology.

The Peruvian coast region has long been known to be infested with the fruit-fly, a pest which attacks citrus as well as deciduous fruits, particularly during the month of February.

In February, 1912, a guava tree at Sullana in the Chira valley, Peru, was completely infested by Trypetid maggots, and the fly was to be seen among the fruits at the same time. The writer reared numbers of these maggots, and flies were produced from the 4th to the 10th of March. This same tree, having shed all its diseased fruits during February, produced a second crop in March, which contained only one infested fruit containing one small maggot, thus indicating the distinctness of generations.

As the insect does not appear to have been identified before, the writer describes it under the name of Anastrepha peruviana, and mentions the characters which distinguish it from the closely allied species A. fratercula.

As a remedy he recommends spraying the foliage before the fruits begin to ripen, or as soon as the presence of the flies is noted, with the following mixture: lead arsenate, five to 10 pounds; chancaca (brown or black cane sugar in cakes), 25 to 50 pounds, and water, 100 gallons. The chancaca must be dissolved in boiling water before adding to the arsenate solution. Variation in the amount of arsenate added is required for different kinds of foliage, guava and orange standing much more than peach, and the sugar content should vary in the same proportion.

A "TREMENDOUS BOOM" COMING FOR PACIFIC COAST FRUIT

A writer in the New York Times Annalist declares that the opening of the Panama Canal will have much meaning for the Pacific Coast grape business, as well as for the entire fruit industry of that region. Because of the canal it will be possible to ship fresh fruit by water without any rehandling in transit. From California fruit orchards to markets in Europe the distance is 6,000 miles or more, over which no transshipments will then be necesary. Heretofore, one of the chief things that have kept American fruits out of the European markets is the sevenfold handling necessary in sending a box of lemons, oranges, or apples. But when the canal is opened "ships laden with fruit will be able to run from port to port with unbroken cargoes," rehandling being "practically eliminated." It is believed that American fruit will then arrive in London or Paris in better condition than fruit now reaches London and Paris from Spain, Italy, or northern Africa. Hence Pacific Coast growers anticipate a "tremendous boom in their fruit trade oversea." The writer says further on this interesting subject:

"Our exports of oranges, when there is a good crop so there is a surplus over what we eat ourselves, are nearly 1,300,000 boxes, valued at a little more than $3,300,000. We did not export any lemons in 1911, but the year following we shipped abroad 44,366 boxes, and in 1913 we exported 58,428 boxes, valued at $383,083. Of apples, green or ripe, we exported nearly 1,500,000 barrels in 1911. Two years later the number of barrels sent overseas was 1,920,921, and their value $7,417,400. The exports of dried apples in good crop years recently have been worth close to $4,000,000. Of prunes—that great staple dainty of the unwealthy—we are now exporting not far from 100,000,000 pounds a year, an item of more than $5,500,000 annualy. Our total fruit exports, including those shipped in tins, came to nearly $33,000,000 in 1913.

"Years ago the oranges were put in refrigerator cars as soon as they were packed. It was soon seen that this was an expensive way of cooling them, for the fruit when it was placed in the cars was of the temperature of the air—and the orange-picking and shipping season in California comes in hot weather. The cost of refrigeration under these circumstances was excessive. Therefore, great precooling plants were established, buildings where a thousand car-loads of fruit could be brought down to the proper shipping temperature at the least possible expense. Today trains of freight-cars, already iced, are run into these great warehouses and loaded, so that the fruit does not suffer the slightest change in temperature. Some of these precooling plants belong to the railroads handling the fruit; others to the growers' associations.

"It is this incessant care that has made the American orange famous wherever it has been introduced. In England the only complaint has been that the supply was insufficient. There has been no objection to the rather high price—nine to 12 cents each for the California seedless or 'navel' orange."—Literary Digest.

INSECTS INJURIOUS TO OLIVES

By Del Guercio, Giacomo, Florence, Italy.

It is well known that the eggs of the black scale of olives (Saissetia oleae=Lecanium oleae) hatch out in large numbers from the 10th to the 20th of June, and that quantities of larvae are to be found on the leaves and branches. This period is therefore considered to be the most favorable time for the destruction of the insect. However, in 1912, according to the writer's observations in Apulia, hatching of these eggs continued from the beginning of June until the middle of August, or about 65 to 70 days. A fact intimately connected with the preceding is the emission of excremental liquids ejected to considerable distances by the females of Saissetia and of juices caused by the repeated punctures of the insects; the quantities of these are responsible for the appearance and spread of fumagine, as the writer has been able to observe experimentally.

Further, the period of activity of the female scales is in agreement with that of the development of the olive fly (Dacus oleae), which feeds on the sugary secretions of Saissetia and of the no less abundant olive sucker (Euphyllura olivina=Psylla oleae) and infests the olives. The destruction of these insects is therefore necessary on account of the favorable conditions which they produce for the development of Dacus oleae. The appearance and rapid spread of species of Cicada and Cicadetta or Tettigia, which, by the excretion of large quantities of liquid on the surface of the leaves, produce conditions favorable to the development of the olive fly, would necessitate similar measures.

In Italy olives are attacked by the larvae of a Swift moth (Zeuzera pyrina=Z. aesculi.), known locally as "Rodilegno," "Tarlo bianco," "Tarlo giallo," on pears and apples; though very destructive, this has so far been neglected; it attacks a number of trees, including fruit trees, but in Apulia, Calabria, Sicily and Tuscany prefers olives. In Apulia it is only found in large numbers on the most improved varieties (known as "Ogliarole"), whilst the "Olivastro" and the wild olive are almost immune; the same may be said of the Nardo olive, which is also partially resistant to Dacus oleae. In this district the larvae of Zeuzera often attack good-sized branches, provided the bark is still smooth, so that in the hot weather these dry up and drop all their flowers and fruit; many such branches, however, do not die off at once, but remain as centers of infection for several years, producing no fruit. Many laborers in these districts are very skillful in finding the grubs; eight persons may go over 12,000 to 14,000 trees in three weeks, collecting 50,000 to 60,000 grubs, which are paid for at 10 lire (8s, or $2) per thousand.

Observations by various entomologists on pear trees, have shown that the moths lay their eggs during July. The writer has found that in Apulia the larvae hardly begins to pupate before the second half of July, while the majority do not do so till the middle of August. Consequently only the earliest moths appear at the beginning of August, the bulk emerging much later. For this reason collecting of grubs should not begin before August, and should continue till the latest pupae are destroyed.

In the spring of 1912 the olives in the neighborhood of Serranova (Apulia) flowered with extraordinary vigor, many shoots bearing a thousand or more flowers, but only some 30 to 50 set owing to damage by olive suckers (Euphyllura olivina) and Hyponomeutids (Prays oleaellus). On some branches only one of these insects occurred, on others both. The damage extended over a considerable area and amounted to some millions of lire.

In the second half of June quantities of Ageniaspis emerged from the Prays pupae, though many were themselves parasitized by an undetermined microbe within the pupae.

Both in Apulia and in Liguria the writer has observed that the Prays moths fly away from the olives in June and July and seek shelter under the thickest, lowest and most shaded leaves of vines, and to a less extent of pears, plums, cherries and figs. By means of dishes containing poisoned treacle or other liquids, or only water (used in experiments for the control of the olive fly), it was found that the flight takes place principally at the end of June and in the first few days of July. Treacle attracted them more than the other liquids, and water hardly at all. The writer believes that they leave the olives in search of moisture, and in particular of liquids on which they can feed.

With regard to the olive-bark borer (Hylesinus oleiperda), the emergence of the adults seems to take place later than is recorded by Costa, in 1912 it lasted from just before the middle of May to nearly the middle of July; in 1913 it was the same, and the females were found still wandering on the bark as late as July 25.

Experiments showed that this insect will not attack cut twigs, even if they are kept fresh, as those confined with such twigs died without egg-laying; on twigs attached to the tree, egg-laying was more abundant on whole twigs than on those cut back. It is thus evident that healthy trees are liable to attack.

It was previously believed that the olives remaining after the disappearance of the olive suckers were safe, but the writer has observed that they are liable to fall in July if situated near parts of the flowering shoot which have been pierced by the sucker. This explains why flowering shoots with 20 or 30 olives on, but only attacked at the base, sometimes wither up completely. This "running off" of the young olives goes on throughout July, and, according to the writer's 1912 observations, stops when the fruits are nearly as big as peas.

THE BUSINESS OF FARMING

"The Business of Farming," by Wm. C. Smith, published by Stewart and Kidd Company, Cincinnati, two dollars. The Cultivator will be glad to secure the book for its subscribers at the above price, or, including a year's subscription to the Cultivator, at $2.75.

This book, dedicated "to the earnest company of thoughtful humanity-loving men and women who are working with might and main to briug about better methods of farming and farm living, by which the fertility of our soils may be increased and maintained, and that our farms may have better homes and home surroundings," has a world of information for any one who loves the soil. We quote two or three reflections found in the book, which will give an idea of the style of the writer and the interesting and informing things which he says:

"Business is nothing more than being industriously engaged in the affairs of some occupation from which we derive our support.

"Farming is our biggest business. It feeds the nations of the world and is the basis of all prosperity and happiness, and therefore should receive our biggest consideration and be safeguarded by our best brains and legislation.

"In pioneer days when farming implements and machinery were of the crudest kind, requiring muscle to use them, brawn, more than brains, was needed in the business of farming, in order to rescue soils from the wilderness of timber and prairie growth."

The book opens with a historical resume of agriculture, beginning as far back as the time when the command was given, "Let there be light." Several thousands of years are passed over with a sentence or two and, in fact, the historical part of the book is perhaps of lesser importance, though really the most interesting. Following that, other chapters deal with discouragements, worn soils, equipment, preparation, plowing, seed selection, care of machinery, importance of live stock, cost of operation, farm credits, home building and even the country graveyard has a little attention.

VON LIEBIG'S "LAWS OF AGRICULTURE"

To Justus von Liebig, the celebrated German chemist, more than to any other man, belongs the credit for blazing the first trails through the unexplored world of mysteries involved in the transformation of the elements in the soil, water and air into vegetable life.

He formulated the following four "Laws of Agriculture," which stand today as the clearest, most concise statement extant of "the case for the soil:"

First: "A soil can be termed fertile only when it contains all the materials necessary for the nutrition of plants, in the required quantity, in the proper form."

Second: "With every crop a portion of these ingredients is removed. A part of this is again added from the inexhaustible store of the atmosphere; another part, however, is lost forever if not replaced by man."

Third: "The fertility of the soil remains unchanged if all the ingredients of the crop are given back to the soil. Such a restitution is effected by manure or fertilizers."

Fourth: "The manure produced in the course of husbandry is not sufficient to maintain permanently the fertility of a farm; it lacks the constituents which are annually sold off in the shape of grain, hay, milk and live stock."

The almond is being extensively cultivated in Palestine and will soon rank among the important exports of the country. This year's exports amounted to 528,000 pounds, as compared with 317,000 pounds in 1912. France takes the largest portion of the crop.

FERTILIZERS

Fertilizers may be complete or incomplete; direct or indirect.

A complete fertilizer is one that contains each of the three elements of plant food, nitrogen, phosphoric acid and potash.

An incomplete fertilizer is one that contains only one or two of the three elements, nitrogen, phosphoric acid and potash.

A direct fertilizer is one that contains any or all of the three plant food elements, nitrogen, phosphoric acid and potash. A direct fertilizer is used for the plant food which it contains.

An indirect fertilizer is one that does not contain nitrogen, phosphoric acid or potash. An indirect fertilizer is not applied for the purpose of adding plant food to the soil, but in order to make some of the plant food already in the soil more available. The chief indirect fertilizers are land plaster, lime and common salt.

Land plaster, gypsum or calcium sulphate. These are different names for the same compound. Gypsum or land plaster is nothing more than the sulphate of lime rock which has been ground exceedingly fine.

Quicklime and calcium carbonate. When limestone is burned the resulting product is calcium oxide or quicklime, sometimes called stone-lime. When exposed to the air it becomes air-slacked and is then calcium carbonate or carbonate of lime.

Deciduous Fruit Culture

MAKING VINEGAR

A San Joaquin County subscriber requests information as to making vinegar from cull apples. We reprint from a former Cultivator an article which gave most explicit instructions taken from a bulletin of the New York experiment station. First, we might mention that our subscriber will necessarily have to get a small cider mill or in some way crush apples and press from the pomace all the juice, or at least it would be better to do so, though it is possible if apples are crushed and allowed to ferment, afterwards racking off the fermenting liquor, it will prove successful. The writer once made an excellent vinegar by using a barrel of pear parings over which water was poured, and after fermentation the liquor was racked off, allowing it to ferment in the natural way.

In making vinegar never use tin or galvanized vessels for the liquid; wooden containers are the best.

Probably the best way of handling these parings or cull fruit products would be to allow to stand and ferment a few days, then rack the liquid off into a barrel containing a little vinegar. This will hasten the process. When made in this way, any rinsings from molasses barrels add to the strength and quality of the vinegar. But here is the article by the experiment station on the making of cider vinegar:

Making Cider Vinegar.

When apple juice is left exposed to the air, it is gradually changed, losing its sweet taste and giving off bubbles of gas more or less vigorously. The most prominent change is in the conversion of the sugars into alcohol and carbon dioxide gas. This change is shown as the alcoholic fermentation, and is caused by a vegetable ferment, or an enzyme, which is produced by ordinary yeasts. Cells of the yeast plant are so widely distributed that they get into apple juice abundantly under ordinary conditions.

Theoretically, we should be able to get from 100 parts of apple juice about 51 parts of alcohol. In actual practice, we are not able to obtain this amount, because some of the alcohol is lost by evaporation and some is lost by certain chemical changes that take place along with the alcoholic fermentation. In general, we may expect that in the usual fermentation of apple juice, 45 to 47 parts of alcohol will be obtained from 100 parts of the sugars of apple juice.

It may be mentioned that in freshly expressed apple juice, prepared from sound fruit, I have never been able to find any alcohol. Sweet cider is, therefore, a strictly temperance beverage; but, perhaps, not every one could be trusted to tell just where the dividing line is between "sweet' and "hard" cider.

The rapidity of alcoholic fermentation depends largely upon temperature. In ordinary cellar storage, at a temperature of about 50 F., it takes about six months to convert the apple juice sugars entirely into alcohol. At a temperature of 75 to 85 F., this time can be reduced one-half or more. The higher the temperature the more rapid is the fermentation. There is one serious objection, however, to temperatures above 75 F., and that is the loss of alcohol by evaporation. This is favored also by the rapid escape of gas when the fermentation is very vigorous.

After alcoholic fermentation is completed, another change takes place—the alcohol is converted into acetic acid, and the final object of the vinegar maker is the production of acetic acid. This change is brought about through the agency of microorganisms, called acetic bacteria, these being entirely different from those that change sugars into alcohol.

For the effective conversion of alcohol into acetic acid or of cider into vinegar, there are needed: (1) acetic bacteria; (2) an abundant supply of air, and (3) a temperature of between 65 and 85 F.

There is commonly noticed in vinegar a very elastic, slimy, tough, transparent skin of a yellowish-white color; this skin is commonly known as "mother" of vinegar. This appears to be formed by the growth of the acetic bacteria on the surface of the liquid. When one skin has formed, it settles sooner or later and in its place another is formed, and this formation and replacement continue as long as air is supplied under favorable temperature conditions and as long as unchanged alcohol remains.

The chief change that takes place in the acetic fermentation of alcohol is the taking up of oxygen by alcohol, which is thus changed into acetic acid. Hence air is an absolute essential.

Acetic fermentation as usually conducted by farmers, takes place much more slowly than the alcoholic, often requiring eighteen months, and in some cases two or three years. The most satisfactory results have been obtained by us at temperatures between 65 and 75 F.

The following is a practical method of inoculating cider with acetic bacteria. When the alcoholic fermentation has stopped, which, under favorable conditions, should be in one to three months, the cider is placed in barrels, filling half full and then adding one-fourth volume of old vinegar. Mother of vinegar is then prepared as follows and added: Expose in a shallow, uncovered crock or wooden pail a mixture of one-half old vinegar and one-half hard cider at 80 F. In three or four days the surface should be covered with a gelatinous coating, which is "mother" of vinegar. A little of this carefully removed with a wooden spoon or flat stick should be laid gently on the surface of the mixture of cider and vinegar prepared as described above. Do not stir it in, because the acetic ferment grows only on the surface where it can have an abundant air supply. In three or four days the coating should spread itself over the entire surface. This coating should not be broken or disturbed as long as the acetic fermentation is going along satisfactorily. When this method is followed the vinegar should be complete and marketable in one to three months after the alcoholic fermentation is finished.

In this connection we may mention also vinegar-eels, which are so unpleasantly common in many home-made vinegars. They are produced by the small flies that infest exposed or decaying fruits. One method of keeping them out is to keep the apple juice from continued exposure. The placing of a loose cotton plug in the bunghole of the barrel in which fermentation takes place effectively keeps out the flies after the juice is barreled. When vinegar is found to be badly infested with eels, the only safe treatment is to heat the vinegar to 185 F., not above this, and strain, cleaning and steaming the barrel before replacing the vinegar and keeping the bungholes closed. Vinegar eels, besides being offensive to consumers, cause the vinegar to deteriorate sooner or later.

FIGHTING RED SPIDER

Yellow mites, sometimes called red spiders, are beginning to do serious injury to foliage on prune and almond trees in the Sacramento Valley. The pest was very serious last year, the trees in many orchards being entirely defoliated. The mites are very small and suck the juice from the under side of the leaves. A dusty brown appearance indicates their presence. Several treatments are used. One is to dust sublimed flowers of sulphur into the trees with a blower by throwing in with the hands or dusting on through a coarse bag, in the case of small trees. The sun liberates gas which kills the mites. Another treatment is to spray with atomic sulphur at the rate of 6 to 7½ pounds to 100 gallons of water. To be effective the spray must be driven to the under side of the leaf with force so that the entire surface is covered and gas can be liberated everywhere that there is a mite. Wetting the top surface of the leaf does little, if any, good.

Another treatment that is being used is flour paste made with cold water—six pounds of flour to one gallon of water—this added to 100 gallons of spray. To this is added three to six pounds of sublimed flowers of sulphur. The paste gives more even distribution of sulphur and makes it stick—and "gums up" many of the mites.

It is important to start to fight this pest at its first appearance, for it soon destroys the tissue of the leaves, and the tree must make new leaves instead of wood and fruit.

This mite is one of the most annoying things in deciduous fruit growing in the Sacramento Valley, but one that every one should be always prepared to fight. Supplies of material for spray, and sprayers, should be kept in readiness all the time, then no delay ensues in stopping damage before it gets too much of a start.

THE STATUS, POSSIBILITIES AND METHODS OF FIG CULTURE IN CALIFORNIA

(Continued from Page 51)

on the size of the trees, but the contracts range from $1.00 to $5.00 per tree, and it is no unusual thing for these contracts to involve sums as high as $5,000.00 per annum. The contractors bear all of the expense of harvesting; the grower merely prunes and cultivates his orchard under this arrangement. These advance contracts have been made exclusively with the White Adriatic figs, for it is only within the last few years that the Smyrna fig orchards have reached the age of full bearing.

The preserving of figs has never been attempted on any scale in California, and this is really very surprising considering the enormous demand there is for figs in this shape and that California draws all of her supply practically from Texas and Louisiana.

One firm in Texas puts up a large quantity of these figs which are known there as the Magnolia and which are in reality the Brown Turkey, a rather inferior fig at the best. The tree is a very poor and unsatisfactory grower; nevertheless when preserved the figs are very sweet and delicious, the heavy syrup being largely responsible for this flavor. The drying of the figs in Texas is out of the question owing to the rainfall during the summer months, therefore this is the only method for disposing of their crop. Considering that this inferior fig can be manufactured into a commercial product by using proper materials to create a desirable flavor, what are the opportunities in this direction for the Calimyrna, White Adriatic and White Endich, all of which possess merits making them preeminently better adapted to this than the very inferior Magnolia fig.

Unlike many other fruits, the fig in order to produce a high grade article must be allowed to remain on the tree until it loses its original form, shrivels up and drops off. Sometimes it is necessary to jar the trees slightly if the shriveled figs do not drop, or knock them off with light bamboo poles. From the orchard they are hauled to the drying ground which should either be a hard piece of ground or an alfalfa field.

The figs are dumped on trays which are stacked at once, for, as a general rule all figs—with the exception of the very large ones—are dried sufficiently so that when they come on to the drying ground no further exposure to the sun is necessary. One of the universal complaints of California figs has been their tough skin. This is not due to any unfavorable climatic or soil condition, but is the result of over-drying. The sorting of the figs may be commenced two days after they have been placed on the trays. All the figs which have a slightly leathery feeling to the touch are thrown into a pile by themselves in the drying shed, and the bird picked and split figs into the cull pile. These are not lost by any means, but sell readily at two and a half to three cents per pound. The soft figs are packed on trays as before, the trays are stacked, and the figs remain on them until they reach the proper degree of dryness when they are thrown in with the others. It is advisable to leave the figs in the pile, which may be from three to six feet deep without the fruit being damaged in the least, for a period of two weeks, turning the figs over with a scoop shovel at least once during this period or oftener if time will permit.

Just prior to delivering to the packing house give the figs a thorough washing in a brine having not less than four ounces of salt dissolved in a gallon of water. A prune dipper may be used to good advantage for this work. The figs should remain in this brine for a period of 10 to 15 minutes, depending on their condition. They are once more placed on trays, two or three inches deep, exposed to the sun for half a day to allow the water to drain off, and the trays are again stacked. Within two days they can be dumped into sweat boxes and are ready for delivery. This processing not only cleanses the figs, but it softens the skins, causing them to feel like a kid glove when squeezed between the fingers, and in addition to this the figs present a bright and most inviting aspect. They are a delight to the eye and appeal to the palate as no other fruit does.

Bear in mind that the fig tree is of a spreading habit, and is also a great surface feeder. Therefore avoid planting the trees too close together. On sandy soil trees may be planted 25 feet apart, but on a good loamy soil 30 feet is a good distance, while in exceptionally rich land 35 would be preferable. On the general run of soils 30 feet is a safe distance to plant. As a border tree for enclosing orchards or vineyards or for aligning avenues, the trees are not only very striking in appearance and exceedingly ornamental, but also very profitable.

Although the fig will stand all kinds of neglect after it is established, too great emphasis cannot be laid on the close attention which must be given in transplanting the trees from the nursery to the orchard. The roots of a fig tree are very susceptible to exposure, hence should be carefully covered in transferring them from the trenches to the field. Before planting cut off all the bruised and lacerated roots and make a fresh cut on all the other roots.

It is surprising what effect the puddling of the roots will have in preventing their drying out even in cases of severe winds, and we cannot emphasize the importance of this too strongly. As an illustration of this point we wish to say we have taken trees which were in leaf, and after puddling the roots, thrown them into the open air for a couple of hours, and not a leaf would wilt, while trees not treated in this manner would dry up, root and top, in ten minutes exposure. To make a puddle dig a hole 18 inches deep, two feet in diameter fill it partly full with heavy soil, mi

Electric Auto Horn

Finely finished, black and nickel, 11 inches long, fits any car, 9 feet wire, terminals, push button, universal bracket. Loud noise, low price. Thoroughly guaranteed one year. Shipped anywhere prepaid. Money back without question if you don't like it. Tremendous value and adds style to any car. Other styles at $3.90 and $4.90. Style shown here, $5.90. Send today. Immediate shipment. Try it out and if you don't like it send it back and get your money. We pay all expense. Remember this horn is sold by a concern established here in 1892.

ARNOTT & COMPANY

Wholesale Agricultural Implements

112 South Los Angeles Street LOS ANGELES

with water until you have a muck the consistency of a heavy paint. Dip the roots into this, and give no further concern about their drying out, even if exposed to the direct rays of the sun for a short period.

The tree when planted should not stand more than three inches deeper than it stood in the nursery row. Never neglect to settle the earth around the trees with not less than 15 gallons of water. After the water has soaked away fill in with fine soil without tamping. No greater mistake can be made than to wait for rain or for water to be turned into the irrigating ditches. After the tree is planted cut back 20 inches from the ground and cover the wound with rubber paint or coal tar.

The first winter cut the branches of the one year trees back to about 12 inches, leaving not more than four to make the head of a tree. Have these distributed in such a manner that there will be sufficient room for them to expand without crowding as the tree grows older. The second season cut not less than two-thirds of the new growth, leaving not more than two shoots on each of the frame work branches. Any branches on the underside of the limbs having a tendency to droop to the ground should be removed. The third season shorten in the new growth about half, leaving the same multiple of branches on each of the previous year's shoots as were left the year before. In after years the pruning is limited to the removal of branches which cross or interfere with each other and checking of branches making an excessive growth. Young trees should always be protected with tree protectors to prevent sunburn. The fig tree is just as responsive to good care and thorough cultivation as any other variety of fruit tree, and the bearing capabilities will be commensurate with the care bestowed on the trees while young. But very little fruit is to be expected till the trees are four years old.

As you will observe, my remarks have been made almost exclusively with reference to the Smyrna fig as grown in California. I do not wish to be placed in the position of minimizing in any way the value of the Adriatic type of fig. Until the introduction of the Calimyrna and its successful establishment as a commercial article the White Adriatic, of all white figs grown in California, was the first, and is still being extensively shipped and probably will be for many years to come, although I am of the opinion that as the industry develops, and it surely will now that we have a fig equal to the world famous Smyrna fig, with the additional fact in its favor that the fig as grown in California is superior to the imported article, it is only a question of a short time when practically all of our dried figs will be of this type. White Adriatics may be grafted over to the Smyrna without incurring any severe loss to the grower, except that he will be out of the crop for say three years. There is no fruit grown that has not its shortcomings, and the Calimyrna is no exception to the rule, but its bad points are so infinitesimally small as compared with the Adriatic that any objections that are made to it are not worthy of consideration. The very fact that the White Adriatic sours badly if there should happen to be any cool weather during the early part of the drying season, and also that it is necessary to sulphur the figs, not only to obtain a better color of the skins but also for the purpose of neutralizing the sour taste which is so pronounced in these figs, is enough to relegate it to the background.

As to the Mission or California Black, I want to say that it is deserving of more prominence than it has received among our dried fruits. Its skin is so thin when dried that one is led to believe that it has no skin, and as to the flavor, it certainly stands next in this respect to the Calimyrna. Trees are enormous growers and very heavy croppers. The first crop is well adapted for shipping purposes, and the second crop not only ships but dries well. This fig can be dried at even less expense than the Calimyrna. The only objection that may be cited against it is its color, and just why this happens to prevent its ready sale I am not prepared to say, except I do know that some seasons the fig sells well and there is every encouragement for more extensive planting, while at other times this fig is a drug on the market and difficult to sell at any price.

That fig culture in California is still in its infancy must be conceded when it is borne in mind that our annual production is less than half of our imports. All of these figs are grown in the Meander Valley, which is 85 miles long and only a few miles wide. You will be somewhat surprised when I tell you that 30,000 people are engaged in the handling of this one crop in Smyrna, and that the United States is today the greatest consumer of these figs—all this in spite of our rather high duty. Do you know that California is destined by reason of climate, soil and the establishment of the blastophaga to wrest this trade from Asia Minor and divert it to our own people? Is this not of itself an irrefutable reason for the affirmation that Smyrna fig culture is not only feasible but is sure to be highly profitable in this state.

KANSAS HORTICULTURAL SOCIETY

The Cultivator has just received Transactions of the Kansas State Horticultural Society, an organization formed some 50 years ago. Kansas fruit growers have formed a far more definite organization than have those of California. The biennial publications contain a great fund of information as to horticultural practices in that state.

FOOD AND FLAVOR

Food and Flavor, a Gastronomic Guide to Health and Good Living, by Henry T. Finck, published by The Century Company, New York, at $2.00 net, postage 18 cents.

"It is not too much to say that the most important problem now before the American public is to learn to enjoy the pleasures of the table and to insist on having savory food at every meal," and this book enters into the discussion of savory food in a most entertaining and instructive way. The book is not a book of recipes, it has little to do with the preparation of food, but it has much to do with the discussion of foods, their manner of handling and marketing, and especially does it discuss impure and improper foods, which it terms "our denatured foods." For instance, in referring to "smoked" ham, bacon and fish, it refers to the modern day method of using liquid smoke instead of the slower and possibly more expensive method of smoking meats. It refers to the analysis of one of these liquid "smokes," which it says consists of creosote, aniline dye and the salt of iron, the salt of iron presumably added to this so-called smoke in order to quickly give the appearance of natural rustiness. The London Lancet refers to this practice in rather caustic language and demands that tampering with the purity of food in this way should be strongly dealt with.

The cause for large packers using this liquid smoke in the preparation of ham and bacon is given in this paragraph:

"In conclusion, let me whisper in the reader's ear the secret why those who handle pork products and fish are so eager to get rid of the smoke house that during the process of smoking the ham and bacon may lose up to 20 per cent of its weight."

Referring again to the paragraph first quoted above it may possibly be that some reader of the Cultivator might think it was a book intended for the wealthy, in order to derive greater pleasures from more savory foods. This we do not believe is the case, for note these two paragraphs from a chapter on French supremacy:

"A grumbler might ask 'What's the use trying to learn new things from foreigners when so many of our families can hardly afford to buy the ordinary meats and vegetables for any kind of meal?'

"But it is precisely because foodstuffs are becoming expensive that we ought to look to the older and less extravagant nations of Europe for guidance. Our government has been commendably alert in this matter, doing a most useful service by issuing Farmers' Bulletin 381, which, as previously pointed out, shows how, by expert cooking, the cheaper cuts of meat may be made to yield more nutrition as well as more appetizing flavor than the choicest cuts as at present prepared in American households."

The general trend of the entire book is toward securing greater return for the money, both in actual nourishment and in the pleasures which come from the sense of taste, which the author maintains is a material factor in the health of the people It is a book in which the man will have as keen interest as will the woman.

There are 28 chapters and an excellent index. To give an idea of the more general aim of the book we quote some of the chapter headings: Ungastronomic America, Vital Importance of Flavor, Denatured Foods, Science of Savory Cooking, Future of Cooking, Epicurean Italy, German and Austrian Delicacies, British Specialties, Gastronomic America, etc.

RELATION OF ALFALFA TO SOIL IMPROVEMENT

The unqualified recommendation as a soil improver that is continually being given alfalfa is responsible for the very common belief that this crop is one which should be grown extensively on poor or unproductive soils.

It is true that, being a legume, it benefits the soil through the addition of nitrogen fixed by organisms forming nodules on its roots, and through its roots it not only supplies considerable quantities of humus, but greatly improves the mechanical condition of the soil.

In producing profitable yields of hay, alfalfa utilizes large quantities of phosphorus and potassium, which must be obtained either directly from the soil or from added fertilizer.

Whether alfalfa is a soil improver is a question which cannot be answered without some explanation. In the sense in which the term is commonly used, alfalfa is not a soil improving crop, since it cannot be utilized in the same manner as cowpeas, soy beans, crimson clover, or hairy vetch for the building up of wornout or depleted lands. On the other hand, it enriches the good soils through the nitrogen and humus added to the soil by its roots and crowns when the old field of alfalfa is broken up and also by the mechanical action of its roots upon the soil. Furthermore, the preparation of the land prior to seeding the alfalfa and the treatment in the way of top dressing and fertilizing which follow during the few years of its existence doubtless have a very beneficial effect on the crops succeeding it.

In actual practice, then, alfalfa improves good land, but cannot be considered in connection with poor land, as it is not a profitable crop to grow on unfertile soils.

If things don't seem to have any bright side at all, let me advise you to go to work and see if you can't do a little polishing on them somewhere or other.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Employers' Liability.

Is a person liable for damages in case of accident to household servants or chauffeur, and if so where should one apply for insurance?—Subscriber, Pasadena.

Household domestic servants are particularly excepted from the provisions of the workmen's compensation act, and the only liability of an employer for injury to one of them would be such liability as would arise by reason of negligence on the part of the employer. A chauffeur belongs to one of the classes of persons protected by the act. The act permits an employer to insure in a mutual or other insurance company against liability for compensation provided for by the act. The act also creates a fund known as the "state compensation insurance fund," to be administered by the industrial accident commission of the state for the purpose of insuring employers against liability for compensation under the act. Full information concerning rates, method of obtaining the insurance, etc., can be obtained from the Industrial Accident Commission, Hollingsworth Bldg., Los Angeles, or 907 Royal Insurance Bldg., 201 Sansome street, San Francisco.

Mother and Child.

Wife leaves husband and minor child and husband secures divorce and keeps child. In case they meet in a public place has the mother a right to talk to child if father does not wish her to?—Subscriber.

If the mother has never been deprived by court decree of the right to see and visit her child she still has that right notwithstanding the fact that the father is given the care and custody of the child in divorce proceedings. She can only exercise that right, however, at proper times and appropriate places. If there is any dispute between the parents as to what is a proper time and place, the court would have to settle that question.

Deep Well Vertical Motor-Driven Turbine Pump

High Grade Irrigation Pumps

The Jackson Deep Well Turbine Pumps are so carefully designed and constructed they have a higher efficiency than any other pumps of this type.

Our motor driven pumps are absolutely noiseless and have neither valves, rods nor gears to get out of order.

Fig Growing and Marketing

Address by Henry Markarian Before the State Fruit Growers Convention

The fig industry of California is annually becoming a great and important factor in the export trade of the state. A little historic glance may prove of some interest to you. Fig culture was first introduced here by the Spaniards. The variety planted was known as the Black Mission, and was grown in gardens and backyards, but had no commercial importance in furnishing figs for drying. At that time one could occasionally find them sold green in San Francisco and Los Angeles markets. The White Adriatic was introduced in Fresno County in 1884. My father, Mr. M. Markarian, planted the borders of his vineyard to this variety. His example was emulated by others who planted the boundaries of their vineyards to Adriatic fig trees. Very little importance was attached at the outset to fig orchards, as the growers were uncertain of fig culture ever becoming a profitable industry. This is the reason there are so few bearing orchards now.

The fig trees reached maturity, but there being no demand for them, interest in the culture of same lacked. This apathy towards a promising industry was directly attributable to the growers' lack of sufficient knowledge to appreciate the product, cure and put it on the commercial market.

In 1893 we established a packing house in our vineyard to pack raisins and ship to eastern markets. This proved a success. The following year we bought a few crops of figs; especially do I remember how the crop on a 10-acre orchard cost us only the sum of $10, which alone yielded about 10 tons of dried figs that brought good results. Similar low prices prevailed on other places, the crops practically being given away. At first we did not know how to handle the crop, but conceived the happy idea of packing figs just the same way as we were packing raisins. Thereafter our shipments consisted chiefly of raisins and figs. The first shipment of California figs in any manner that went out to the east of the Rockies was made in 1894.

We encountered a good deal of doubt on the part of the eastern houses as to the keeping quality of California figs, which we had to guarantee. Our efforts along this line were partly compensated by the reception accorded to the home product. As the industry advanced the demand for figs increased, thus affording a golden opportunity to the growers to stimulate fig culture. Others soon established packing houses to handle the crops for export trade. One of the primary causes of the successful California fig export trade was the destruction of Smyrna figs by a heavy frost in Asia Minor in the year 1898. That year the east largely depended for its supply on the California product, at which time Seropian brothers, packers, accumulated a fortune of $40,000 by having a corner in the fig market.

In 1900, through the efforts of Mr. George C. Roeding and the department of agriculture, the fig wasp, know as blastophaga, was established in Roeding's Smyrna fig grove. This revolutioized the fig industry in California and opened a new era. The idea of Califoria figs being of inferior quality compared with foreign imported figs was soon dissipated by the introduction of the Smyrna variety in our markets. There are two grades of figs, the Smyrna variety and the Adriatic, which we offer to the eastern trade, the former being the king of figs.

I am a profound advocate of the Smyrna figs and I have several reasons for my advocacy. First, the superiority of the fruit; second, the quick maturity of the tree (Smyrna fig trees mature in six years, White Adriatic in eight years); third, the trees show very little or none of the root diseases so common to Adriatics; fourth, the trees are well adapted to an orchard form when they are planted 30x30 feet apart, whereas the Adriatic at this distance would not be satisfactory. The tendency of the Smyrna fig tree root is to go downward and deeper into the soil, while those of the Adriatic have a tendency to spread circumferentially in a shallow depth; fifth, because it is a fine and luscious fruit, infinitely useful and nutritious and free from souring. It may be shipped green and find a ready market with every prospect of good financial return.

Finally, the demand for Smyrna figs is greater than for any other variety, and I can safely guarantee that the market will not fluctuate on account of overproduction within the next 20 years. I am fully convinced, judging from unabated activities shown in the production of Smyrna figs, that this industry is destined to become one of the leading fruit industries of California. I do not exaggerate a particle when I say that 75 per cent of the anual fig output is consumed by the biscuit and pastry manufacturers of the country for making the well-known delicacies such as fig bars, fig jams, fig biscuits, etc.

To grow figs successfully one must study the nature of the soil and the climatic conditions. The best region to grow for drying would be that geographical portion of the San Joaquin valley that has Merced on the north, Bakersfield on the south, and commencing from the center of the valley, the closer you get to the Sierra foothills, the more satisfactory it is for this culture. Red, heavy and deep soil, with plenty of irrigation water is desirable. The red hardpan soil, if properly blasted, is good for fig culture. Although trees take a longer time to mature in this kind of soil, it will produce clean and elegant fruit, with hardly any splits. The life of the tree under these favorable conditions would almost be everlasting. In sandy soil (drift sand) and alkali, planting is an absolute failure. Another section fairly adapted for the culture of the fig is the region lying between Marysville and Red Bluff in the Sacramento valley.

Being one of the pioneers in Smyrna fig culture, I have faced many difficulties, but have overcome them with patience ad common sense experiments. These difficulties have now vanished through the giving away from time to time of the secrets by experienced growers to beginners, and the arduous, incessant work of Prof. G. P. Rixford of the agricultural department. My chief trouble arose in the early days from insufficient knowledge of caprification. After securing a collection of different varieties of capris, which was imperative in Smyrna fig culture, my most difficult problem was satisfactorily solved.

The annual production of figs in California is approximately as follows: White Adriatic, 5000 tons, 3800 tons being grown in Fresno County; Smyrna figs, 600 tons, 400 tons being grown in Fresno County; Black Mission, 300 tons, 100 tons being grown in Fresno County.

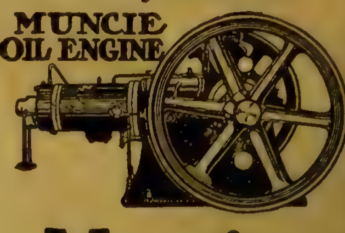
UNLOCK THE SAFE

If an old, rusty safe, with doors locked, fell into the hands of a farmer and if he knew that this safe contained $10,000, it would be a great incentive to try to unlock the safe and utilize the money. So also if a farmer has his soil analyzed and finds that it contains 30,000 to 40,000 pounds of plant food per acre, even if not available, this fact should be worth much to the farmer because it should give him a strong incentive to try and farm in such a way as to gradually make available for his crops this vast amount of plant food which is locked up in his soil. The plant food in the soil is the farmer's capital, or money just as much as the $10,000 in the old, rusty safe.

"Tillage is manure" is as old as the hills and as true. Introduction of air into the soil, which can only be accomplished by deep tillage, makes fertility.

Fuel Bills Cut Squarely in Two

When you use the



Muncie Oil Engine

The only engine from 20 to 100 H. P. successfully operated today in California on California fuel oil.

It's a wonderful engine—simple yet perfect—has no carburetors, battery, coil, magneto, gears or cams. It has only two essential attachments, the governor and the fuel pump.

The Ornamental Garden

RURAL IMPROVEMENT

Written for the California Cultivator
By Ernest Braunton.

From all parts of California come reports of civic awakening in rural districts. In the southern part of the state, where I am wont to wander at random, the individual rancher, especially the citrus grower, is busy devising ways and means to make his ranch attractive. Not only must it be attractive, but distinguished by one or more features of unusual beauty. We constantly hear of or see a mile of fence over which is clambering a solid mass of Cecile Brunner roses, or the ranch frontage is aligned and protected by a hedge of ragged Robin roses.

As little as I am tied to the office in the city, there comes a feeling of relief whenever called into the country, and nothing I see upon returning, aside from my own family, compensates me for what I have left behind in the way of rural charms and sufficiency. Why should not one garden in the country? As the Englishman said when asked if it was not wonderful to see so much water tumbling down at Niagara Falls: "But there's nothing to prevent it, you know." Nothing to prevent; everything to encourage. Why should we not have fine gardens in the country? What backgrounds and surroundings amidst the orange groves!

In rural districts there are no gasses, reflected heat from cement walks, limitations of parkways, competition for light and air and but a short time when the smudge pot casts its baneful soot upon the glorious natural crop of flowers growing under conditions so natural that failure is well-nigh impossible. One of the most serious problems confronting the city garden builder or designer lies in harmonizing the garden with its surroundings and obtaining a suitable background. From these perplexities and problems the rural districts are free; one reason why the present writer so loves his chosen field of landscape design in rural homes. There is, however, one point where a new difficulty arises. So beautiful, so satisfying is an orange grove that one is moved to exercise his utmost ingenuity to really embellish the boundaries, for how may one add to the beauty of the rainbow? The ownership of automobiles is now so unisal in the country, the good roads systems provide such magnificent highways, that no division between city and country is noticeable except the unusual and wholly artificial congestion as one nears commercial centers. The time is close at hand when the finest gardens, in extent, in appointment, in class of material, will be found amidst strictly rural surroundings.

Roses Require Rest.

Roses in California require the same amount of rest that winter forces upon them in the cold eastern states. To enforce this it is necessary to deprive the plants of water toward the close of summer. If roses have been standing in present position for several years, water heavily once right away and then give no more until the cool weather of autumn comes upon us. During this rest the leaves may turn yellow, even drop off, the bark on the softer growths may wither, but the plants will not be harmed. In October prune severely, remove all small wood, open centers, cut back two-thirds in length, irrigate and cultivate. When growth is well started, fertilize. Then you will get real roses.

Transplant Natives.

The present season has been a glorious one for native vegetation, and some of this should find its way into gardens this fall. Note what you would like to have for your premises and in September cut back the trees or shrubs heavily, leaving but little top; transplant to your garden, water heavily and if convenient cover the tops for two or three weeks. You will get an agreeable surprise in seeing a quick and vigorous response, and later in the rainy season, or at its close you will have all the native glory that you so much admired right in your own door-yard. Each year thereafter will find you borrowing from nature's bounteous supply.

Carnation Propagaation.

It often occurs that home owners have plants of fine carnataions of which they wish more stock but do not know the names of the varieties. It looks as if the easiest way out of the difficulty is to propagate at home rather than seek the uncertainties of the market with its attendant loss of time. As but a few plants are wanted layering is a better and far surer method of increse than by making cuttings.

Select strong vigorous side shoots, With a sharp knife cut half way through stem at a long, slanting angle. Dig away a little earth beneath this point. Rush the half-cut portion down in the soil and cover up. Keep well watered for some weeks, and at the end of the period examine the cut portion to see if the half-severed tip has rooted. When rooted freely the remaining part of the stem may be cut through and the young plant set out by itself. A large-sized plant may be surrounded by a score of such "layers", and if the work has been properly done all will readily root and quickly make flowering plants. While early spring is usually selected for this work, any time during the active season will bring success if sufficient care is exercised.

House Sites.

Care should be taken when choosing house sites in rural situations, for no skill on the part of the designer and planter can overcome great natural defects, though these may be somewhat lessened through the expenditure of funds. It is not enough that a site should command a fine view for it may yet be devoid of possibilities in planting or even planning. We must not consider all points from the site, for really the house should be set where it will look best, even though another site might present a finer outlook. If it is too hard of approach or appears forced into an unnatural position nothing in the way of planning or planting can compensate for the deficiency.

Highway Planting.

In California trees for street and highway planting may be procured and planted at lower cost than elsewhere. Therefore should we have more of them. When choosing suitable trees look about in your own neighborhood for the best that have stood the test of time. There is no better criterion. Do not think of writing to officials for advice when by using your eyes you can learn all you wish. It may be possible that peppers and acacias are what you should plant while some road overseer or other official is trying to make magnolias grow in upland hard-pan. Experience is the best teacher, and if you have had none, look about in the immediate vicinity for mute but incontrovertible evidence of fitness.

The Glorious Pepper.

The pepper tree is and ever will remain the most popular tree in the southern part of California. No matter how much warfare is waged against it as a host for the black-scale, the balance will ever stand in favor of the tree, for in-as-much as such pests must be kept under control on citrus trees why not exercise the same care with the pepper tree. This scale no more contaminates the pepper than it does the orange. If both are equally neglected methinks the pepper tree will harbor the lesser amount of scale. But while we fumigate, spray, fertilize and cultivate the orange tree it should occasion no suprise to find the latter most heavily infested.

The Matilija Poppy.

Each year I grow the matilija poppy my love for it grows deeper, for we have no plant native to California that is worthy of more extensive planting in the home grounds. With me it is not quite a pest, yet it rapidly spreads each year in my garden while neighbors cannot induce a vigorous growth on the plant; others cannot even establish one at all. After putting a young plant in the soil leave it alone; even neglect it, and success will be yours. If you cultivate or fertilize or over-water you will doubtless fail to establish this noble native plant.

BELLINGHAM BULB GARDEN.

As is well-known in the trade, the United States department of agriculture began some years ago an experimental bulb farm at Bellingham, Washington, after an exhaustive investigation of climatic and soil conditions, to learn if bulb growing might not become a domestic industry and obviate the necessity of importing from Europe. The results of the investigations carried on so far are embodied in a bulletin issued a short time ago by the department. The bulletin begins by saying that the United States today is one of the largest consumers of what are known as "Dutch bulbs." "The value of the annual imports of these extremely popular spring-flowering bulbs for planting out of doors and forcing under glass exceeds $1,000,000. The major part of these should, and it is believed can, be grown at home."

The garden takes up a strip of land about 250x1600 feet, 2½ miles west of Bellingham, which is in latitude 48 degrees north and about 122 degrees longitude west. The mean average temperature is 50.2 degrees, and the annual rainfall 30 to 40 inches. It is in the Puget Sound region and the soil is composed of silt loam, carrying a heavy quantity of decomposed organic matter. Thus far the work has been confined to the propagation and growing of hyacinths, tulips and narcissi. In 1908, when the garden was established, 170,466 bulbs were planted. In 1912 the number planted exceeded a million.

The bulletin says that "the experiments at Bellingham garden have demonstrated beyond question that narcissi of excellent quality can be grown there and that the Double Von Sion variety, one of the most popular of the forcing narcissi, and one that heretofore has baffled every effort to produce it commercially in this country, can be successfully grown in the Puget Sound region. The first flowers from imported bulbs of this variety are usually fine, perfect, double flowers of excellent substance and quality. The same bulbs if grown longer than the first season after being imported produce, as a rule, throughout the United States, with the apparent exception of the Puget Sound region, greenish, malformed flowers. The flowers from bulbs grown at the garden for three seasons were practically perfect and compared favorably with those from imported bulbs." The bulletin also says: "Tulips in variety can be successfully grown in commercial quantities in many sections of the United States. The tests so far show that tulips grown at the United States bulb garden are superior in several respects to imported bulbs." The hyacinth tests were carried on on an extensive scale and showed very encouraging results.

"Hyacinths are propagated naturally either by slab or by seed; artificially by bulblets secured entirely by scooping or scoring mature or so-called mother bulbs. The narcissus is propagated by seeds when it is desired to secure new varieties. The commercial method of propagation of the narcissus, however, is by offsets. The increase secured at the garden varies according to variety, from 99 to 380 per cent." The time required is from three to five years. "The propagation of tulips tested at the garden has been by offsets. The increase is from 67 to 273 per cent, depending upon the variety. The bulbs for the most part have been planted in beds, practically the same as hyacinths. If new varieties are desired, they are secured by means of seed."

"Before the department of agriculture will be justified in advocating the growing of so-called 'Dutch bulbs' as a commercial industry in this country, much remains to be learned regarding the climatic and soil conditions best suited to the crop; the selection, clearing, grading and preparation of the land (much of that in the far northwest which is now thought to be well located and suitable to bulb growing will cost from $75 to $150 per acre to put it in shape for planting, in addition to the cost of the land); the prevention and control of diseases affecting the crop, of which a considerable number are more or less serious; and the propagation, cultivation, fertilization, growing, harvesting, curing, storing, transportation, and marketing of the crop."

KILLING DANDELION WITH IRON SULPHATE

The Colorado agricultural college has conducted a series of experiments with killing dandelions in lawns, using four solutions, one of the strength of 20 per cent, one of 10, another of 5, another of 2½. The two stronger sprays killed all the leaves of the dandelion, also somewhat blackened the grass. It afterwards showed a darker and richer green than the untreated areas. The conclusions reached by those conducting the experiments are given as follows: It is evident that a 15 per cent solution should be practically as effective as the 20 per cent for this purpose, and that three applications, the first as soon as the plants are in full leaf in the spring; the second in about three weeks, and the last in midsummer, should prove effective in controlling this pest. Although the grass was very thin on the areas treated it soon began to thicken and by October 1st formed a fairly close sod. Nearly all the white clover was killed by the two strongest solutions. This could be replaced quite readily, however, by scattering a little seed over the soil after the last treatment, keeping the lawn well watered for a week or two. In treating lawns bordered by stone or cement walks care should be taken to keep the solution from wetting them, as it produces a rather permanent yellowish stain.

TOO MUCH TONGUE

After he had kissed her and pressed her rosy cheek against his and patted her soft round chin, she drew back and said:

"George, do you shave yourself?"

"Yes," he replied.

"I thought so," she said. "Your face is the roughest I ever—"

Then she stopped, but it was too late, and he went away with a cold, heavy lump in his breast.

IN GOOD COMPANY

A contemporary wants to know what's become of the old-fashioned man who used to say, "I says, says I."

When last seen he was standing on a street corner in close conversation with the old-fashioned man who says, "Sezee to me, sezee." — Cleveland Plain Dealer.

AN INSIDE VIEW

"My gracious boy," said his uncle. "you do certainly eat an awful lot for a little boy."

"Well, sir,' replied the boy, "maybe I'm not so little as I look from the outside."—American Boy.

TREES

Buy Foothill Grown Trees

For good roots, thrift, and hardiness they can't be beat. Quality considered they challenge all competition. We are prepared to furnish the best of everything. Olive, Almond, Peach, Pear, Plum, Prune, Apricot, Cherry, Apple, Walnut, Grape, Quince, etc.

Orders are being booked daily, and we urge you to not delay.

WRITE US

Silva-Bergtholdt Nursery Co.

Box 751, Newcastle, Cal.

Anybody can cut prices

—but it takes years of concentration and close study to produce a superior citrus tree.

When we tell you, therefore, that we are now selling the well known superior quality Teague Trees at prices as low or lower than anyone else — quality and responsibility considered — you can make up your mind that the present offers an exceptional opportunity for you to get your citrus grove started at a reasonable figure. Get in touch with us now. If you can't call—write for our quotations and suggestions.

CITRUS TREES EXCLUSIVELY

All Standard Sorts

We are the largest citrus nurseries in the world and can supply you promptly with almost any quantity of oranges, lemons and pomelos in all the standard sorts, as well as many specialties.

Call and See Us or Write Today

We will gladly give you full information and quotations. For 25 years we have been growing citrus trees exclusively and are the largest citrus nurseries in the world. You can gain some of the benefits of our years of experience by sending for our book, "CITRUS FRUITS" — handsome and unique in illustrations and get-up. It covers the industry from seed to market.

Price 25c postpaid. Get it.

QUOTATIONS GLADLY GIVEN

San Dimas Citrus Nurseries
(INCORPORATED)
Established in 1890 by R. M. Teague
San Dimas
California
U. S. A.

Teague trees are started right, grown right, and shipped right.

General Agriculture

POTATO CONVENTION

By Dr. A. J. Cook, State Horticultural Commissioner.

The potato emergency convention will convene at Stockton, not in August as previously announced, but on the 8th and 9th of September. This change is made at the suggestion of the United States department of agriculture and will bring to us Doctor Appel, a very noted potato pathologist from Europe, and Doctor Orton and Professor Stuart, experts from the U. S. department of agriculture, none of whom could be present at the earlier dates.

The Condition Stated

The tuber moth is a damaging pest of the potato. The caterpillar not only ruins the infested tuber but may be carried in it wherever the tuber may go, and so is a menace always. It is clear then that a state or region free of the pest is warranted in taking stringent measures to remain free. This necessitates action to restrain all importation of affected tubers. There are only two ways to insure this imperative necessity: Either the shipper must inspect so carefully and weed out so rigorously that no infected potatoes are shipped, or else all growers in moth-free sections must declare and enforce a strict quarantine. As we have not exercised the needed caution in making shipments, British Columbia, Idaho and Colorado, actually, and Oregon and Washington, practically, have resorted to the quarantine. Other states are likely to follow if we are not aroused to immediate and effective action. The magnitude of our potato interest is large, and the injury to our growers and shippers of this embargo is great.

Unfortunately this moth is widely distributed throughout our state, though many sections, possibly whole counties, are free of attack. This fact gains wide publicity through "Farmers' Bulletin 557" of the U. S. department of agriculture.

We quote: "For many years the potato tuber moth has been the worst potato pest in California. It has now reached the state of Washington and Southern Texas and menaces adjacent states." It is also reported from Colorado and doubtfully from North Dakota. In all but California its distribution is quite limited. This, of course, works doubly to make our danger the more imminent. What adds to the gravity of the situation is the fact that the moth has been in California for years and in the other localities but a brief period, and all the other localities are large consumers of our potatoes.

We see then that our only escape must come through education of all potato growers that the moth may be held in check by all growers, Orientals as well as Americans, and that inspection be so rigid that no infested potatoes are shipped from our state.

This convention is called to take steps to secure this education of all growers that they may eradicate the moth, and to arouse all to the absolute necessity of the most rigorous inspection that not a single infested tuber shall be shipped to any other state or any tuber moth-free section.

USE OF AUTO WITH LEAST EXPENSE.

"To what work shall I put my automobile in order to realize the greatest possible benefit? What amount of pleasure and profit can I reasonably demand from it, and what is the least up-keep expense I can calculate on in its operation?"

The answers to the above questions depend on a great many things—in the car as well as in its owner and operator. The wearing quality and working capacity of one car may be so superior to that of another car that any estimate as to upkeep is next to impossible. The care and knowledge and skill of one driver may be so much greater than that of another driver that no matter how efficient the machine may be which he handles it will give only a fair degree of satisfaction. Then there is the element of luck which always plays a very significant part in operating a car. Accidents which cannot be avoided, even by exercising the greatest care, may occur, bringing loss financial and otherwise. One farmer may make the purchase of a car a most profitable investment. His neighbor may curse the day when "the blamed thing was bought." The same make and quality of car, the time of purchase the same, the same care and judgment exercised in its operation, but not the same luck. Therefore it appears that care and skill and knowledge are factors which do not always count. Location plays an important part in the upkeep of a car. There are roads and roads, as every car owner has learned to his everlasting chagrin and loss. And some farmers who built their homes long before the arrival of the modern "road devil" are actually so located that it would be a neck-breaking feat to drive an auto up to their front door —a risk none would undertake except on a high wager.

Proper Care of Machine Necessary.

The best life preserver for any machine is proper care and use. By getting the most out of an automobile we, of course, mean that in point of service it has yielded a full return for the money invested in its purchase in the form of pleasure, utility and whatever has contributed to our benefit without subjecting us to more than a very reasonable expense in its up-keep. It is well, therefore, to spend a little time each day, if possible, in examining the machine to see where oiling is required and make necessary adjustments so that when needed the entire car is in tip-top running order. If the farmer takes the proper interest in the looks of his car he will go on for years with an outlay of but gasoline, lubricants and tire repairs. As the machine gets older the expense item will assume greater proportions. Bearings will wear out and need replacing, piston rings, spark plugs and such small items must be replaced by new parts. It becomes necessary therefore to give the car an occasional overhauling in order to ascertain its true condition as to pistons and bearings, etc., and to remove carbonized oil from the walls of the cylinder.

Knowledge of the Machine Necessary.

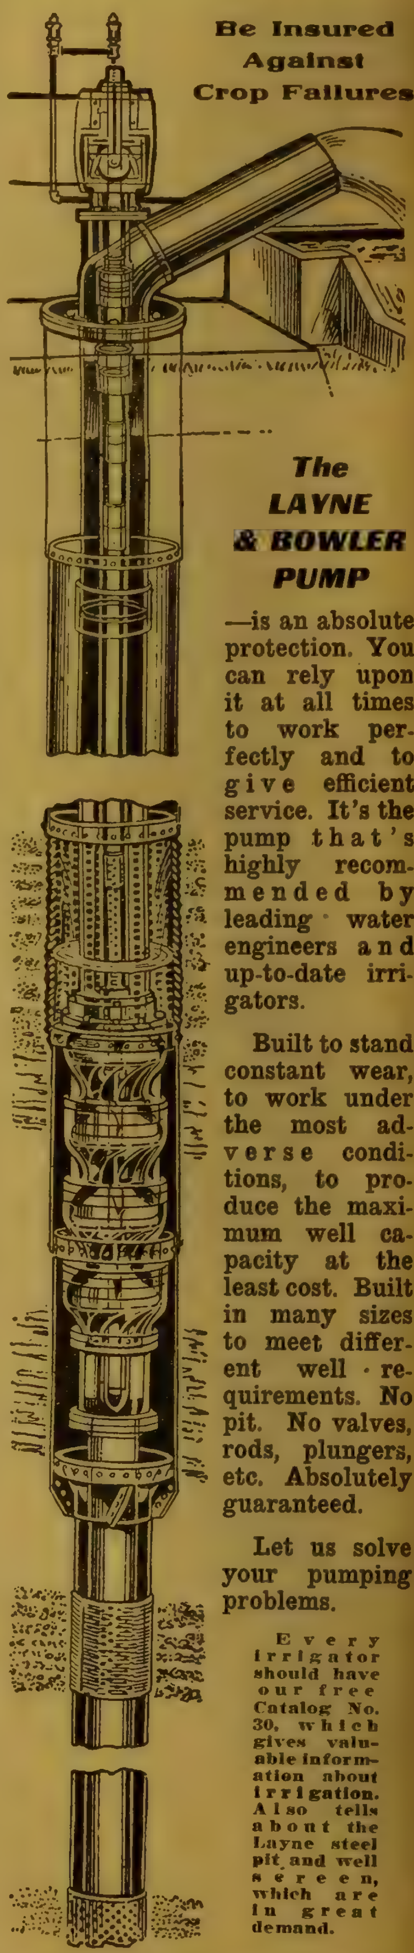
To know his machine, its various elements and their respective uses, the amount of work and strain to which each can be put without injury, is essential to the car owner. When troubles arise it is necessary to know how and where to locate them in order to make the quickest possible repairs and adjustments. A knowledge of the principle of carbureters and ignition is of great value to one who would properly and successfully run a gas engine. The carbureter troubles so frequently met with are mainly due to ignorance, inattention and carelessness rather than defective mechanism.

Keep Things Clean.

The collection of dirt is destructive to efficiency and economy as well. Care of the fuel, cooling and ignition system is of significant value. Here, as elsewhere, "knowledge is power," and the successful operator has informed himself along the lines indicated. He knows the necessary conditions of working and control, as well as how to meet the many mishaps and disorders which in the course of time every auto owner will encounter.

Care in Driving.

To go to town in the busy season for repairs, provisions, etc., and get back "in a jiffy," is all very well, but unless it be a life and death matter, don't speed. It is a senseless, insane practice which finds no excuse. It shortens the life of the tires and subjects the whole car to a needless strain. If often shortens human life as well. The highest degree of efficiency may be attained by driver and car as well, if sane methods are employed. A steady hand guided by an intelligent brain are the prime requisites. The farmer, accustomed to the care and operation of machines, makes a good driver.



An Adequate and Dependable Water Supply is Essential FOR SUCCESSFUL FARMING

Be Insured Against Crop Failures

The LAYNE & BOWLER PUMP

—is an absolute protection. You can rely upon it at all times to work perfectly and to give efficient service. It's the pump that's highly recommended by leading water engineers and up-to-date irrigators.

Built to stand constant wear, to work under the most adverse conditions, to produce the maximum well capacity at the least cost. Built in many sizes to meet different well requirements. No pit. No valves, rods, plungers, etc. Absolutely guaranteed.

Let us solve your pumping problems.

Every irrigator should have our free Catalog No. 30, which gives valuable information about irrigation. Also tells about the Layne steel pit and well screen, which are in great demand.

Layne & Bowler Corp.
900-910 SANTA FE AVE.
LOS ANGELES, CAL.

Who shows mercy to his beast will show mercy to his car." The careful, merciful horseman knows the commercial value of judicious driving and governs himself accordingly with results satisfactory to all concerned.

Care of Tires.

As the greatest single item of expense is the tire I will conclude this article with a few "Don'ts on Tires." If heeded the item of tire expense will be greatly reduced.

Don't speed.

Don't apply the brake suddenly unless absolutely necessary. Use the throttle more and the brakes less in controlling the car. This saves both the tires and the machine.

Don't allow grease and oils to come in contact with the tires. They destroy the rubber. So does rust. Paint, on the contrary, preserves it.

Don't allow the weight of the car to rest on deflated tires even when not in use.

Don't allow the side of the tire which shows more wear than the other to remain in the same position. Reverse the sides to insure even wear.

Don't ever run on a flat tire. If absolutely necessary and the distance is short, run on the rim.

Don't fail to transpose the rear and front tires when necessary, as the front tires wear less than the rear ones.

Don't be afraid to burst a tire by too much inflation. A tire, unless old or injured, is seldom over-inflated. The reverse is more often the case and does great injury.

Don't allow stored tires to get damp. It breaks down the fabric and weakens the shoe.

Don't allow blisters to form on the tire. Make prompt repairs.

Don't allow your front wheels to slide in a sidewise direction involving great wear on the treads. See that they are parallel.

High and steady temperature as well as strong steady light are destructive to rubber. Keep your auto when not in use, in a place where the tires are not thus tested.

Don't overload your automobile and see that the rims are straight and true.
—Farm Stock and Home.

GAS ENGINE SIMPLICITY.

Probably no other device invented for farm use, next to the self-binding harvester, has done so much to take the burden of labor from the farmer's shoulders as the gasoline engine. There are in use today approximately 7,000,000 gas engines in this country, and the number is growing rapidly. The gas engine, as built today, presents no obstacle to the man who can operate other farm implements. It is adjusted to run properly when it leaves the factory and ordinary care will keep it so. Trouble only comes when the engine is neglected, left outdoors, exposed to rust and ruin, not oiled, or abused in similar ways.

The engine which is today considered the most efficient and reliable is the four-cycle engine. Its main parts are the cylinder, piston, base, crankshaft and fly wheel. To study the simplicity of the gas engine you will note that the space in the cylinder between the head end and the head of the piston is what is known as the combustion chamber, and in operation there are four cycles or strokes for each explosion.

Starting with the piston at the head end of the cylinder, the piston then moves outward. This movement outward opens the admission valve, and the mixture of gasoline and air is sucked into the cylinder. This is termed the suction stroke. The cylinder being full of explosive gas and the valves being now closed this gas is compressed as the piston moves in toward the head end of the cylinder, and just before the piston reaches the extreme end of this stroke, a spark takes place in the combustion chamber and the gas is ignited, making the compression stroke.

The explosion occurs just as the piston begins its outward movement. The force of the explosion against the head end of the piston drives the piston outward. Hence, this is called the tower stroke and when the piston is at the end of this stroke the cylinder is full of burnt gas.

The exhaust valve is then opened and when the piston moves toward the head this burnt gas is driven out through the exhaust valve, making the exhaust stroke. When the piston reaches the head end, the exhaust valve is closed and the engine is ready to again take up the first stroke.

This series of four strokes constitutes a complete cycle and produces one explosion, hence the name "four cycle" which is applied to engines operating on this principle.

The hit and miss governor, which is used on most four-cycle farm engines, is a device arranged in such a way that the speed of the engine is automatically maintained by controlling the number of explosions; that is, the engine takes an explosion only when needed to maintain the speed. Thus if the engine is running a machine requiring but little power the engine will take an explosion and run along for some time before another explosion takes place, but if the engine is pulling a heavy load rapid successive explosions occur.

The several systems used in cooling gasoline engines are air, running water and hopper cooling. In the hopper cooled, the cylinder is surrounded by a jacket which is kept full of water. Large water ways are provided between the outside of the cylinder wall and the jacket to insure good circulation and perfect cooling. Like a tea kettle, so long as you keep the hopper full of water there is no danger of overheating the engine. In cold weather the water in the hopper can be drained and in the morning hot water put in. This hot water warms the cylinder walls and makes it very easy to start the engine. If it is not convenient to drain the hopper then use calcium chloride, as this will prevent the freezing of the cooling water.
—Farmers' Review.

THE SIX RULES FOR FIRE PREVENTION

1—Matches

Be sure your match is out. Break it in two before you throw it away.

2—Tobacco

Throw pipe ashes and cigar or cigarette stumps in the dust of the road, and stamp or pinch out the fire before leaving them. Don't throw them into brush, leaves or needles.

3—Making Camp

Build a small camp fire. Build it in the open, not against a tree or log or near brush. Scrape away the trash from all around it.

4—Leaving Camp

Never leave a camp fire, even for a short time, without quenching it with water and then covering it with earth. See 1914 Hunting License.

5—Bonfires

Never build bonfires in windy weather or where there is the slightest danger of their escaping from control. Don't make them larger than you need.

6—Fighting Fires

If you find a fire, try to put it out If you can't, get word of it to the nearest U. S. forest ranger or state fire warden at once. Keep in touch with the rangers.—U. S. Department of Agriculture forest service.

Fashions change, and changing conditions bring changes in farming methods the same as in everything else. On the old Glenn ranch, which is now a part of the Jacinto unit of the Sacramento valley irrigation project in Glenn County, some of the largest capacity combined harvesters ever operated were developed. They were the symbol of the most extensive form of farming ever known in California. Now grain that has been grown on the same land is being harvested with small self-binders and will be threshed with small threshing machines. There are now 50 or more families, with schools, churches, societies and all of the things that go with a successful farming community on the same area that was at one time handled from a single "camp" that was a scene of great activity at plowing, seeding and harvest time time only.

You can't always tell how much mind a man has from the length of time it takes him to make it up.

A PROBLEM

The problems of a certain Sacramento Valley farmer at this time may be of interest to others—and it is possible that some of our readers may be able to make helpful suggestions.

Our friend has a good irrigated 40-acre farm and is farming some land on shares beside. He has planted considerable orchard, and is caring for it well, so that his prospects for the future are good—if he ever gets to that future without going broke. He has made some payments on his place, and has passed the stage that some newcomers find themselves in when they cannot raise feed enough for their stock. He understands farming—and more than that understands farming under California conditions. He will have an abundance of feed, grain and hay, this fall. If feed prices were high he would be able to sell and make enough to meet his payments and other obligations. At present prices the margin he would receive above labor bills would be very small.

Now what he feels that he needs to do is to provide storage room for all of this feed and later buy stock and feed it, in the belief that he can in this way get $6 or $8 or perhaps $10 or more per ton for his hay—and better than present grain prices for his barley.

Now his fear is that should he be able to borrow the money to provide barns for storage—when and how will he be able to pay this back? And if he gets the feed stored where will he be able to buy stock to feed at prices that will make him a profit?

Here is a rural finance problem that we will be glad to have discussed.

SOME CORN

The July crop report issued by the bureau of crop estimates shows forecasts of 2,390,000 bushels of corn for California. The average for the past five years, that is, 1909-13 inclusive, was 1,745,000 bushels. The average per acre in California is materially above that of the Middle West or the corn states but, of course, production costs more in California because of the necessity for irrigation. The estimate for the entire United States, expressed in bushels, is 2,920,000,000, while the average production for the past five years was 2,708,334,000. So not only in California, but the country over, a substantial increase is to be noted. If these forecasts are correct another step will be taken towards discouraging financial stringency.

HIGHWAY BULLETIN.

The state highway commission is issuing a quarterly highway bulletin. There are many questions of interest to the public which this highway bulletin will answer, and we understand a copy will be mailed to any taxpayer who will write to its editor, Rialto Building, San Francisco.

PEANUTS IN KINGS

We note in a dispatch from Hanford that peanut buyers are signing with farmers of that section to grow peanuts. Possibly conditions in Kings County are such that peanut growers can make their salt, but we think they will do well to plant lightly until they have tested the matter. With Japanese competition, American peanut producers of the southern part of the state have practically entirely gone out of the business.

POTATO MOTH.

California is producing some of the finest potatoes in the world. Many other sections are asking for these potatoes, and, as for many years, hundreds of carloads are being shipped out. The situation has been seriously complicated this year by the tuber moth, not that this is the first year it has existed, for it has been in the state a score of years, and many think that it is not only in this state but in many others, some of which have now quarantined against California potatoes. Be that as it may, the quarantine has been laid, and it is feared it may be laid by other states. In order to prevent this, state and county commissioners are using every effort to see that only perfect potatoes are shipped out. Inspection is now made of every car going out of the state.

HORTICULTURAL SOCIETY

Why is it that the greatest horticultural state has no general organization of its horticultural interests? This question is asked frequently, though not so often in more recent years as it was 10 or a dozen years ago. The answer usually given is that the state horticultural commission has conducted gatherings which have given opportunity to the horticultural interests to enter into discussions which have influenced legislation and to a degree protected horticultural interests. This has also been true of some farmers' clubs, which while organized locally have had a state wide influence. But is there not opportunity for usefulness for a regularly formed organization?

When the matter has been suggested in the past the statement has been made that as the state horticultural commission conducts these meetings, bearing all of the expense and in addition issues a report containing all of the discussions and addresses, there is no necessity for the growers to take unto themselves this expense. But for the past few years Horticultural Commissioner Cook has acted under the belief—and we believe correctly—that the principal mission of his office is policing and attending to quarantine measures which affect fruit and productive interests generally. This is the one duty before the commission; there is no other body in the state to enforce our horticultural laws. The responsibilities along this line have greatly increased during the past few years and now require the united energies of a large field and office force. Investigational matters have been turned over almost entirely to the state university, and this is as it should be, for its equipment is perfect, or becoming perfect, along these lines.

Under these considerations has not the time arrived when there should be a great growers' organization which may draw upon both these and other interests for help in protecting the fruit industry and yet represent it in legislative and other general matters? Especially may we not call attention to legislative matters. There should be some organization on watch. The state commission and the state university are, of course, a power in this line, but neither of their interests are so general as would be those of a larger organization, including all factors of horticultural work.

It may be said that any action of the state fruit growers' convention, which usually meets semi-annually, represents the larger fruit growers interests. But while this gathering has at times used the words, "State Fruit Growers' Association," it has done so without authority, for there is no such association; any one who has chosen to attend the conventions has been a "member," or at least a voter, and on certain occasions in the past these "voters' have not represented fruit interests. There are no dues and no officers other than that the state horticultural commissioner is ex-officio director and his secretary has acted as secretary of the convention.

New York and several other fruit growing states have powerful organizations of horticulturists. The annual dues are one dollar, or simply nominal, and for that the annual report is sent to each member. Other dues are received from life members. The reports have become classics as to horticultural matters in the states in which the societies exist. These societies are representative of the growers only and give a feeling of "ownership" and of interest which a state-controlled body cannot.

As noted, the California horticultural commission has issued reports of meetings until the last two sessions, and Dr. Cook has announced that he will also be unable to issue a report of the coming convention to be held in Los Angeles. In addition the policing or quarantine work has been such a drain upon the funds of the state commission that it is now unable to bear the expenses attendant upon the ordinary convention. The expenses of the last convention were borne by the supervisors of Yolo County; the expenses of the coming convention will be assumed by Los Angeles County and City. This saves to the state horticultural commission more funds and enables more thorough quarantine work, but is it fair to communities which may be unable to pay out sufficient money to secure a meeting of the fruit growers, yet perhaps need the inspiration of a great state meeting? Of course to the two counties mentioned it has been no burden.

In addition, we may say that there is a legislative committee representing fruit and agricultural interests generally, which is discussing the introduction at the coming session of the state legislature of a measure which will unite the state horticultural commission, the state agricultural society, in fact all the state activities which have to do with agriculture, under one organization with one directing head. If such a measure should go through it will be added reason for serious discussion among horticulturists as to how best their interests may be looked after.

These are merely hints which may open the way for a discussion which could profitably be taken up at the coming Los Angeles convention. Is there not need for a great California Fruit Growers' Association?

Agricultural News Notes

Dairying is being rapidly developed in India.

Fruit canning is becoming popular in South Africa, especially Natal, which is creating a good market for canning outfits.

The United States consul at Valparaiso states that fairly good riding horses in Chile sell as high as $100 United States gold, and the poorer grades as low as $40. Coach horses are valued at $100 to $200.

The total receipts of cattle at the principal markets is considerably less than one year ago. It is apparent that people are eating less meat, but there is nothing to indicate that meat prices will ever be much lower than at present.

The seaweed industry is an important one at Havre on the coast of France. Many varieties are gathered. They are used green or dry for fertilizer, for the extraction of iodine and potash, as filling for mattresses and for packing.

An international meteorological congress, under the patronage of King Victor Emanuel of Italy, will be held in Venice on September 17, 18 and 19, 1914. The object is to assemble students of meteorology of the world to study and discuss all phases of the subject. Communication and discussions will be made in French, English, Italian and German.

The improvement of Philippine citrus fruits has been accorded special attention by the department of agriculture. Some 65 named varieties of citrus fruits, including oranges, mandarins, pomelos, lemons, limes and citrons have been imported from the citrus growing regions abroad, and these are also being propagated at the Lamao experiment station for distribution to Philippine planters.

The orange crop of the present season in the Valencia district of Spain is estimated to have been short some 150,000 cases, though these figures are somewhat more favorable than was expected at the time of the abnormal cold snap in January of this year. What is perhaps more important in relation to the crop is that many thousands of cases of inferior fruit, sold probably at prices lower than those which usually rule, have been sent out.

A concerted effort, backed by the government of the Philippines, is being made to substitute corn for rice as an article of diet among the people of the islands, the bureau of education being engaged in a campaign of teaching the people how to grow and use this cereal. As a result, during the last two years, there has been a marked increase in the production of corn. In 1913 the crop was estimated at 15,000,000 bushels, with a value of $12,300,000.

What is stated to be the largest transmitting station in the world has recently been completed at Cefndu, near Carnarvon, Wales, and will be formally opened within a few weeks. When the station is opened direct wireless communication will be established between the United Kingdom and the United States. Hitherto a marconigram handed in at London had first to be sent by land line to Clifden on the west coast of Ireland; thence it was transmitted to Glace Bay, Newfoundland, whence it was sent to the United States by land line. The new station will communicate direct with the station in New Jersey, just outside of New York.

Agricultural News Notes of the Pacific Coast

Northern California

Sonoma County blackberry growers dry many of their berries.

A number of students are still taking work at the university farm at Davis.

The Corning Olive Growers' Association now has its own packing house.

The tentative date for the Sebastopol Gravenstein Apple Show is August 10.

Thirty cars of pears, plums and apples left Sacramento the night of July 7.

About 1000 acres of land have been planted to beans this year in the "basin" near Arbuckle County.

Farm Adviser Lyons of San Joaquin County met the farmers at Lodi and discussed the alkali problem.

Corning olive growers state that their crop this year will probably exceed last year's by at least one-third.

A model dairy is to be installed at the state hospital at Stockton. Purebred Holsteins will be purchased for the dairy.

A new feature at the Ferndale fair will be Automobile Day on September 10. The fair will be held from the 7th to the 11th.

A special class has been formed at the state fair for boys' pig clubs, cash prizes and ribbon awards being offered as in other live stock classes.

The Colusa County Swine Breeders' Association has formulated plans to induce swine breeders of other parts of the state to organize similar associations.

Early peaches shipped from Lodi are reported as bringing very satisfactory prices, because they have the early peach market practically to themselves.

The board of directors of the Sonoma and Linne Counties' District Fair has determined to offer $3000 in cash prizes for live stock at the coming fall fair.

A duly organized farmers' protective league reports that farmers all over the state are enrolling as members to take part in the fight against the eight-hour bill.

Complaint has been made to the interstate commerce commission that the railroads are charging excessive rates on fruits from California points to Seattle and Vancouver.

The newly organized Feather River Highway Association has started an active campaign for better roads in Northeastern California and has arranged to have all principal roads marked for the benefit of travelers.

The report of the California Fruit Distributors on June 29th showed the following carload shipments of green fruit: Cherries 166, apricots 374, peaches 255, plums 797, pears 34. The total is almost double the shipment of 1913.

At the recent meeting in San Francisco of the California Live Stock Breeders' Association it was decided to open offices of the association and establish a salaried secretary in charge. The association also endorsed the work of the farmers' protective league, which was recently organized to lead the fight against the eight-hour bill.

Central California

The beet sugar factory at Visalia is reported in readiness for slicing.

Canneries of Dinuba have contracted for most of the peach crop.

The agricultural fair opens at Salinas, Monterey County, August 1st.

In connection with Fresno's county fair will be held horse, dog and poultry shows.

A general fair is being agitated for Tulare County instead of the usual citrus fair.

La Honda, San Mateo County, is becoming known as a cheese manufacturing center.

The Alta district of Tulare County shipped out 40 carloads of melons on one day last week.

The heat of the past few days has ripened peaches so fast that there will be many small sizes.

The county supervisors of Madera have appropriated sufficient funds to secure a farm adviser.

The Fresno district fair will be held September 29 to October 3. The floral exhibit will be held the first two days of the fair.

The Turlock cannery has put up 25,000 cases of apricots, a record pack for that concern. The peach pack will begin about July 20th.

The San Jose grange was addressed at its recent meeting by Dr. Leroy Anderson on irrigation systems and dairies along the Sacramento River.

The producers' association formed by farmers at Patterson, Stanislaus County, has taken on new life and a campaign is being made for new members.

A strong branch of the farmers' protective league has been formed in Tulare County. W. Sims of Farmersville has been chosen president of the county association.

The Porterville Citrus Association has chosen the following directors for the ensuing year: H. C. Carr, F. D. Bailey, W. P. Bartlett, V. D. Hutcheson, John Orr, H. F. Brey and W. E. Sprott.

The California Associated Raisin Company states that during the month of May, 1905 tons of raisins were shipped from the state, as compared with 903 tons during the same month last year.

The new building of the Madera Cooperative Creamery Association is practically completed and it is thought it will be ready for work by July 20th. It will be able to care for milk of 5000 cows.

A mass meeting was held at Lindsay, Tulare County, last Saturday to take preliminary steps toward the formation of cooperative associations of growers throughout the county to cheapen and facilitate the fumigating of citrus trees to eradicate soft brown scale.

The recent Holt Manufacturing Company picnic, held near Stockton, called out an attendance of almost 4000 people. The festivities were started with a great parade through the streets of Stockton of nearly 700 workmen from the manufactory, with 27 automobiles and tractors, including one 75-horsepower and another, the baby of all Caterpillars.

Southern California

Santa Ana's sugar factory begins slicing July 20th.

The old lima bean growers' association has been formally dissolved.

Neighbours, in the Palo Verde Valley, is assured a new cotton gin.

Pony refrigerators of ripe Calimyrna figs are being sent east from Indio.

The Ventura County Fair Association has arranged its program for the next fair.

The Hog Raisers' Association of Imperial Valley met in El Centro Saturday, July 11th.

Ventura County bean growers are glad of a change to warm weather because of the beneficial effect on the crop.

A walnut crop of 10,529 tons is the estimate of the California Walnut Growers' Association for the 1914 output.

Grape growers of Heber, Imperial County, say that they will have a bigber yield than ever before from their vines.

The Santa Fe railway estimates the output of fruit canneries in California this season at between 15,000,000 and 20,000,000.

The California Fruit Growers' Exchange has begun a nation-wide campaign of advertising of the Sunkist and Redball brands.

Citrus growers of Bloomington, San Bernardino County, recently met in mass meeting to inaugurate a campaign against black scale.

The Covina Valley Farmers' Club held its last summer meeting the last Saturday in June. No gatherings will be held during July and August.

So far this season the Pomona Fruit Growers' Exchange has paid out to members $550,000. There are yet about 60 cars of oranges to be shipped.

Orange packers of Orange County met at Anaheim last Saturday to arrange for the disposal of cull oranges so that they may be kept off the local markets where they are in direct competition with better grades.

The Portland and Seattle markets want their cantaloupes without paper wrappers. In damp weather the paper-wrapped melons are the first to show decay. Better prices are paid for the unwrapped product.

According to the figures of the Coachella Valley Date Growers' Association over 5000 date offshoots have been imported this season. A few of these went to Arizona, but most of them were planted in the Coachella Valley.

The sugar refineries of Southern California have inaugurated a campeign of education to demonstrate to housewives that beet sugar is as good for all purposes as cane sugar. The product is to be henceforth known not as "beet sugar," but "Southern California sugar."

Up to date there have been issued under the new automobile license law in California over 104,000 licenses. This places California next to New York in number of cars, the latter state having about 122,000, but California stands first in per capita automobiles. California has one automobile to each 23 persons, while New York has one to every 74.

The Coast

Cantaloupes of the Salt River Valley of Arizona cover 2000 acres.

Arizona's state fair will be held during the week of November 9-14.

The Portland, Oregon, market reports the price of hogs as falling off five cents.

Over 471,000 head of live stock were inspected by the Live Stock Sanitary Board of Arizona during 1913.

Odessa, Washington, has a new creamery. It has sufficient capacity to care for cream from 600 cows.

The fruit exchange at Kennewick, Washington, has received $10,000 for this season's shipments of cherries.

Alfalfa growers in the country about Methow, Washington, are happy over getting up their first crop without rain.

Over 65,000 acres of grazing land in Alberta, Canada, has been leased by a Montreal company for breeding cavalry remounts.

Bounties offered by the live stock sanitary board and state veterinary board have been declared illegal by the supreme court of Idaho.

The creamery at Eugene, Oregon, has become the property of the Farmers' Creamery Company, a cooperative association composed of 200 dairymen.

The Walla Walla Valley Swine and Cattle Breeders' Association will hold its first annual swine sale at the Walla Walla County fair grounds September 16.

Experiments in growing sugar cane have been successful in the Salt River Valley of Arizona. The factory at Glendale has installed machinery for crushing cane.

The Wenatchee Valley Fruit Growers' Association of Washington is offering cash for green deciduous fruit. The association takes orders from buyers and guarantees quality of fruit delivered.

Following is the latest estimate of Yakima Valley tonnage for 1914: Cherries, 24 cars; apricots, 11; prunes, 120; peaches, 1112; pears, 475; grapes, 35; melons and cants, 300; apples, 5950; mixed cars, 600. Total, 8627.

The Senate has approved expenditure of $200,000 for starting work on the Wapato irrigation project on the Yakima Indian reservation. This assures placing water on 60,000 acres and providing storage supply for another 60,000.

Fruit and vegetable growers of Washington, Oregon, Idaho and Montana will meet in a by-products convention at Portland, Oregon, September 10. At this time they will listen to a report of the cooperative by-products committee of the National Apple Show Association.

The first apples of the 1914 season grown in the Northwest reached Spokane from the Kennewick district. There were 50 boxes in the consignment, which was made up entirely of Yellow Transparents. They were shipped in small peach boxes, yet realized from 75 cents to $1 a box, a record price for the quantity. They were sold through the North Pacific Fruit Distributors.

LARROWE'S
DRIED BEET PULP
TRADE MARK REG U. S. PAT OFF

Nature's Gift
to Dairymen

A TRULY WONDERFUL FEED

Larrowe's Dried Beet Pulp is the pure shredded root of the sugar beet, with only the sugar and water extracted; dried, sacked and ready for shipment in one hour from the time the beets enter the factory. It is clean, healthful, succulent, and cannot ferment or sour if kept in a dry place.

Larrowe's Dried Beet Pulp improves the health and increases the flow of milk. It furnishes more succulence than silage, greater digestibility, an abundance of carbohydrates—and is just what is needed with alfalfa to make a perfectly balanced ration.

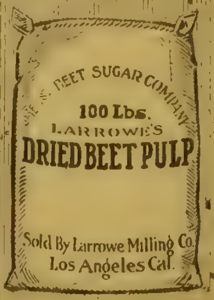
Larrowe's Dried Beet Pulp is uniform in color; never blackened or burned. It is light and bulky; swells to about six times its original bulk when moistened. Cattle take to it ravenously.

Order a sack from your feed dealer today and try feeding it to one cow whose milk record you know—and watch results.

Write for booklet—"Profitable Feeding," with feeding instructions and information.

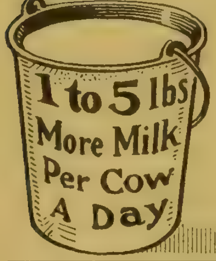
The Larrowe Milling Co.
607-608 Central Building, Los Angeles, Cal.

Prove its Worth With One Sack



BEET SUGAR COMPANY
100 Lbs.
LARROWE'S
DRIED BEET PULP
Sold By Larrowe Milling Co.
Los Angeles Cal.

ORDER FROM YOUR DEALER NOW



Larrowe's MOLASSES-Dried Beet Pulp is preferred by many feeders on account of its sweetness. Just the plain beet pulp with beet molasses dried. Splendid for fattening; also for horses.

You Wouldn't Put Axle Grease on Your Watch

Isn't it almost as ridiculous to use ordinary farm oil on your cream separator? It's delicate mechanism demands a special oil. We make good harvester and gas engine oils, but we do not recommend them for separators. If your separator is to do its best work, you must lubricate it with

Standard Hand Separator Oil

It is made especially to suit the peculiar mechanism of cream separators. It is of just the right body. It does not "gum." It keeps the bowl running swiftly and smoothly—you get *all* the cream. There is no better oil—regardless of price. Dealers everywhere.

Standard Oil Company
(California)

PRACTICAL MILK HOUSES

(Continued from page 51.)

Fig. 2 shows a milk house in Imperial valley, constructed to meet the needs of that rigorous climate. This is about 8x12 feet in size and 8 feet in the clear. It is set up from the ground about two feet for two reasons as explained by the dairyman. He believes the interior can be kept cooler by having the free passage of air underneath and the floor kept drier and more free from odors. The floor is of concrete laid four inches thick on boards and joist. He says the elevation gives better drainage—the waste being carried in a pipe beneath the ground to a covered cesspool in the porous soil some distance to the right. The house is well ventilated and well screened.

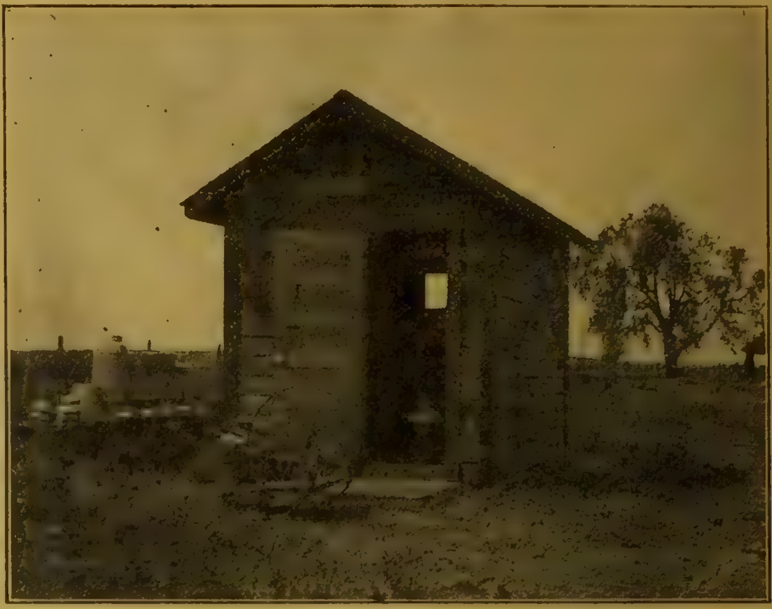


Fig. 1

The water in the foreground is a typical Imperial valley "well." An excavation of convenient size and depth is made with team and scraper. Water from a near-by irrigation ditch is turned in to fill the "well." After standing a few hours, much of the Colorado river sediment has settled to the bottom, and then the galvanized iron tank is filled by means of pumping. Again the water is permitted to settle when it is drawn off for use in the dairy, in the house or for stock.

Figs. 3 and 4 are photos of two milk houses, the former near Gridley, Butte County, and the latter near Willows, Glenn County. There are larger and more expensive than the first two illustrated. I did not see the owners to obtain cost, but would estimate Fig. 3 to cost about $150 and Fig. 4 $300 or more. The Gridley house is not ceiled inside, while the Willows house has a thick double wall, giving an ample air space. It is also ceiled overhead and painted inside and out. In the end to the reader's left is a room with insulated walls, to be used for ice, as the owner plans to make butter at some future date. The smokestack is from a two-horse power boiler used to provide steam for cleaning purposes. The fuel is coal.

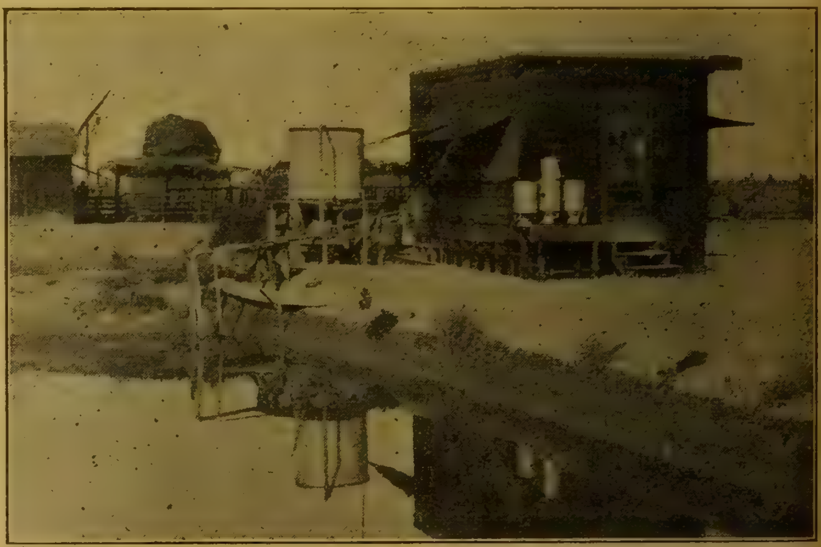

Fig. 2

Ventilation is very important in the milk house, especially in the interior of the state where the summers are very warm. The houses which are open and screened on four sides seem to be best arranged and more free from odors. In a milk house in the Los Molinos district I found the owner using burlap instead of wire screen and it was giving good service. The burlap admits light and air and excludes flies and more dust than wire screen. The room was clean and free from odors and I see no objection to burlap screen when one has not the money for wire screen. Clean barley sacks answer the purpose and furnished the screening at this place.

Equipment.

The equipment of the milk house is simple. If cream is sold there must be a separator of such capacity as the size of the herd demands, also a vat for receiving the milk, elevated enough to allow the milk to run into the separator. If the separator is operated by hand the vat needs to be large enough to hold an entire milking, for usually it is the milker, or one of the milkers, who furnishes the power. If, however, the milk is brought from the dairy in cans instead of in buckets as milked, then the vat need not be so large. And there must be a wash sink for rinsing and washing cans and buckets. Galvanized iron sinks standing on iron legs are best and most sanitary. The milk receiving vat may be supported in a similar way. Dairy supply houses give illustrations and prices of all such.

The cream must be cooled to as low a temperature as possible, as it comes from the separator. There are many devices for this, but I have seen no cooler better than one devised by John Guill, Jr., of Chico and made under his direction by a local tinsmith. Fig. 5 shows its construction. One great advantage of this cooler is that it is short in length, thus requiring little room, the total length being only 13½ inches. Yet the cream from the separator spout to the can travels four feet over a cold water jacket, which brings the cream very nearly to

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. When writing advertisers, mention Cultivator

the water temperature. The water intake is by a three-fourths inch hose connection, and the outlet, a three-eighths inch tube (brass), insures a constant supply of water inside. The water jacket underneath is divided through the center lengthwise as shown by the dotted line in the top view so that the water must flow the entire length of the cooler. The extension of the cream space at the outlet is convenient for resting the cooler on the cream can and insuring it against slipping. The cream outlet is indicated, but shown only by dotted line, as neither view allows the full opening to show. The divisions in the cream space are four inches long by five-eighths inch high and the open space at the end of each four-inch division is three-eighths inch. The whole cooler is made of heavy tin, except the water intake and outlet, which are of brass.

The usual provision for keeping cream cool up to the time of shipment is to set the cans in cold water. Where there are only one or two cans, many use any ordinary tub, but for more cans a special water tank is better. One dairyman, just beginning operations near Willows, built a concrete trough in his milk room, which is the first story of the tank house. He has arranged a water circulation direct from the pump, while the overflow goes to the garden for irrigating.

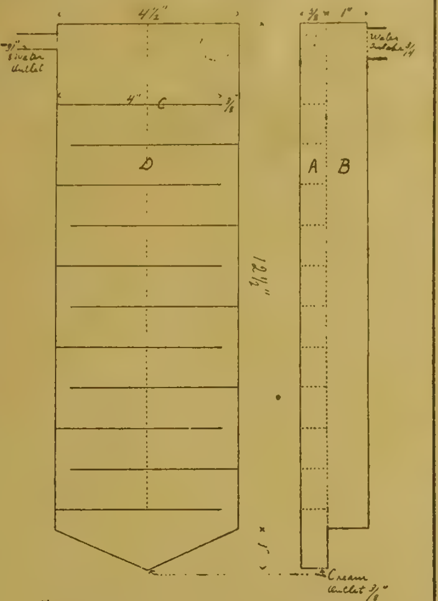

Fig 5 Top and side view of cream cooler
A Cream space divided by tin partitions C
B Water jacket divided through center 'D'

Fig. 5

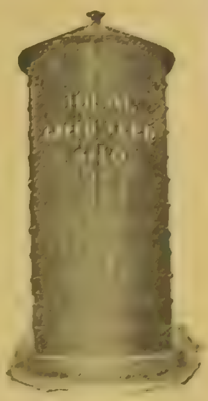
Moral—Make the water do all the work you can.

If milk is sold, it must be cooled as soon as possible after milking. This means a cooler, and probably the coil coolers having a stream of water continually pouring through them are best. The cooler is placed alongside the wall, high enough to allow the milk to flow from it into the proper cans, vat or bottle filler. Above the cooler must be a receiving vat in addition to the distributor attached to the cooler. It is well to arrange for milkers to pour the milk into this vat from outside the room or building. The strainer is placed outside with a long spout running through the wall to the receiving vat. The milker ascends to the elevation by means of a few steps surmounted by a platform about a yard square. Such an arrangement keeps much dirt and many flies out of the milk room.

Providing hot water and steam for cleansing on a small dairy is a problem. Some use a coal oil stove, but this is smelly and unsatisfactory. Speaking of stoves, the vapor stove burning engine distillate is the most satisfactory one I have yet used outside of gas. A small boiler is mighty convenient. One of three-horse power furnishes enough steam to run a turbine separator of the smaller sizes and to do all the washing or cleaning. The boiler may be heated with wood, oil or distillate at the convenience of the dairyman. If a boiler is installed, a separate room is essential, but it may be very small and adjoin the milk room.

I have said nothing about the Babcock milk tester as a part of the milk house equipment because the up-to-date dairyman is going to be a member of a cow testing association and have his cows tested regularly by a man hired for that purpose.

What Does a Silo Cost?



AN IDEAL GREEN FEED SILO will pay for itself the first year. That being the case, it will cost you nothing.

AS A MATTER OF FACT, THE COST of a silo is really a secondary consideration, because if you are keeping dairy cows or raising stock for the market, there is no investment which you can make which will pay you better returns than an **Ideal Green Feed Silo.**

A GOOD SILO IS A NECESSARY PART of the dairy equipment of every cow owner or stock raiser who wants to realize a reasonable profit from his herd, and if the matter of cost has been standing in your way, please remember that it is really not a question of whether you can afford to erect a silo, but whether you can afford to do without one.

IF YOU HAVE NO SILO, A LITTLE investigation will be sure to convince you that you ought to purchase one right away.

THE SHREWDEST AND BEST POSTED ranchers in Pacific Coast States are buying **Ideal Green Feed Silos.**

Write for new Silo Folder A for full information.

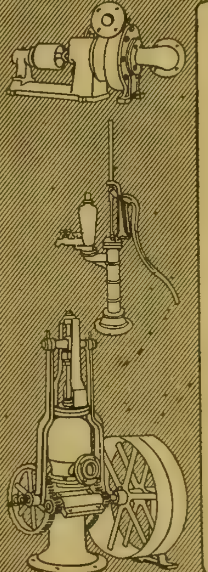
PACIFIC COAST AGENTS FOR JAMES BARN EQUIPMENT

PUMPS



Whatever kind of a pump you need—we have it. Handling all styles of pumps we are not obliged to urge any one type on you, but are in a position to help you select the pump best adapted to your particular requirements. We manufacture and sell

Horizontal Centrifugal Pumps
Vertical Centrifugal Pumps
Deep Well Pumps, Power Heads
Windmill Pumps, House Pumps

Illustrated are three of the many different styles. Don't decide on a pump till you put your needs up to our Pump Specialists. Their advice and suggestions will cost you nothing.
WRITE TO US and state your requirements—by guiding you to a right selection we can probably save you both money and trouble.
FREE CATALOG 28-B describes Bean Horizontal and Vertical Centrifugal Pumps.
FREE CATALOG 28-D describes all other pumps; also Bean Distillate Engines.
A postal will bring either or both by return mail.

BEAN SPRAY PUMP CO.
212 West Julian St. San Jose, Cal.

Kelsey Tubular Cooler

Kelsey Copper Tubular Coolers are made in all capacities. Efficient, sanitary and very durable.

The Kelsey Copper Cooler has a capacity of 35 gallons per hour and will cool milk within 1 degree of the temperature of the water.

Books

This list of helpful, instructive and interesting books is prepared by us with the purpose of enabling the Cultivator readers to supply themselves at the lowest possible cost. The great value of many of these is so well known as to need no comment from us. Some of the new books which we have added to the list this year deserve special mention. "Co-Operation in Agriculture," by G. Harold Powell, should be in the hands of every producer of farm products. "Farm Sewage," by Santee, will aid many in solving a perplexing problem. "Farm Manures," by Thorne, is decidedly valuable. We state sincerely that no orchardist can afford to get along without "The Pruning Book," by Bailey. We have had much inquiry for a book on keeping farm accounts—we can supply a good one now. The imported book, "Insecticides, Fungicides and Weedkillers," by Bourcart, is a marvel of completeness. The rapidly increasing use of gasoline engines, automobiles and tractors by the farmers has demanded reliable treatises on these subjects. "The Gasoline Engine on the Farm," by Putnam, "The Modern Gasoline Automobile," by Page, and "Traction Farming and Traction Engineering" are exceptionally complete, well illustrated and easily understood. Don't overlook the "Cement Workers' Handbook"—it's "worth its weight in gold." Every book on this list has the endorsement of the California Cultivator.

Irrigation and Forestry

FIRE PREVENTION.

Saturday, April 18th, was named by Governor Jonhson as fire prevention day. As one of the steps in making the day of more value to pupils in the public schools, State Forrester G. M. Homans issued a 12-page bulletin on Fire Prevention Day, A Lesson. It is a good lesson and should be learned by all the pupils of California. Those who did not learn of it in the public schools should write Forester Homans for a copy. This is the time of year when every precaution should be taken to prevent midsummer fires in forests, in fields, and even in the homes and farm buildings.

We quote one page of this bulletin giving some facts regarding California and the necessity for protection.

1. The total acreage of land surface in California is 99,898,880 acres. Texas is the only state larger than California.

2. There are approximately 20,604,000 acres of forest land in California.

3. There are nineteen national forests in the state representing a total area of 12,104,000 acres.

4. There are approximately 12,786,306 acres of merchantable forests in California.

5. There are 8,500,000 acres of these merchantable forests privately owned.

6. California has no state forests; several states have.

7. The forests outside the national reserves are very poorly protected from fire because California has failed to let the people make a law that is necessary.

8. Forest fires result in the loss of human life, public improvements, timber, little trees that would some day be big ones, game, homes, orchards, live stock, forage and plants from which bees get their honey:

9. The length of the fire danger season in California is from May 15th until October 15th. This means that everything is so dry during this period that fires will easily start unless every one is careful to prevent them.

10. The six rules which should be remembered are:

(1) Be sure your match is out before you throw it away.

(2) Knock out your pipe ashes or throw your cigar or cigarette stump where there is nothing to catch fire. Better yet—don't smoke.

(3) Don't build a camp fire any larger than is absolutely necessary. Never leave it even for a short time without putting it out with water or dirt.

(4) Don't build a camp fire against a log or tree. Build a small one where you can scrape away the needles, leaves or grass from all sides of it.

(5) Don't build bonfires. The wind may come up at any time and start a fire you can not control. Never play with matches.

(6) If you discover a fire, get word of it to the nearest state firewarden or forest officer or the land owner as quickly as you possibly can.

Learn and remember and practice these rules and you will be a valuable citizen.

11. California has not set aside a single dollar for forest protection. The United States government wants to help us but will not until our state does something to help herself.

12. Every one can help by urging that California as a state adopt a fire protection plan.

13. The state must pass the most suitable kind of forestry laws and provide enough money to work out the laws.

14. It is especially important to keep fire patrols in the woods during the summers.

15. During 1913 in California 61,812 acres of merchantable forests were burned over. This represents a money loss of approximately $124,059.

16. The total money loss occasioned by forest fires in 1913 in California, including damage done to houses, timber and pastures, amounted to $511,077. This amount of money is enough to pay for protecting the forests for several years and we have allowed it to go up in smoke.

GREAT SALT LAKE PRESERVES TIMBERS.

In replacing a railroad trestle recently burned along the north shore of Great Salt Lake, engineers have just found that the piles are still perfectly sound after 43 years of service. Looking for the cause, since these were only of local pine and fir, they found the timbers impregnated throughout with salt from the lake.

At another point on the lake, 18-inch piles, set 29 years, are similarly preserved with salt which has penetrated to their very center. Timbers in the Southern Pacific trestles across Salt Lake, placed in 1902, appear to be as good as on the day when the piles were driven. They have been preserved well above waterline by the salt dashed onto them by the waves, a fact apparently anticipated by the engineers who built the trestles.

The first transcontinental telegraph line, built before the railroad, extended west from Salt Lake City through the prosperous mining camps of Eureka, Austin and Virginia City. When the railroad was built, the telegraph line was transferred to follow its right of way and the old poles sawed off at the ground. An engineer who recently examined the butts left in the ground in the salt desert near Fish Springs found that although fifty years had passed since the poles were cut off the old butts were perfectly sound.

Telephone and electric companies in the Salt Lake Valley used the local salt for preserving poles. When set up, about 75 pounds of salt is placed around the pole in the ground. This method cannot be used, however, when the pole is on or near the lawn, or in any place where vegetation is desired.

It is pointed out that the reason why the waters of Salt Lake act as a strong preservative, as distinguished from ocean waters, is because the lake water is so much saltier—being practically a saturated solution. Preservation with salt is of no use in ocean piling against the attacks of teredos and other marine borers.

Experts in the forest service who have been investigating the preservative treatment of timber offer the suggestion that ties and poles which have been immersed for some time in the waters of the lake ought to be impervious to decay if the salt is not leached out by the action of the elements. It has been suggested that this can be guarded against, for example, by painting the butt of the pole with a coat of creosote which will keep out the moisture and keep in the salt.

And he gave it for his opinion, that whoever could make two ears of corn or two blades of grass to grow upon a spot of ground where only one grew before, would deserve better of mankind, and do more essential service to the country, than the whole race of politicians put together. — Dean Swift.

To be always fortunate and to pass through life with a soul that has never known sorrow is to be ignorant of one-half of nature.—Seneca.

The automobile has many uses on the farm. It is more than a pleasure car. It is a real implement that pays a dividend every year.

Turlock, Stanislaus County, has 3000 acres in melons this year.

Profit in the Poultry Yard

THE TRAGEDIES OF THE POULTRY YARD

So much is being written of the profits of poultry raising, is it not well occasionally to take the other aspect of the case? The little chicks that overeat or jump into water pails, or whose cruel mothers discard them and pick them to death?

The writer, following the slogan, "Back to the soil," has taken up ranch life with a vengeance, and the poultry yard is no small item.

One neighbor says, "Feed the little chicks on coarse, yellow Indian meal mixed as dry as possible with water or milk." Another expert says, "Never feed corn meal to either chicks or turkeys. It kills them."

Now, from my limited experience I think it at least does chickens no harm. I have had them grow and nourish on corn meal. But I believe it would kill turkeys—turkeys seem to have delicate stomachs while they are young—and when they grow up they still present their problems.

We hatched ten fine little turkeys from three turkeys and a gobbler that were hatched a year ago. After this first brood came off we set 30 more eggs, all of which proved infertile. Is there any reason for this?

To fill up the gap made by these failures I bought 25 little incubator turkeys and played mother to them myself for one week. My days were spent running about the alfalfa bed to keep them lively, and by night I would have the brightest, heartiest, little turks one would want to see; but the nights proved too much for the little birds, and one or two were dead every morning. Finally I induced one of the hen turkeys to mother the little orphans, and now the remaining dozen seem to be thriving fairly well.

My gobbler is getting bunches on his legs.

Can the Cultivator explain why these hard bunches of muscles appear? We have oiled them with vaseline, but with no apparent results.—J. M. P., San Fernando.

It is as hard to generalize about the feeding of chickens as about that of children. Some will thrive on anything, some are "thrown off their feed" by the slightest irregularity. Corn meal, mixed with water, was the chick feed of our grandmothers. The fact that some chicks have thriven upon it doesn't prove that it is a good ration. In our grandmothers' day chicks ran at large and balanced their own ration. Intensive poultry keeping has made more careful feeding necessary. Try the Cornell ration for your next chicks. It is: three pounds corn meal, three pounds bran, three pounds middlings, three pounds beef scrap, one pound ground bone. This is perfectly balanced and has proved very satisfactory wherever used.

Corn meal or corn in any other form is always dangerous for turkeys before they "shoot the red" at about three months of age. So many people have learned this by sad experience that it is not necessary for us to experiment. Whole wheat, cracked wheat, and rolled and steel cut oats are the best grain feeds for poults. After three months some corn may be given, but it is not necessary till fattening time.

Infertility is sometimes the result of inbreeding, but more often of an overfat condition of the breeding stock. Sometimes eggs are infertile because the tom is immature; sometimes because the breeding stock is too closely confined or improperly fed. Breeders need a good deal of green feed, especially grass. The male need not be over ten months of age, but he must be strong and vigorous.

You exerted yourself unnecessarily to keep the incubator turks "lively." That was just what they did not need. I don't say it killed them, but young turkeys are weak and slow in motion at first and need to be kept quiet. This is one reason why chicken hens are not the best mothers for them, they fuss too much. Turkey hens are quieter. It is very difficult to raise turkeys artificially unless you have a very good brooder and poults enough to fill it. They require more heat, if anything, than chicks, and will pile up in the warmest corner of the brooder in spite of all you can do. Even now I see my six weeks' old poults cuddling under the mother hen's wings when the wind turns cool in the evening, while chicks half that age are taking care of themselves. Had you given your poults to the hen in the beginning they would have done better.

If the bunches on your gobbler's legs are at the joint they are probably caused by rheumatism, and rheumatism is always due to dampness somewhere. See first of all that your adult turkeys roost high and dry. They need no shelter in summer and only an open shed in winter. Any good liniment may be used externally. For internal use Mrs. Mackay, one of the most successful eastern turkey breeders, recommends this preparation: "Get elder bark and scrape off the outside skin, cut in small pieces and put in apple vinegar. It does not matter how much bark you put in, but the stronger it is the better. Put in a half gallon fruit jar and add a piece of alum as large as a walnut and the same amount of copperas. Put in the jar all the bark you can get in, pouring the vinegar over it. Put enough of this liquid in the drinking water to make it taste of acid, but not enough to be unpleasant to the taste." A little tincture of iodine in the drinking water is good as a tonic.—J. A. K.

FACTS ABOUT EGG FORMATION

By T. E. Quisenberry.

For some time the pathological department of the Missouri state poultry experimental station has been observing abnormal eggs and facts as to their cause, significance, etc.: 36 abnormally small eggs were recently examined; 25 contained yolk or some part of yolk, five contained blood clots, three contained particles of chalazea, one contained a hard lump of albumen, one a normal yolk, one contained a ruptured yolk and no albumen.

The small eggs were laid in the regular course of laying, the greater number of the hens laying the day before and the day after, two laying the same day. The common idea is that when a hen lays an abnormally small egg that the hen has laid her clutch and is going broody or else it was the first egg laid by a pullet. This idea is incorrect for, as a rule, the hens which lay small eggs lay regularly both before and after laying the small eggs. The facts are, that any object getting into the funnel of the oviduct will stimulate the oviduct action so that it is moved down the oviduct, causing the albumen and shell to be placed around it. In certain yards at this experiment station on April 28, 1914, 1068 eggs were laid. On the night of April 28th there were 27 soft shelled eggs laid, or an average of about one egg to 40 hens in these same pens. Of the 18 hens which we know positively laid soft shelled eggs, 12 of them laid on that date, the day before and the day after, showing that the soft shelled egg is laid in the regular course of laying, between hard shelled eggs. With regard to the soft shelled eggs, there are many theories advanced such as the lack of egg shell forming material, overexertion on the part of the hen or of her egg organs, inflammation of oviduct, etc. The tests made here indicate that a lack of shell forming material such as shell, grit, etc., is not always the cause of soft shelled eggs. They may have imperfect shells, but a lack of material will not produce a soft shelled egg one day and a hard shelled egg the day before and the day after. It is interesting to note that principally during the day is nature's time for the movement of the egg through the oviduct, and at night the egg rests and receives the shell in the shell forming section. For this reason the soft shelled eggs are laid in the fore part of the night, and the harder shelled ones later in the night. The records of 24 double yolk eggs were kept. Six of the hens did not lay the day before, but laid the day after; eight of the hens laid the day before, but did not lay the day after; nine of the hens laid the day before and the day after; one hen laid only one egg during the month. Some of the double yolks were contained in one chalazea, while some of them were in separate chalazea. In eight large eggs containing two yolks which were examined, six eggs contained yolks which were the same size. In two, one yolk was smaller than the other. In three the yolks were in the same chalazea. One of the largest hens in the contest is a Plymouth Rock and weighs eight and one-half pounds and has laid 12 eggs, or not quite one and one-half eggs to every pound of her body weight. One of the smallest hens in the contest is a Campine and weighs one and one-half pounds and has laid 103 eggs, or nearly 70 eggs to every pound of her body weight.

FEATHER EATING

Many people have trouble with their fowls forming a habit of feather eating, which is much more annoying than one may think. This habit is usually confined to fowls that have small runs, but it sometimes happens where they have large range. I have seen fowls quite naked of feathers and in summer they will pick one another until they bleed. Some think that certain breeds are worse feather pluckers than others, but in my opinion one breed is just as bad as another.

There are several causes and remedies. The most common cause is insects and vermin. The fowls pick at themselves and in doing this they pull their feathers out. Then in a few days the pin feathers begin to grow and the feather pluckers observing them, with the moisture which consists principally of glutinous matter, peck them out also, and in this way keep the fowls quite bare.

The first thing to do to effect a cure, is to at once remove the feather eaters from the rest and place them in a pen by themselves. If they are left with the others they will teach them the habit too. They can be readily discovered by watching for them, out of sight, when the sun is shining and the fowls are pluming themselves.

Often when a feather plucker is shut up in a pen for two weeks it does not go back to the habit when returned to the flock, but if it does, it is well to shut it in a run with another bird well covered with carbolated vaseline, or any such ointment. It need be only applied to the parts the hen in question usually attacks. If this does not take effect I advise killing the hen, unless a very valuable bird; but if the latter, cut or file away the edges of both mandibles, so they will not close tight for one-eighth inch or so back. In this way the bird can eat readily but cannot hold a feather. Oftimes, lack of exercise and green or animal food causes feather plucking.

It is a good plan to feed sulphur in the mash when one sees the hens starting. In a very confined run give the birds all the occupation possible. —Successful Farming.

Perhaps the wages of farm help are no higher now than they were 20 years ago when everything is taken into consideration, but that is a thing that might adjust itself. The real question is: How long will it be possible to get hired help at any price?

The Summer Season

Don't expect to cram for eggs in the fall without preparation during the summer.

COULSON'S EGG FOOD

used during the summer will reward you with a good egg yield in the fall.

Secure it from any reliable poultry supply house.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Black Eye Bean

I am a recent settler in Ventura County and am interested in the bean known as the "black eye." Although great quantities of this bean are raised in this county, I have so far been unable to find any one who can definitely tell me where the crop goes and for what purpose it is used. Every one I have asked says that the black eye bean is not much used as a table food. Some say it is used to adulterate cheap coffees, others say used in making giant powder, and one man told me that great quantities are sold throughout the country as "salted peanuts." I will greatly appreciate some authoritative information as to where, how and for what purpose the black-eye bean is marketed.—Subscriber, Fillmore.

The black eye bean is used to a very large extent as a food. Colored people especially seem to take to it, but perhaps its largest use is as seed for green manure crops. As to its use in adulteration of coffee, we are informed that this is sometimes done, but as a commercial proposition this makes but a very small outlet for beans. It is also supposed to be used as a filler for giant powder, but this use is also very limited. As to use in production of salted peanuts, we are not informed; we will secure information along this line if possible. The best part of the black eye bean proposition is that wherever it has been produced it has always sold at fair prices. It is, however, safest to produce in carload lots in order to be sure of securing a purchaser at a good price. If one grower cannot plant to that extent, others should unite with him. Price to producers usually ranges between three and four dollars per hundred pounds.

Scaly Leg

I have a few young turkeys that have a scale all over their legs from feathers to feet. They roost with Plymouth Rock chickens. What is the cause of the scale and what can be put on their legs to stop the scale and have their legs smooth at marketing time?

Wash the legs thoroughly with soap and water, using a stiff brush. After drying, apply the following ointment: Four teaspoons washed sulphur, 20 drops carbolic acid, two tablespoons vaseline. Mix thoroughly and rub the legs well with this. In bad cases this should be repeated in a few days. Kerosene will destroy the scales, but it also spoils the color of the leg. Scaly leg is always caused by filthy yards and houses, but it is quite contagious and will be passed on from fowl to fowl after the filth which caused it has been removed. Infection also comes from roost poles where infected fowls have roosted, and these should be painted with lice killer or with kerosene and crude carbolic acid. Keep your turkeys away from the chickens. They are far more susceptible to filth and prefer roosting out of doors.—J. A. K.

Summer Ration

Will you kindly advise through the columns of your weekly in regard to feeds for chickens: At present I am feeding the following ration, but I believe it could be improved on: Dry mash before the fowls at all times consisting of 25 pounds bran, 10 pounds shorts, 10 pounds ground oats, 5 pounds corn meal feed, 5 pounds beef scrap (prepared), 5 pounds alfalfa meal, sprinkling of charcoal and salt. In the evening I feed wheat. Fowls have oyster shell and grit before them. Am getting very few eggs, though hens laid well this spring. They seem rather fat. Practically all are White Rocks. Please publish ration for laying hens, growing pullets, roosters for market or consumption.—Subscriber, Pasadena.

If your hens have been laying well for a good while, it is time for them to let up a little, still, being Rocks, they are probably fatter than they should be. The ration is too fattening for a heavy breed in winter and too heating for summer. In this climate Rocks and Orpingtons will put on flesh if they are given corn or corn meal. Try this ration for the layers the rest of the summer; three parts bran; one part oat chop, one part alfalfa meal, half part fish meal, half part good beef scrap, a little fine bone meal, charcoal, ground oyster shell and salt. It is a good plan to close the dry mash hoppers at night and keep them closed till noon. Feed wheat or wheat and oats or soaked rolled barley, which is cheaper than usual just now, at night, and plenty of green at noon. Some experts give their hens during the summer a hopper of coarse fish scrap and another of bran, and give no mixed mash at all.

Growing pullets must be kept growing, and if they have plenty of exercise a little corn meal will not hurt them. A good mash mixture for pullets three months old and over consists of 20 pounds bran, 10 pounds cornmeal, 10 pounds middlings, 10 pounds beef scrap and a little salt and charcoal. As they approach laying maturity a little linseed meal may be added a part of the time, but care must be taken not to force the pullets. With this mash is used a grain ration of cracked corn, wheat and oats. Sprouted oats are preferable to dry and a most excellent growing feed, as are both skim milk and sour milk.

A good ration for broilers consists of 10 pounds bran, 25 pounds cornmeal, 25 pounds middlings, 25 pounds ground oats, 15 pounds beef scrap. This should be moistened with water, or better still, skim milk, and fed three times a day. There is no "best" feed.—J. A. K.

Broom Corn

Is broom corn produced in California? To what extent, and is it a profitable crop?—Subscriber, Los Angeles.

There is considerable broom corn produced in this state, some of it is most excellent. There are three producing sections. About Sacramento some seven or eight cars are produced. In the Tulare Lake section of the San Joaquin Valley, about the same amount. In the Imperial and Coachella Valleys in Southern California some four or five carloads. Broom corn, like ordinary maize, requires rather a high temperature both day and night. Near the coast or in altitudes where the nights are cool best results cannot be obtained. The production, per acre, under proper conditions, amounts to not far from a ton, after which the second crop or short broom is secured at the rate of about one-half ton per acre. It is now somewhat late for this season's planting, though June and early July are the best planting months. It is planted rather thickly in rows two and a half to three feet apart. The close planting is to induce fine branches of the broom. Two or three irrigations are required. When the corn is about 10 inches high it is thinned and irrigated. This is, of course, cultivated in and afterwards light harrowing is given to prevent crust forming on the surface. Harvesting is done when the seed is in the "milk." The harvesting is done by breaking at the first joint below where the broom branches. After this, other stalks are sent out, which gives the finer, higher priced second crop. The seed costs the farmer about 10 cents per pound, but the amount required is so infinitely small that cost of seed is not a factor.

Grafting Over Peaches.

I have three acres of three-year-old peach trees. They are freestones, and I wish to change to cling variety. Would it be more profitable to bud or to replace with new trees? When the trees were planted they were supposed to be Lovells, but suppose it a mistake of the nurseryman. Do you think they would replace the trees or could I recover damages?—Subscriber.

We do not believe it would pay to attempt to work over a bearing peach orchard. Certainly not, unless one who understands grafting and caring for trees after they are grafted has the matter in hand. The grafting over of an apple orchard is a comparatively small matter, but none of the stone fruits take so kindly to this process. We believe that nurserymen generally make a reservation in selling nursery stock that they will be responsible for trees which are not true to name only to the extent of the original purchase money. Loss of time and cost of bringing an orchard to bearing will not be compensated for. It depends, however, somewhat on the bill for the sale of these trees which the subscriber accepted.

Gophers and Squirrels.

The popularity of the automobile should be increased by the following, which comes from Mr. M. C. Allen, a Cultivator subscriber at Pomona. The auto has often served to churn the cream, pump the water and rock the baby, now it comes in as a gopher and squirrel exterminator. The suggestion of Mr. Allen seems to be a good one, and we believe it will make quick work in disposal of these pests

"Are any of your readers troubled with gophers or squirrels? If so tell them to put plenty of lubricating oil in their automobile so it will smoke when the engine is running, attach hose to exhaust pipe, place the other end in gopher's hole, pack dirt around it and start engine. Look over the field and if smoke comes out anywhere stop it. You can kill more gophers or squirrels in half a day than you can in a month with poison and traps.

Mediterranean Flour Moth

I send a flour sack in which I had bread wrapped. You will find on it some exceedingly small worms. The can in which the bread is kept is scalded every week and a fresh sack put in and still the pest remains. It burrows in the bread and is a great nuisance.—Subscriber, Ventura.

Examination of these "worms" under a strong glass showed them to have a head somewhat like a borer. The insect was so small as to be almost invisible. It was referred to Secretary Essig of the state horticultural commission and in his absence Mr. Leroy Childs writes:

"These are the immature larval forms of the Mediterranean flour moth, Ephestia kuehniella Zell, all of which I find are dead. This insect is of wide distribution and often occurs in such numbers as to be a serious pest in flour mills, where it takes advantage of all cracks and out of the way places, making control by cleaning up almost impossible. It feeds upon almost all produce of grains and is often found in the household. We would suggest in controlling this insect a thorough cleaning out of any old flour sacks, mush boxes and the like, that might possibly be in a kitchen, and also the complete sterilization of bread can and wrappings that may be placed about the bread. Perhaps a cloth placed over the covering when a lid is placed over the can would aid in keeping out the pest, if the young have taken up their abode in inaccessible places. The brood, however, will soon be hatched and the trouble will be over."

Beans in Warm Valleys

Can beans be grown successfully in the Perris Valley? If so, where have they been grown, what varieties and with what success?—Subscriber, Fullerton.

The Black Eye or any bean which will grow well under arid conditions should give excellent returns in the Perris Valley. A new bean, or rather one of the oldest beans known, but new to California agriculturists, is the Tepary, which has been furnished to the world by the Arizona experiment station. These beans have been grown under desert conditions by Indians of Arizona since long before a white man came to that state. The experiment station has made tests and find they are one of our very finest beans and will do well under the hottest conditions.

Pollenizing Feijoas

I have a feijoa that blooms, but never fruits. Are they self-sterile and should other trees be planted near to insure fruit? Are guavas self-sterile and how close together should they be planted?—Subscriber, Watsonville.

Mr. D. W. Coolidge of Pasadena writes: "We do not consider the feijoa self-sterile, on the contrary our most productive plant stands a long distance from others. The guavas are self-sterile without a doubt. It is true, however, of both feijoa and

guava, that some plants blossom freely and yet do not set fruit. I have never been able to define the cause of this." Guavas are usually planted either as a hedgerow or in rows six to eight feet apart and three to five feet apart in the row.

Feed for Cow

I recently bought a fine Jersey cow and have tried to be careful in feeding her, but am told she can eat anything without harm. I have a few vegetables from my garden, such as squash, cucumbers, potatoes, etc. Will it be all right to feed those to her? Can you give me a good ration for a milk cow?—Subscriber, Inglewood.

Cows are somewhat like humans in their requirements. That is, the feed which will be best for one cow is not always best for another. The Jersey, as a rule, does not take so readily to roughage as do some of the larger breeds, but excepting turnips we would not hesitate to feed green stuff from the garden. If fed immediately after the milking we do not believe there would be any unsatisfactory flavors and possibly it might be the means of securing larger milk production than where the cow is fed on dry hay ration. As to best ration, that will depend upon the possibilities of your own section, excepting that alfalfa will probably be the cheapest foundation of the rations. Concentrates or mill feeds are usually rather expensive for profitable return, especially when alfalfa is as low in price as at present. Soiling crops, such as corn, planted thickly and cut green, make an excellent addition to dry alfalfa.

Chickenpox.

Our chickens are sick, or at least they go blind in one and sometimes both eyes, and bumps are formed about the eyes. They want to eat but seem to grow worse. What is the trouble?—A Subscriber.

If subscriber will send his name, which he did not sign, we will be glad to forward copy of the Cultivator of November 20, 1913, in which Mrs. Koethen describes the disease of chickenpox and its treatment.

Transferring Insurance.

I wish to know in regard to household goods which were insured in one county and later moved to another and burned. They were insured for three years in Los Angeles County, and on moving to this county they were burned a few weeks since. My insurance does not expire until 1915. —Subscriber, Tulare County.

We fear our subscriber will be unable to collect any insurance on the goods. Household goods are always insured in a certain building, the location of which must be definitely given and the insurance ends the moment they are moved from that particular building unless the policy holder has taken the precaution to go to the office of the insurance company and ask for a transfer. This is a very simple matter and costs the small fee, we believe, of 25 cents.

Castor Beans.

Can you give information as to the growing of castor beans and whether it would be profitable to grow on a commercial basis in the Salt River Valley? Is there a castor oil mill in this section?—Subscriber, Higley, Arizona.

We do not know of any mill now in operation. Many canyons of Southern California are filled with rank growing castor beans, which at one time gave such promise to the oil industry that mills were established. However, the cost of gathering the beans was such that we believe the mills have all ceased operation. It is a crop for cheap labor and waste land. We do not think there is any opportunity whatever for profit in the cultivation of this crop.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Worms.

I have a cat that has been bothered with diarrhea for the last two months. He is thin, but eats well. I find that he is passing small white worms, fully half an inch long and about the size of a cord.—Subscriber, Brawley.

Have your druggist prepare the following: Pulverized areca nut two drams made into 12 powders. Give one powder in a little milk every morning. Also get ten three grain tablets of santonin and give one every night. We would like a report on this in a month.

Horse Out of Condition

My horse was recently seriously affected with colic or other disease and has only partially recovered, in fact, is very much out of condition. His coat is rough, he seems to be stiff; when he walks his joints crack. What is the trouble with him, and what may be done to cure this condition?—Subscriber, Azusa.

The stiff joints following the colic would indicate a rheumatic condition. It will take some time and a long course of treatment to cure him. Get the following powders and give as the druggist directs: Nitrate of potash, four ounces; acetate of potash, four ounces; salicylate of soda, three ounces; bicarbonate of soda, three ounces, and nux vomica, two ounces. Mix and make into 24 powders. Give one powder morning and evening. Would also advise giving him one pint of raw linseed oil and one ounce of turpentine twice a week for three or four weeks. See that he gets plenty of water to drink.

Bloody Milk

One of our cows, a Jersey and a heavy milker, has been giving bloody milk out of one teat for about a month. She eats well, but is very thin. Can you tell us what the trouble may be and suggest a remedy?—Subscriber, Tulare.

Take two pounds of epsom salts and one pound of common salt, mix them and give a handful once a day. Rub the quarter that gives the bloody milk for several minutes every time you milk her and be sure that you milk her clean. Would suggest that you have her tested for tuberculosis.

Scratches

I have a mare that has the scratches (at least that is what the veterinarian here calls it). She has had it for five or six months and I have been unable to find anything to effect a cure. Cracks open under the fetlock on both front feet.—Subscriber, Lindsay.

Clip off the hair and wash the parts clean just once. Then apply twice a day a lotion of chloride of zinc, one dram to the pint of water. Get your druggist to put this up for you and I would advise you to get a gallon of the mixture. Pour out half a teacup of the lotion and warm it before applying.

Loco Disease

What is good for a locoed horse? What causes loco? How do animals act?—Subscriber, Corning.

The loco disease or trouble is caused by a horse eating a weed that grows on the plains and near the mountains of the southwestern part of the United States. It has a peculiar action on the brain and no one has ever found a remedy for it. The animal appears stupid and at times takes crazy spells similar to blind staggers. No two of them act exactly alike, but there are symptoms in all of them that show that the brain is affected. They generally grow worse and in a short time die in a fit or spasm. Some linger for a long time and are serviceable at times, but you cannot rely on them. The disease is hard to describe or explain, but once you become familiar with it you will soon recognize it.

MONEY MAKING LITTLE LINERS

In this department we will insert your advertisement under a classified head for 12 cents per line per issue. No ad accepted for less than 3 lines. Our classified columns are the clearing house for our many thousand readers.

Household Department

The House of God.

Where the great winds are loud about the moors,
And the stars beacon, and the sun endures;
Where the armadas of the clouds set sail,
And lyric waters shout adown the dale,
Where flowers make redolent the vernal sod,
Here is the House of God!

In highways and in byways of the earth,
Where there is kindliness and simple mirth,
Where hands touch hands, and lips to lips are set,
Where there is sorrow, and wan eyes are wet—
Where little children smile and beck and nod,
Here is the House of God!

—Clinton Scollard in Delineator.

THE YELLOW PERSIAN

(Concluded from Last Week)

The golden gleam of the rising sun was just kissing the tops of the Sierras next morning when Miss Bessie Lorimer wended her way to the poultry yards to supply the needs of her little flock. The day before she had accompanied her father on a visit to an old friend and the hour of their return was later than anticipated, so while prone to lie abed this morning, remembrance of her neglected poultry compelled an early rising.

As she fitted the key to the spring lock and swung the door ajar, she was startled to note the disarray within. To retreat was her first thought, but curiosity and courage triumphed and she tiptoed silently to the wall of sacks and peered cautiously down. One swift glance showed her the intruder and she retired to the door with beating heart,

But that brief glance had revealed the fact that the man was either sleeping or dead—she was not sure which, so hesitatingly she stole back for another look.

She saw a long-limbed, blonde young man and snuggled under his arm, a big yellow cat, both sound asleep. As the girl's eye traveled down the man's figure she noted that he was without shoes. And yet he did not look like a burglar or a tramp. His clothing was good and well made and he generally presented an appearance of prosperity out of place in one who would choose such a place for a lodging.

The situation puzzled her and she determined to keep the young man a prisoner until she knew more about him. To this end she was stealing softly from the building when she came face to face with her father, who, noticing her startled look, exclaimed:

"Why, Bess, what's the matter?"

Motioning him to silence, she pointed to the pile of sacks. Mr. Lorimer, a middle-aged man of stocky build and genial countenance, at once proceeded to investigate the miniature fort on the floor of his store-house.

A vigorous shake aroused the enemy, who, thus rudely awakened from slumber, found himself looking straight into a pair of entrancing brown eyes that returned his gaze with interest and some alarm.

"Well, young man, what have you to say for yourself?"

These words in a stern male voice, accompanied by a firm grip on his collar, convinced Bob, however, that he had another and more to be feared antagonist than the pretty brown-eyed girl before him, and he had, besides, the additional disadvantage of being so placed between the sacks of his impromptu couch as to be unable to defend himself, or even to get a good view of his questioner.

The yellow Persian, in the meantime alarmed at the disturbance, was anxious to escape and was only prevented from doing so by the proximity of Miss Lorimer to the door.

"Don't let that cat out! Close the door, ma'am, please."

Bob's tone was so authorative that the girl obeyed instantly, the while she cast upon the young man a glance of mingled inquiry and indignation.

"Now, young man, I am still waiting for an explanation of your presence here?" and the vigorous hand that held Bob's collar emphatically seconded the owner's voice.

"Pardon me, sir, but if you will kindly release the pressure on my throat I will have more breath for the explanation that is undoubtedly due you. As you see, escape is impossible with the door so ably guarded."

And the young man gravely bowed to his captor's daughter.

"I'll take care of that myself, young man," said Mr. Lorimer, promptly placing himself with his back against the door. "Now go ahead and spin your yarn."

This Bob proceeded to do, giving a whimsical account of his proceedings of the previous day and concluding with a recital of how he had been trapped in the store house.

"And" he continued, "it occurs to me that you have placed yourselves in the same predicament by closing that door."

"Not at all, sir," said the girl. "As you see, the door opens readily. It has a spring lock opening with a key from the outside only, but on entering I always take the precaution of stopping the catch on the inside. By the way, you speak of your sister. What is her name, may I ask?"

"Mrs. Donald Rogers."

"Why, are you Dorothy Rogers' brother?"

"I certainly am," said Bob, with a grin.

The girl burst into a merry laugh and even her father's usually genial countenance relaxed much of the sternness that gentleman had thought proper to assume on discovering an intruder on his premises.

"And does Dorothy know where you are?" said the girl, still laughing.

"Why, she knows I'm in the neighborhood somewhere."

"I'll go and call her up at once and see whether you are missing. If you are really Dot's brother she will be very uneasy about you."

"Do so, daughter, and I will keep guard over this young man until his identity is fully established."

In a few minutes the girl returned and laughingly confirmed Bob's story and immediately her father became profuse in his expressions of regret at the annoyance to which Mr. Hastings had been subjected and insisted on his coming in to breakfast.

"We have often heard of you, Mr. Hastings, for Bessie and your sister are bosom friends."

"I should say we were," seconded Miss Lorimer, "and Dot has often promised us your acquaintance, but we never expected to make it in such an unconventional manner."

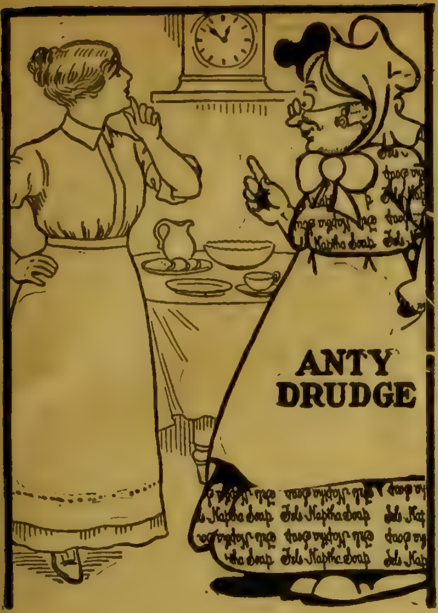
While this had been transpiring, Bob had remained partially concealed behind his pile of sacks. Now, however, he rose to the full height of his young manhood and immediately remembered that he was sans footgear Explaining his predicament to Mr. Lorimer, that gentleman instantly volunteered to fetch his shoes, and shortly returned in a gale of laughter holding at arm's length two sticks which he had thrust through the tramp's discarded brogans and now presented to Bob with an elaborate bow.

"Rum taste in footwear you have, Hastings. In fact, these are about the rummiest shoes I ever saw."

"Why," stammered Bob, "those are not my shoes. I left mine just outside the fence by the gate."

"I have no doubt but what you did, sir," laughed Mr. Lorimer. "I also doubt not that they are far away by this time. Just wait a minute and I'll fetch you a pair of mine. They will at least be better than the dilapidated articles you have received in exchange."

While his host was absent on this errand of mercy, Bob and the young



Mrs. Swiftly—"I wish Johnny would hurry. I sent him to the village for some Fels-Naptha Soap because I used the last for my wash this morning. I can't get along without it. I use it for everything. Johnny came home at noon and said to me: 'Say, Ma, I got a hundred in two studies this morning,' and when I asked what, he said: '40 for 'rithmetic and 60 for geography.' Isn't he a case?"

Aunty Drudge—"He's cute, all right. But why don't you buy Fels-Naptha by the box or carton—then you'll always have it on hand."

If you have Fels-Naptha on hand, you're ready for any kind of work—washing, house-cleaning, dish-washing.

There is nothing better than Fels-Naptha for washing flannels or woolens. It leaves them soft, white and woolly. And it's fine for colored clothes, too, either wool or gingham.

Use it the right way, in cool or lukewarm water.

Full directions are on the Red and Green Wrapper.

Fels & Co., Philadelphia.

lady mounted guard over the yellow Persian, the animal betraying an unmistakable preference for the open air.

"Poor fellow," said Miss Lorimer, "he must be thirsty."

"Are you referring to me or the cat?" said Bob, gravely.

"To the cat, of course," retorted Miss Lorimer, merrily. "I should judge you quite capable of supplying your own wants."

"When I have my freedom, yes. Not when I am penned up like this. I am so hungry I could eat 'most anything."

"Then I shall see about breakfast at once. But I shall serve His Persian Majesty first."

With a nod to Bob she left the building, returning shortly with a pannakin of milk for the cat, while Mr. Lorimer brought the promised shoes for Bob.

Leaving the cat a prisoner, the trio made their way to the house, where a substantial breakfast was merrily discussed. And the meal was hardly concluded when Dorothy arrived in the car and, after listening to Bob's adventures in pursuit of the yellow Persian, insisted on taking Miss Lorimer home with her to spend the day.

So the cat was coerced into a plebeian chicken crate and returned in ignominy to his mistress, who received him with tears of joy and gratitude and promptly confined him in a covered poultry run until he should learn the error of his ways and behave as a respectable cat should.

Feeling rather heroic, but with his self-esteem kept within bounds by the chaff to which he was subjected by his sister and her guest, Bob drove the little car home, there to be waylaid by Little Bob and obliged to recount his adventures in detail, and then tell them all over again.

Of course, when evening came, he had to drive Miss Lorimer home. And before many days he was spending much of his time at the model home. So Dorothy was not so surprised as she seemed when Bessie Lorimer showed her Bob's engagement ring with a circlet of diamonds surrounding an image of a cat done in yellow enamel.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle.

Breakfast.

Fresh Peaches Boiled Rice, Cream.
Baked Eggs Cream Toast
Coffee.

Lunch or Supper.

Potato and Onion Soup.
Baked Sardines. Parsnip Fritters.
Cucumber and Lettuce Salad.
French Dressing.
Peach Meringue Pie.
Tea or Milk.

Dinner.

Beefsteak Pie Rice,
Pimento-Cheese Sauce.
Corn Salad.
Spiced Gooseberries, Coffee Cake
Coffee.

Baked Sardines.

To one small can of sardines allow two tablespoons of butter, four tablespoons of bread crumbs and one small onion, finely minced, and two eggs, salt and pepper to taste; wipe all the oil from the sardines, divide them into halves and lay in individual baking dishes, melt half the butter, pour it over them and add two tablespoons of hot water; beat up the eggs and gradually mix them into the bread crumbs, onion, salt and pepper and add remainder of butter; spread this mixture over the sardines and bake fifteen minutes.

Potato and Onion Soup.

One pound of potatoes, one large onion, one ounce of dripping, one quart of boiling water, one-half pint of milk, one tablespoon of crushed tapioca, pepper and salt to taste. Peel and slice the potatoes and the onion, then put them in a stewpan with the dripping, and let cook lightly for five minutes. Pour over one quart of boiling water, and let all simmer till soft enough to press through a wire sieve. When done, return to saucepan with one-half pint of milk; let come to the boil, and then gently stir in the tapioca. Add pepper and salt to taste and allow the soup to simmer until the tapioca is quite clear. Serve with croutons.

Pimento Cheese Sauce.

Melt one-fourth cup butter, in this cook one-fourth cup flour, half teaspoon salt and one-fourth teaspoon paprika. Add two cups rich milk and stir until boiling, then add one cup minced pimentos and one and three-fourths cups of mild cheese, grated. Set over boiling water and stir until smooth.

Parsnip Fritters.

Scrape parsnips and cut in two and a half inch lengths. Cut again in lengthwise halves or quarters, according to size, and cook in boiling, unsalted water until tender. Remove from pan, coat with butter and, if desired, sprinkle over a few drops of lemon juice. Dip in batter made of the yolks of two eggs, beaten, one-fourth teaspoon salt, a teaspoon of olive oil or melted butter and three-fourths cup milk. Gradually stir into this one cup of sifted flour. Make this batter one hour before meal time and when ready to use add the white of one egg beaten dry. Fry the fritters in hot fat.

GETTING NEW RECIPES AND KEEPING THEM

Written for California Cultivator
By Katherine Graham

Some of the very best recipes I have ever found have been in free cook books sent out as advertisements, so now whenever I see a cook book advertised free or for a nominal sum I always send for it. Never yet have I failed to find good suggestions and new suggestions.

The advertisers know that to give full value as an advertisement the recipes must be not only attractive but practical; that after a housekeeper has used a half dozen times an excellent cake recipe that always calls for Blank's Baking Powder or Blank's Shortening, she is very likely to order Blank's goods from her grocer and give them a trial.

Mark Your Favorites.

When you have used a recipe and found it good, do you mark it? It will save time and bother at some future date when you are hunting hurriedly through your cook books for something for dinner.

The Recipe File.

A file consisting of a box, index cards and filing cards, is the most satisfactory way of keeping recipes cut from papers or collected from friends. A stout pasteboard box answers nicely, but a regular wooden file will be a thing of comfort your life long. The index cards may divide the recipes just as a cook book ordinarily is divided, into soups, fish, meat, poultry, game, stuffings, meat and fish sauces, eggs, vegetables, salads, cereals, breads, cake, pastry, puddings, etc.

Then in my file I have a division for menus for breakfast, lunch and dinner, one for picnic lunches, one for lists of favorite dishes of each member of the family or frequent guests, one for cooking time table

HAY

Under date of July 11, Scott, Magne & Miller say:

Receipts of hay for the past week were 2853 tons, about the same as las week, 2906 tons.

The market is quiet and receipts ar moving with difficulty, very little choic hay arriving. Sale of alfalfa is limite because of abundance of this and clove hay in practically all dairy districts Straw remains unchanged.

We quote the average wholesal prices on carload lots of new crop ha on today's market as follows:

Fancy Wheat Hay, lt. bales	.11.00@12.0
No. 1 Wheat or Wheat and Oat	.9.00@10.0
No. 2 Wheat or Wheat and Oat	.7.00@8.5
Choice Tame Oat	.10.00@11.0

Citrus Fruit Market

LOS ANGELES, July 15, 1914.

A material shrinking in shipments has aided in clearing the market, and very satisfactory conditions prevail. Shipments are now running not far from 100 cars a day. There will probably be still lighter shipping during the next four or five weeks. Not far from 40 per cent of the total Valencias are shipped. F.o.b. California prices not far from $2.00 per box.

Ten or 15 carloads of lemons are going forward daily and are meeting with fair reception in Chicago and the West; east of Chicago prices are disastrous. Thousands of boxes were sold in New York and Boston yesterday at from $1.10 to $1.35. There are afloat 341,000 boxes. Last year's shipments the same date only amounted to 323,000 boxes, while the average for the past ten years for this same time has been about 250,000 boxes.

Shipments.

Shipments of oranges from Southern California to date since November 1, 1913: 31,905 cars, lemons, 2,261; total 34,166. To same date last season: oranges, 12,052 cars; lemons, 1,811; total, 13,863. Total of all citrus fruits two years ago this date, 30,822.

NEW YORK, July 13.—Twenty-two cars Valencias, four sweets, one seedlings, one plain oranges, one mixed, one lemons, sold. Market unchanged on Valencias, weak on lemons. Fair and warm.

"I think the baby has your hair, ma'am," said the nurse girl, looking pleasantly at her mistress.

"Gracious!" exclaimed the lady, glancing up from her novel. "Run into the nursery and take it away from him! What will he do next "—Stray Stories.

PHOSPHORUS

"You talk about phosphorus, and sometimes you say phosphoric acid. Do they both mean the same, or, if there is a difference, can you explain it to us so that an ordinary individual can understand?"

This question was fired at a professor from the experiment station who was discussing the subject of soil fertility at a meeting of a farmers club.

"There is a difference," replied the professor, "and it is well worth while for farmers to understand the meaning of the two terms. A fertilizer containing a certain percentage of phosphoric acid is not worth nearly as much as a fertilizer containing an equal percentage of phosphorus. Perhaps I can best explain the difference by an illustration.

"There is practically the same difference between phosphorus and phosphoric acid that there is between lemon and lemonade. A glass of lemonade may contain the juice of one lemon but the water which makes up the largest part of the bulk is free and plentiful and you should pay but little, if anything, for it.

"Phosphoric acid is a combination of phosphorus and oxygen in the proportion of about three parts of phosphorus to four parts of oxygen. In other words, in seven parts of phosphoric acid there are only three parts, or less than half, phosphorus.

"There is no more reason why a farmer should pay anything for the oxygen in phosphoric acid than there is for him to buy water for making lemonade. Air and water contain large quantities of oxygen and he can get his supply free from these sources.

"In labeling their goods, most manufacturers of fertilizers show the percentage of phosphoric acid in the goods. Some experiment stations and chemists give the percentage of phosphorus in the products tested by them, especially in the case of raw rock phosphate. When considering the relative value and cost of two fertilizers it is important that you compare them upon the same basis. Be sure that you are not considering phosphoric acid in one and phosphorus in the other. Other things being equal, a fertilizer containing twenty-five per cent phosphoric acid is worth no more than a fertilizer containing twelve per cent phosphorus."—Successful Farming.

UNPROMISING

A retail dealer in leather goods, doing business in Baltimore, wrote to a firm in southern Massachusetts, ordering a carload of the merchandise. The firm wired him:

"Cannot ship your order until the last consignment is paid for."

"Unable to wait so long," telegraphed the leather merchant. "Cancel the order."—S. C. Clarke in February Lippincott's.

WHY HURRY?

"My dear Reginald, now that you've left college, you must really begin looking for some sort of employment."

"But don't you think, mother, it would be more dignified to wait till the offers begin comng in?"—Life.

Several cities in Hungary maintain municipal meat markets.

GETTING NEW RECIPES

(Continued from Page 69)

(time required to cook different foods), one for cold day dishes, one for summer dishes, one for Mexican recipes, etc. The beauty of a filing cabinet is that new divisions can be added whenever wanted and each can be placed in its alphabetical order without in the least disturbing the other cards in the file. I think the alphabetical filing is most convenient.

Not every recipe clipped from paper or magazine is really filed. A good plan I have found is to drop loose clippings in the file in front of the division card where it belongs; for instance a recipe for a new cake I drop in front of the index card marked cake. Then after I have tried it and found it good I paste on a regular file card and place it in its alphabetical order in the cake division. In this way my pasted recipes are only the "tried and found worthy" ones. Of course those known to be good received from friends are placed on cards and filed at once.

CAPPING JELLY.

Instead of covering jelly with melted paraffine, as in former years, I last summer cut circles from the ordinary waxed paper and laid flat on the surface of the jelly, then cut larger rounds of the same waxed paper, dipped them in white of egg and pressed down over the tops of glasses. All my jelly kept perfectly.—G. B., Los Angeles.

TWO WAYS OF LOOKING AT IT

A perspicacious young man, passing where an old colored man was busy setting fire to the dead grass in a meadow, accosted him thus:

"Don't do that, Uncle Eb, don't do that!"

"Why so, sah, why so "

"You will make that meadow as black as you are."

"Never mind dat, sah, never mind dat! Dat grass will all grow out an' be as green as you is!"

FOND DADDY

Dr. Wiley says his new infant is an absolutely perfect baby. This does not necessarily prove that the kid is normal, but it proves that his daddy is.—Boston Transcript.

THE HOOKWORM

Buttons and hooks, buttons and
hooks,
When a man's married, you'll know
by his looks. —Judge.

A WONDERFUL MAN

"Eh, doctor," said a gillie of a small Scotch town to a friend, "he maun hae been an extraor'nary man, that Shakespeare. There are things hae come into his head that never would hae come into mine at a'."

Every dairyman and rancher who has or contemplates handling milk products successfully should write today for catalogues of the Primus Cream Separator and the Chilly King Cooler to the Sanitary Dairy Supply Co., Central avenue, Los Angeles, who handle a full line of up-to-date dairy supplies and machinery.

"I am Going to Sell Out and Buy 160 Acres of—Milford Valley Land."

G. A. Halstead

The following letter was written by G. A. Halstead of Byron, Oklahoma, to his friend, Charles A. McClain of Whittier, Cal., upon the former's return to his home after having personally investigated the Milford Valley lands. Permission to publish this letter was obtained through the courtesy of both gentlemen.

Byron, Oklahoma, June 20, 1914.

Mr. Chas A. McClain, Whittier, Cal.

Dear Friend:—Arrived here all right, but find it very warm in Oklahoma.

I spent two days in Milford Valley. Covered practically the entire valley in an automobile. It is the best land and water proposition I have ever seen for the money. A man must see this project to fully appreciate it.

I went out on the new tract and saw land that had just been broken up five or six weeks. Saw fine stands of alfalfa and all other crops. Went to the old settlement adjoining this land and saw the finest grade of alfalfa in the west. In our party were two men from Imperial, one from Ventura, one from San Diego and a man from Los Angeles. We all agreed that this alfalfa would make two and one-half tons to the acre. We saw orchards loaded with apples, pears, plums, prunes, apricots, peaches, cherries—in fact all kinds of deciduous fruits. We saw pear trees forty years old without a sign of blight—and those old settlers really do not do anything except what they can perform on horseback.

Went to the great reservoir and found the irrigation system first-class. Thoroughly examined the soil and must say that I never saw anything better. If I can sell my farm I want 160 acres of Milford land. Very truly yours, G. A. HALSTEAD.

$30 an acre

Perpetual water right—$70 per share—12 years' time to pay for it if you desire.

On Main Line of Salt Lake Railroad, Adjoining Milford, Utah.

The above letter is similar to scores that have been written by enthusiastic purchasers of Milford Valley land. No matter where you are located—no matter how much money you are making, you'll be just as enthusiastic about Milford land when YOU see it.

The Milford project was designed for solid, substantial, successful men—the land is sold on a cash basis. This is the type of land that's easily worth $250 to $350 an acre when in alfalfa.

If you want the best land in the West for dairying, hog raising, deciduous fruit, potatoes, onions, celery, etc.—land that will produce a sure stand of alfalfa the first year — land that will produce $72 worth of alfalfa from three cuttings — $200 an acre from potatoes the first year—if you want to be part owner in a big gravity irrigation system supplying water at a cost that should not exceed 30 cents per acre per year — a safe, dependable system which you and your neighbors own outright for all time to come—if you want to live in a real mountain climate — the land of rosy-cheeked apples — where every breath of air is laden with health and vigor — where mere existence is a keen delight — where cheap land, cheap water and eager markets enable you to make money fast—go up on one of our excursions—at the homeseekers' rates and select your Milford land. Early buyers are gaining big advantages by locating close to the town of Milford.

Citriculture Class Afield

Dr. Coit's Class, This Year in Charge of I. J. Condit, Spends Several Weeks Visiting Orchards of the State and Each Member Gives Cultivator Readers His Principal Lesson from the Trip

THE SUMMER TRAVELING CLASS IN CITRICULTURE

By I. J. Condit

The work of the second annual summer traveling class in citriculture began at Fairoaks May 18 and ended at Santa Paula June 27, the first two weeks having been spent in the Sacramento Valley, the third week at the university farm at the time of the Fruit Growers' convention, and the last three weeks in the San Joaquin Valley and Southern California. The class is one of four which during about six weeks of the present summer have traveled in various sections of the state, visiting orchards, ranches, packing houses, canneries, vineyards, and nurseries, or studying soil conditions typical of California. As published in the prospectus of the college of agriculture "each student is required to take summer practice connected with his proposed major subject before beginning upon his junior year. The work is carried on as far as possible just as in actual practice. It is intended to give the student an insight into his future occupation. The credit given is six units. Expenses vary with the subject selected. At Davis the expenses for room, board and incidentals need not exceed $50 for a period of six weeks. In some subjects, railway fare and other incidentals of travel may bring the expense up to $150." The expenses for the class in citriculture averaged about $110.

The class this summer traveled over 1245 miles, visited 57 citrus orchards, 18 citrus packing houses, 12 nurseries, eight olive orchards, five olive mills, two fig orchards, two precooling and icing plants, one fertilizing works, and numerous pumping plants. Each of the students presented a full set of notes and some a set of photographs at the completion of the course; these are looked over, graded and returned to the student for future reference. Such notes, if properly taken and preserved, prove a fruitful source of information in later years and form the basis for intelligent experiments when the student leaves college and finds an opportunity to put the ideas into practice. The great diversity in the management of citrus orchards in the various sections visited proved the basis for long discussions by the members of the class; while an agreement was seldom reached as to the proper depth for plowing, the amount of water necessary, the best kind of fertilizer, the value of a soil mulch or the cause and control of mottled leaf, such discussions served to stimulate interest and to emphasize the need for conclusive experiments along such lines. The following brief extracts from notes taken on the trip will give some idea of the schedule and the kind of work done by the students. I shall simply call attention to particular or special features at each place, as space will not permit me to go into detail.

Two days were spent at Fairoaks in the orange groves, examining some experiments to control Armillaria and gummosis. Some time was spent in cleaning out crown gall from the roots of almond trees. An olive orchard infected with olive knot was examined and the habits of the disease noted. The orange packing house and the olive mill of the Fairoaks Fruit Company were visited and notes taken on the pickling of olives and the handling of the oil. One half day was spent in practice in pruning orange trees. One day was spent looking over the extensive nursery and plantings of the Natomas Consolidated Company, where a fine demonstration of blasting soil for tree planting was given.

At Oroville orchard surveys were made of a couple of olive orchards and five orange orchards. Comparative studies were made of the profits from olives and oranges in this district. Some time was spent in the plant of the Ehman Olive Company, which has 350 acres of olives in Butte County, mostly of the Mission variety.

The visit to the United States plant introduction gardens at Chico proved most interesting and instructive. Some 150,000 plants were propagated and distributed last year. Sixteen thousand species of plants have so far been handled at the gardens in the ten years of its existence. In such a collection of plants from all corners of the earth many interesting specimens were found and only a few could be studied; the Weber-Swingle citrus hybrids, the collection of fig varieties, avocado varieties, seedling almonds, peaches and nectarines were especially noted. Among the fruit trees found on the Bidwell ranch near Chico were many old chestnut trees as well as a small but very old orchard of filberts.

The Maywood Colony at Corning has 12,000 acres under cultivation, olives being most largely planted; other fruits in the order of their acreage are, prunes, peaches, apricots, almonds, pears, Smyrna figs and oranges. Two olive mills, those of the H. J. Heinz Company and the Maywood Packing Company, were visited and the methods studied. The Maywood Colony nursery at Richfield was established 19 years ago and has been propagating figs, olives, citrus trees, peaches and almonds.

Some practical experience in pruning was obtained at Orland, where one whole day was spent by the students in cutting out water sprouts, removing dead wood and shaping orange and lemon trees. Large plantings of olives, figs and citrus trees are now under way near Orland.

The extensive plantings of the Mills Orchard Company at Hamilton and Maxwell furnished a good opportunity to observe the methods of planting and of handling a young orchard. At Maxwell the company has already planted out 800 acres of Eureka lemon trees worked on pomelo root; these were transplanted with bare roots and set 24 feet apart on the contour.

The week spent at the Fruit Growers' convention at Davis proved a most profitable one for the students as it did for every one who attended. It gave them an opportunity not only to attend the meetings and listen to the addresses and discussions but also to get acquainted with the fruit growers and speakers and to obtain their views on some of the problems confronting the citrus growers in the various sections.

Traveling south from Davis the class first stopped at Fresno, where a morning was spent at the Markarian fig garden, which consists of 80 acres of Smyrnas and 80 acres of white Adriatics, which in all probability will be worked over to Smyrnas. Mr. Markarian hopes by using Ficus pseudocarica as a capri, to be able to pollinate the first crop of Smyrnas and thus save several tons of fruit which so far have been lost. A short time was also spent at the Kearney ranch studying olives and the effect of alkali on orange trees.

The next stop was at Lindsay, where the picking season was just about over. A visit to a small pomelo orchard showed conclusively that Tulare County can produce excellent fruit and that such fruit can be profitably marketed if its quality is demonstrated. Some careful work in tree surgery has been done near Lindsay on old lemon trunks with Valencia tops, and the future effect on the trees will furnish a good demonstration of the value of such work.

At Porterville one of the first orchards visited was that of Baird brothers, where 50 acres are being irrigated with an overhead sprinkling system so as to insure a uniform soaking over the entire grove. An auto trip towards the foothills showed to what extent the citrus industry is being developed, hundreds of acres of one and two-year old trees having already been developed, while other tracts were in the process of development.

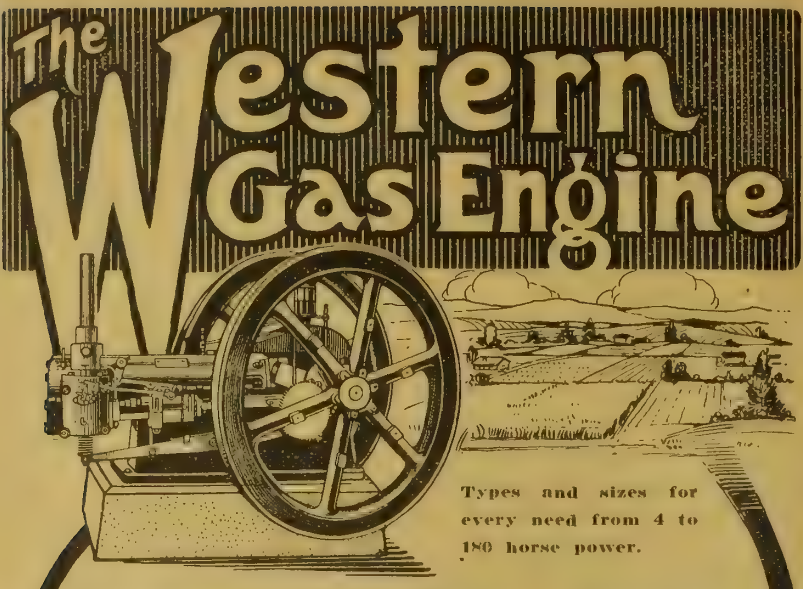
After a night of travel southwards the class stopped at San Bernardino, where the first day was spent in the Highlands district inspecting orchards and visiting packing houses. The following morning a visit was made to the Gate City Ice and Cold Storage Company plant to observe the methods of manufacturing ice and of precooling and icing cars. At Redlands in the afternoon the class studied carefully the basin-mulch system in use on a few orchards, the results of heavy pruning in an orange orchard, the Luffman system of cultivation, the condition of pruned and unpruned trees injured by the freeze and the contour system of planting.

An entire day was spent at the citrus experiment station, Riverside, studying the rootstock experiments, fertilizer plots, cover crops, orchard heater tests and varieties of citrus. The class enjoyed a two-hour session with Dr. Webber, who explained the future plans for the station and answered questions regarding the outlook for the industry, the proper methods of cultivation, the use of mulches in citrus orchards, the application of fertilizers, and the probable causes of mottled leaf.

Under the direction of Mr. Shamel a day's trip to Corona gave the class an opportunity to judge for themselves the value of bud selection and performance records. An experiment in growing an acre of lemons under a tent of tobacco cloth was interesting and seemed to be giving good results, so good in fact that other growers are considering the experiment on a much larger scale. The Flagler Fruit and Packing Company is one of the few in California which uses machine sizers successfully for lemons.

The proper management of a nursery and the growing of citrus trees was studied during the course of a day spent at the San Dimas Citrus Nurseries. Notes on seed bed work, budding, training, heading and transplanting were made while a couple of hours were spent in digging, balling and tying. At present the nursery is handling about 73 per cent of sour stock, 20 per cent of sweet and seven per cent of pomelo. Some excellent notes on the handling, packing and shipping of lemons were obtained at the San Dimas lemon house and a study was made of the equipment and handling of fruit in the orange house.

At Covina the overhead irrigation system proved an interesting study and some time was spent with an "Irish soil sampler" examining the condition of the soil in this and neighboring orchards. The use of buckwheat is quite general at Covina and many other parts of Southern Cali-



Types and sizes for every need from 4 to 180 horse power.

Cut Down Your Power Expense

You Can Use the Cheapest of Low Grade Fuel to Run the

WESTERN GAS ENGINE

Cheap fuel even to 38 gravity "tops" or "toppings" can be used efficiently and burnt cleanly. One-third of a cent per horse power per hour is all it costs to operate a Western when Special Gas Oil at 2¾c per gallon is used.

Discriminating Buyers Choose the Western

The design and construction is faultless. Many years of efficient and dependable power service have proven the true merit of the Western.

fornia; while it is giving fair satisfaction it seems desirable to find a leguminous crop which will grow well in summer and root more deeply than the buckwheat.

The pathological laboratory at Whittier was visited and examinations made of the experimental work on crown gall, nematodes and gummosis. An hour was also spent at the office of the United States fumigation investigatons, which has now been transferred to Pasadena. The first real notes on the avocado were obtained at the Magnolia Nursery, where many varieties are being propagated. In addition to the avocado some papayas and mangos have been planted on the higher ground where they show every indication of growing successfully.

A most profitable and interesting day was spent at the West India Gardens, Altadena, studying the avocado, sapote, feijoa, Queensland nut, mango, chayote, cherimoya, guava, persimmon, loquat and papaya: By way of diversion a trip was made in the afternoon to the Huntington estate, where ornamental plants and a five-acre orchard of feijoas were observed.

A good impression of the Orange County fruit districts was gained in an all day auto trip during which we visited the C. C. Chapman ranch at Fullerton, the orange and lemon packing houses at Villa Park, the new citrus plantings at Orange Heights, the C. P. Taft loquat, persimmon and avocado orchard, the original trees of the Sharpless, Monroe, Northrup, Taft, Senor and Rhoad avocados, and the Santa Ana mango.

A morning spent at Hollywood gave another opportunity to study the avocado. The original trees of the Harmon, Miller, Hathaway, Lyon, Royal, Challenge and Walker avocados were seen and notes taken as to the character of the fruit and the productiveness of the trees. The mango and cherimoya trees on the Keith place proved interesting. While in Los Angeles trips were also made to the Los Angeles Ice and Cold Storage Company plant, the American Olive Company mill, the Bradley Fertilizer Works and to the office of the Cultivator, where the students gained inside information as to the handling of an agricultural publication. The greater part of one afternoon was spent at the Exchange, where valuable notes were obtained regarding the operations of the Exchange, the Fruit Growers' Supply Company and the Citrus Protective League.

As a grand climax to the six weeks' trip two days were spent at Santa Paula visiting the Rancho Sespe and the Limoneira. The planting at the former ranch is already quite extensive, 350 acres having been set out during the past five years. Subsoiling 16 inches deep and cultivating ten inches is being practiced, the implements being drawn by a pony caterpillar. At the Limoneira some interesting experiments in mulching the entire surface of the ground are being carried on, bean straw, wood shavings and manure being used for a mulch. Extensive planting is being done on the contour, the land being terraced and trees planted on the edge of the terrace. There is practically no mottled leaf at Limoneira, but some of the trees show typical chlorosis which is seen to be quite distinct in color and form of leaf from the mottling.

In behalf of the students as well as the college of agriculture I wish to thank all those who in any way helped to make this second traveling class such a great success. I want to assure the growers that the students appreciate keenly the fine treatment accorded them in the various sections and hope that they will be able to reciprocate at some future date.

VARIOUS METHODS SEEMINGLY SUCCESSFUL

By Ralph G. Ainley

One of the things which has impressed me on this trip is that growers using quite different methods in their orchards are seemingly equally successful. One will advise deep plowing, another shallow; one uses stable manure for fertilizer, while another applies only commercial. Here is a grower using a cover crop and there one who does not. Overhead irrigation is considered best by a few while most use the furrowing method. Then again we meet a rancher who thinks straw mulching should be used with no cultivation in the summer, orchard should be plowed in the fall and planted to a cover crop for the winter. And so on down the list we find various methods in use, each one seemingly successful and satisfying the grower. This is apt to be confusing, but I believe the success in all cases is due to the fact that these groves are given good, consistent care, and as there are such a great number of different conditions of soil and location in the citrus districts of the state, each grower has to work out more or less for himself the practice which is best suited for his location and soil conditions. Of course there are certain principles which are established, but no section is typical of all, and methods good for one section may not be the best for another. The main point in all instances is to study the particular orchard and follow out conscientiously and systematically its care.

* * * *

INDIVIDUAL TREE RECORDS AND ORCHARD CHARTS

By A. L. Chaffin

During this trip I was anxious to find some way in which one might be able to increase the production of fruit per tree, and also produce fruit of superior quality and thus increase the production of our old bearing groves. From observations I noticed that the fruit growers getting the largest yields and also the best quality of fruit have some method of keeping records of the production and behavior of the trees.

By keeping individual tree records the grower is enabled to find out the amount of fruit each tree produces, and by careful observation he can estimate the quality of the fruit. From these two lessons he may be able to figure out why some trees are more profitable than others, and then force the inferior trees to produce more. This may also create an interest in every tree, and the result will be that every tree will soon be bearing a full crop every year. As soon as the grower realizes how many trees in his orchard are really paying him, and how many more there are that he is caring for at a loss, he certainly will adopt some method to make them all profitable. The poor trees which either produce an inferior fruit or are small producers should be worked over with buds taken from the best producers, or if the tree is not sound or has a poor root system it should be removed and a good tree put in its place.

If the grower has only an acre or two he may remember from year to year the behavior of each tree, but for larger areas a chart or plot system should be used. The individual grower may easily work out a practical system for keeping the tree records which will give him valuable information.

Following is a simple system some growers use in making a chart for keeping records. First: Each orchard is numbered; second, beginning from the same place in each orchard number the rows, and then from the same end of the row in each case number the trees in the row. Then on the base of each tree paint the numbers. The top number is the number of the orchard, the middle is the row number, and the bottom is the number of the tree in the row. Likewise, a chart may be drawn of the orchard, and the tree number placed on the chart the same as in the orchard.

When picking, the fruit of each tree should be kept separate, either weighed or the number of boxes recorded with a note of the quality of the fruit. This can be kept in a note book after the number of the tree; any time later the grower may refer to his chart and the figures and find out the behavior of each tree. From the chart it is easy to send out a man to any tree in any part of a grove that may need special care for gummosis, scaly bark, or gophers. Such a system can be applied to any orchard by any grower and at an exceedingly small expense as compared with the increased profits he is able to realize.

ORGANIC MATTER ON THE LAND

By H. L. Stambach, Jr.

The presence of an adequate amount of humus and organic matter is a manifest necessity for the thrift of orchard trees and the successful tillage of the orchard.

Dr. Lipman of the University of California tells us that by the present methods of orchard culture more humus is destroyed every year than is added to the land. He states that when a cover crop of vetch of ten tons of green matter, equivalent to two tons of dry matter, is plowed under in the spring and followed by the maintenance of a dust mulch in the summer, that more humus is burned out by the cultivation necessary to the latter than is added by the cover crop. As a remedy for this condition he advises that a mulch of straw or barnyard manure be substituted for that of dust; then the orchard would not be cultivated in the summer and would be irrigated in permanent furrows under the litter; the straw would be removed from the furrows at the time of irrigation. The condition which would result in the orchard from this treatment is compared to the favorable one under an old straw pile.

Mr. D. B. Macoun of the Mills Orchard Company at Maxwell solves the humus problem in an original way. He mows a mixed crop of barley and oats in the spring in his young lemon orchard. Under this curing straw he irrigates three times during the summer in ten inch furrows. Although his soil is rather heavy, it was found by our class to be in good physical condition with no plow sole. His duty of water is three miners inches to five acres. He plows in the fall. Mr. Macoun's trees are in good condition and he intends to use no commercial fertilizer, believing that his soil is rich enough for production if maintained in good condition.

Mr. Robert Thompson of Highlands has another method of going after the humus question. He took his orchard in charge when the trees had much mottle leaf and when an impenetrable plow sole was to be found six inches below the surface of the ground. He applied 30 tons of calcium carbonate to the acre and began to grow cover crops continuously throughout the year, a winter crop of vetch and two summer crops of buckwheat. He now applies 20 tons of lime to the acre every third year. He uses no barn yard manure, but makes heavy use of commercial forms. He uses much water. His trees when visited by our class seemed to be coming back into condition; we were able to work a King's soil tester five feet into the earth, finding moist dirt there.

Mr. Leffert of Redlands favored a system of continuous mulching. We found his trees in basins; these were filled with a straw mulch. The basins were of such size that they only included the ground under the drip of the trees. The land between the trees and outside of the basins is in alfalfa. Mr. Leffert states that a cultivating tool shall never again enter his orchard. His trees seemed to be in better condition than his neighbors and certainly had an excellent crop set; he had no plow sole.

RELATION OF QUALITY AND PROFIT IN THE ORANGE INDUSTRY.

By L. F. Durfy

During our recent trip through the citrus districts of the state I was greatly impressed by the fact that the profits received for oranges this year have been exceedingly small despite the fact that the crop has been as good if not better than the average.

The question as to the cause and remedy of the prevailing low prices is naturally of great importance to the grower, so it may be of interest to briefly summarize some of the facts concerning the present orange market.

In the first place the problems of increased competition, overproduction, etc., suggest themselves. It is undoubtedly true that the rapid increase in production of oranges in Florida, Cuba and the Isle of Pines has influenced to some extent the price of the California product, but investigation will show that this factor is only partially responsible for the present low returns.

The real cause seems to be one of a more or less temporary nature due to the setback given the California industry by the freeze and the consequent advantage gained by the Florida product. Immediately following the freeze it was almost impossible to completely separate the good oranges from the frozen and as a result considerable fruit of poor quality was placed on the market. This naturally injured the reputation of California oranges and gave Florida fruit the preference on many eastern markets.

In order that California oranges may regain their position in the market it is up to the producer to put out a fruit of a uniformly high quality. If he can maintain a reliable standard there should be little fear of competition, for it is generally conceded that the California navel is far superior to the oranges of other countries.

Another factor which has no doubt lessened the demand for California oranges is the practice in some sections of the state of shipping immature fruit. An illustration will serve to emphasize the point. In one of the orange districts north of the Tehachapi certain growers, not members of the association, sold their fruit to dealers who came in as early as October, picked the fruit while still green, sweated and shipped it to eastern markets where they received good prices for the early shipments. The association members, on the other hand, allowed their oranges to remain on the tree until sufficiently mature, but when it arrived on the eastern markets there was practically no sale for it because the green fruit, shipped previously, had killed the demand for oranges from that locality.

As a suggested remedy for the green orange problem, would it not be to the interest of the growers to cooperate and agree to hold their fruit until sufficiently ripe? By shipping the oranges for the Christmas market, instead of striving to get them all off before Thanksgiving, they would still be ahead of the Southern California crop and at the same time would be marketing a product of better quality than at present, which would mean, naturally, better prices and larger profits.

From the above instances we see how important a part quality plays in the orange market and that better prices can be obtained by the establishment and maintenance of a more uniform standard. This is being done to a large extent through the excellent work of the exchange and the more efficient methods being adopted by growers and packers. If the producer will back up this movement he may soon expect a more satisfactory income.

CITRUS DISTRICTS IN CALIFORNIA

By L. E. Thomas

That the citrus industry of California is in three sections, each at a different stage of development, is apparent to anyone who looks into the situation at all carefully. These three sections may be classed as the fully matured and most prominent section of the south; the young though well developed section of Tulare County, and the new and promising section of the northern Sacramento valley.

Of the south little needs to be said. People around the world are acquainted with what has been done there with the citrus industry. And with the same characteristic vigor

One-Third More for Tires

16 makes of tires now sell for more than Goodyear prices. Half of them cost about one-third more. As compared with them, Goodyears save you 25 per cent in original cost alone.

Don't Pay It

Don't pay those extra prices. The evidence is that Goodyear tires are the best tires built today. They outsell any other, and they won that place by millions of mileage tests.

No man knows how to build a tire to give you lower cost per mile. No other maker combats tire troubles as we do in Goodyear tires.

Any higher price means added cost of upkeep without any compensation. In most cases, that higher price is due to limited production.

Save This 25%

We used to charge you extra prices for Goodyear No-Rim-Cut tires. That was because of exclusive, costly features.

Those tires are built the same today. They have the same exclusive features. But we now build ten tires where we then built one. We have modern equipment, new factory efficiency. Our prices came down as our costs came down. They are half what they used to be.

Accept this saving. It is one of our greatest accomplishments. The price of the leading tire of the world is all that you should pay.

Exclusive Features

These four features of No-Rim-Cut tires are found in no others at any price:

Our No-Rim-Cut feature, which wipes out rim-cutting completely.

Our "On-Air" cure, which saves all the countless blow-outs due to wrinkled fabric. This one exclusive feature adds to our tire cost $1,500 daily.

Our patent method for combating tread separation. It reduces this danger by 60 per cent.

Our All-Weather tread—our double-thick, resistless anti-skid which, because of its flatness, runs as smoothly as a plain tread.

Note that these are all exclusive Goodyear features. No other tire offers one of them. Every year they are saving our tire users many millions of dollars.

You will get them all, at the Goodyear price, if you ask your dealer for No-Rim-Cut tires. Any dealer can get them quickly if your size is not in stock.

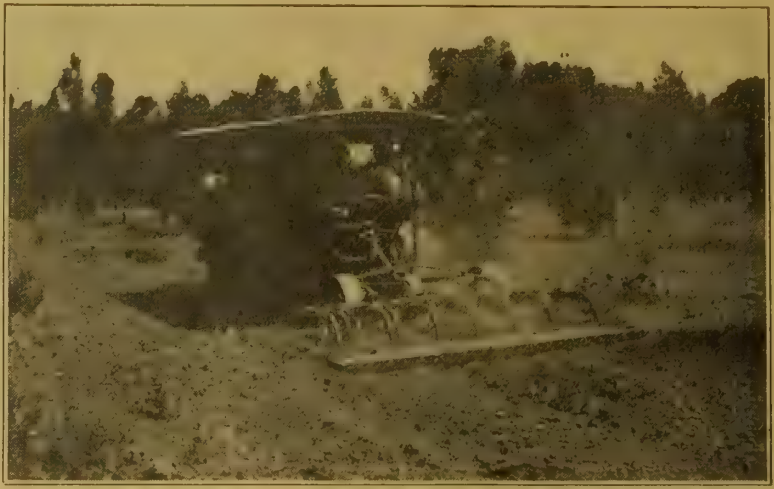
much is yet to be expected. Land is high in price, water expensive and crop pests very numerous. This is to be expected in a country so long given to one main crop. The climate with the social development make it the most charming of the three districts in which to live.

The Tulare district is generally speaking about ten years old. This makes it easy to predict what its possibilities as a citrus district are. Land is a trifle cheaper than in the south; water perhaps less expensive and crop pests are not so numerous. Plantings for the last six years or so have been at the rate of 3,000 acres per year in Tulare County. There is much land yet to be planted. Aside from the high summer temperatures the climate is most desirable.

The true northern Sacramento Valley district is the one so little known or understood. On the east side of the valley in the Oroville district there are some fairly good groves. The better soil is to be found on the west side of the valley, extending from Tehama on the north to Arbuckle on the south, a distance of about 75 miles. There are but a few citrus groves here, but the whole district is open to citrus planting with safety. The soil is generally good, water by pumping abundant at easy lifts and prices of land about the most reasonable of any in California. This then is the most promising district for future development.

The important questions as to yields, quality of fruit and frost conditions of this district have been carefully considered. On the authority of specialists and those most qualified of any in the state to answer these items we have the following opinions. Yields per acre will equal those of southern groves under the same conditions if the same good management, care and wisdom is used. The quality of fruit is on a par with the best that can be produced in the south, if the fruit is allowed to properly ripen. The period of ripening is from four to six weeks ahead of the same period in the south. As to frost the district is thought to be equally as safe as the southern citrus district.



A Ventura County Iron Mule Doing Thorough and Deep Work

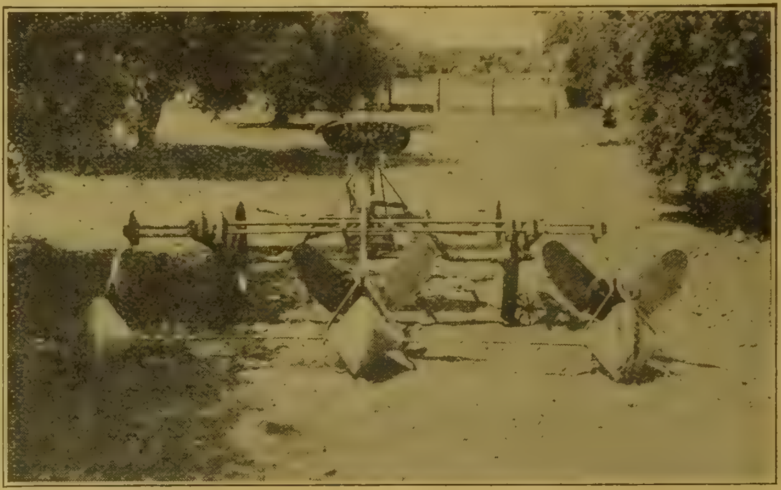
Climatic conditions are about the same as those in the Tulare district, being hot in the summer months. With the added possibilities for future development and present favorable circumstances for making a start the advice to anyone contemplating the raising of citrus fruits is to first investigate this northern Sacramento valley district before settling elsewhere.

* * * *

IMPROVE ORCHARD IMPLEMENTS

By Harry Sargent

Mr. A talks about orchard fertility. Mr. B about studying your local conditions, but who ever dreams of improving the orchard implements? First, be sure and purchase the simplest and most efficient machinery possible, second, study your implements and note the experiences of your neighbors so as to perfect those implements you already possess.



Appliance for Crushing Clods and Smoothing Irrigation Furrows

Cultivation is termed necesary by all leading orchardists in order to keep the soil in the best physical condition. This may be accomplished in numerous ways, but the best are none too good.

One hundred and sixty acres of fruit should support a tractor to do the cultivating, sub-soiling and heavy hauling. And when extensive ditching or underground flume work is to be done a caterpillar ditch digger which will dig 4,000 feet of three-foot trench per day is comparatively inexpensive and very useful. The average orchard in this state is too small to support such extensive machinery as mentioned above, and in these cases the horse implements are the only solution.

A circular harrow is of great importance as it leaves the weeds and trash out at one side and easily works up near the body of the tree.

The horse cultivator should be purchased with great care, as our markets are swamped with useless implements. Some are better adapted to certain sections of the state than others and the best can only be chosen after very careful study. The doubletrees should be short so as not to injure the trees. All perpendicular levers are useless; it should be built low. If cultivation underneath the tree is desired, a horse cultivator may be devised by which the man and horse are set out at one side, permitting the plow to go under the tree.

Heavy soil is very difficult to get into shape for irrigation so that some kind of a clod crusher attachment (made of concrete or iron or other heavy material) is advisable to use behind the marker. If the soil is too loose a piece of metal may be fastened to the beam just above the marking share to prevent the soil from rolling over the share and filling up the furrow.

A piece of rubber hose, boot, or auto tire, may be easily attached to that part of the various implements to prevent severe searing of the trees. A round piece of wood, such as a wooden wheel to a toy wagon, may be rimmed and the top covered with rubber and attached to the outer end of the cultivator or harrow with great success If this is not possible a rod may be attached with one end to the outer end of the beam and the other to the doubletrees or draw chain and this wrapped with rubber.

All trees should be balled with longer tap roots than has been practiced of late, and this may be done very easily and rapidly by use of a spade with a very long blade.

Sub-soilers should be constructed of the very best steel of considerable thickness. If such implements are not on the market have them made to order, as it will save time, labor and expense.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Fence Over Line

How can I make my neighbor move his fence? It is 10 feet over on my line. Was put up four years ago. I have the two corners. Must I have it surveyed again or can I measure it and make him move If I have to survey can I make him pay for it?—Subscriber, Haywards.

If your neighbor will not join with you in a friendly effort to locate the division line and agree upon the same, it will be necessary for you to bring suit against him to quiet title to the 10-foot strip in dispute. Your lawyer in that case would have to decide whether or not the evidence you mention is all he would wish to establish in court your division line in the place where you think it is; it would seem sufficient to me if you can locate one of the corners according to the record and survey from that, either yourself or with the aid of a regular surveyor. If you are obliged to survey you cannot compel your neighbor to pay for it.

Figuring Time

A rents a team of mules from B, agreeing to pay him $20 per month and board. A receives mules on January 30 and turns them back on April 17. B claims that A owes him rent for two months and 19 days. A says he owes him for only two months and 17 days. A claims that from January 30 until March is one month. B says it is one month and two days. Who is right?—Subscriber.

The word month when used in commercial transactions means a calendar month unless otherwise specified in the contract. If A received the mules on the morning of the 30th in time to use them all day, that would be figured one day, January 31 would be two days, February and March would each constitute a month, making two months, and if the mules were used all day of April 17 the total aggregate time would be two months and 19 days. If the parties care to figure the matter very accurately they have the right to figure fractions of a day. Thirty days is arbitrarily used in figuring fraction of a month.

We note in an exchange complaint that many eastern florists have raised the price on flowers, especially at Decoration Day, to such an extent as to necessitate the purchase of metal and everlasting wreaths. It has been a common practice with florists to secure the announcement through papers some time in advance of a special demand that there was a great scarcity of flowers, this to induce a scramble, or early orders, and enable them to secure long prices. While this has been accomplished to a certain extent, the practice has caused patrons to order vast quantities of manufactured stuff, and tons of fine natural flowers have rotted for want of purchasers. No matter what the product may be the public will not stand for these practices.

CITRUS TREES

Buy from the largest Citrus Nurseries in the World

—and know what you are planting. Teague trees are better than others because scientifically grown. They are started right, grown right and shipped right. Ask for quotations.

We can supply all the STANDARD SORTS in almost any quantity—

Deciduous Fruit Culture

THE DROPPING OF FRUIT

Written for the California Cultivator
By Albert M. Paul

During the recent Fruit Growers' convention at Davis there was passed a resolution, the object of which was to seek information leading to the causes of the excessive dropping of fruit this year.

In the course of our work we have recently made investigation into this matter for Mr. George H. Cutter, president of the California Fruit Exchange. The results, which Mr. Cutter kindly permits us to use, while not absolutely conclusive, nevertheless give valuable data and lead to at least one possible solution of the problem. Cutter Brothers own and operate a well managed, productive peach, pear and plum orchard on the American River bottom lands, east of Sacramento. In common with other orchards examined by us this season, a considerable amount of dropped fruit was evident on this property in spite of good care and attention. Our investigation brought together evidence which indicates that in this case the dropping of fruit was due, at least in great part, to the lack of sufficient available nitrogen at the time when the tree was making its greatest draft on this resource.

Now, though this dropping of fruit was due to a deficiency of available nitrogen, this deficiency was indirectly traceable to climatic conditions. Our analysis of the soil showed it to contain a sufficient amount of total nitrogen to produce a crop under normal climatic conditions, but there was far from sufficient available nitrogen to balance the retarding influence of this spring's excessive moisture.

This condition was investigated by us on April 24 of this year, at which time soil samples were taken to a depth of six feet, and, upon analysis, the soil shown to contain an average amount of but 34 pounds per acre of available nitrogen in the form of nitrates. When one considers that the peach tree in producing its normal crop removes from the soil approximately 84 pounds of nitrogen per acre per year, it is readily seen that without additional supply from one source or another the tree is bound to suffer. It is a well known fact that the tree draws most heavily upon this valuable resource during the setting of the fruit and later during the formation and development of buds for the following year's use.

Furthermore, we know that aside from the soil's natural fertility it may have three additional sources of nitrogen supply upon which to draw, viz: Artificial application of nitrogenous fertilizer of the commercial variety; the turning under of green manure; nitrogen obtained from the air through the agency of nitrifying bacteria.

While there remains much to be learned about soil bacteria which affect nitrogen yet we do know that they may be roughly divided into two classes, i. e., beneficial or nitrifying bacteria and harmful or denitrifying bacteria. The former actually produce nitrogen in a form available for plant consumption, while the latter destroy this valuable plant food. Still another point which has been well established with reference to these minute organisms is the condition under which each thrives. The harmful or nitrogen destroying variety, as borne out by our investigations, thrives only in excessively wet, cold, poorly drained or acid soil, while the beneficial bacteria thrive only in well drained, warm, sweet soil and must have plenty of air from which the resultant nitrogen supply is derived.

Had this spring, particularly at the time of the setting of the fruit, been a warm, open season, instead of an unusually wet one, the conditions controlling nitrification by bacterial action would have been reversed. And had there been an abundance of nitrates in the soil, i. e., a sufficient amount to overbalance this retarding influence exerted by the prevailing climatic conditions, the evil effect would not have been evident.

In order to show the great value to the soil of bacterial activity the following is of interest. In one gram of the Cutter soil there were approximately 100 million bacteria weighing about one-tenth of one milligram. This would give for each acre of soil to a depth of two feet 800 pounds of living bacteria. The volume of carbon dioxide evolved by these bacteria through the decomposition of organic matter may reach a volume per year of 3000 cubic yards. This gas, spread over the surface of any acre, would cover it approximately 22 inches deep. From these figures one can readily see that such bacterial activity is by no means to be neglected, and that where it is interfered with by seasonal conditions the fertility of a soil with a small margin of nitrate present, may readily become very much impaired.

Our investigations thus lead us to conclude that if dropping of fruit is to be avoided, in as much as we can not be independent of climatic conditions, the grower must see to it that his trees are sufficiently well supplied with nitrogen to overbalance any retarding influence an excessively wet season may have upon the bacterial activity which would take place under normal conditions.

DON'T SHIP GREEN GRAPES

The state board of viticultural commissioners has issued a bulletin warning against shipment of immature grapes. The bulletin says in part:

"To the Growers, Packers and Shippers of California Table Grapes:

"Let us have your hearty cooperation this year and at once in the matter of an attempt to better our table grape markets in the United States and Canada the coming harvest season.

"The viticultural commission of California believes, after thorough investigation, that hasty shipments of unripe table grapes into the Eastern markets are doing us an injury in returns to the extent of $500,000 per annum.

"Let us get together this season and stop the practice. We advise that no table grapes be picked and packed until they test 17 per cent in sugar.

"The Western Fruit Jobbers' Association of America is with us in this effort, and promises fullest support. The California handlers of our grapes are agreed that the movement is right and will be productive of good results.

"Let us all show that legislation will not be required to make us do what is for our own good and for California's reputation as the state producing the best table grapes in the world.

"The crop is big. Estimates indicate that it may reach a total of 8,000 carloads, or nearly 2,000 more than went east last year, in the event that damage does not come to the crop between now and the harvest season.

"Notwithtanding this condition, the markets should be good if we are careful of what we send. The deciduous fruit of the East and North, which in a measure competes with our exports from California, is not up to normal. In the North, pears, at the present writing, are not 60 per cent of last year's crop. Italian prunes are scarcely one-third of a normal crop. Peaches are good and the apple crop immense.

"In the East, Georgia expected 5,000 cars of peaches and will not have over 3,000. New York state and Connecticut had 5,000 cars to ship last year, and their crop is a failure this year. They will not have enough for local use. These crops do not come into the markets in vigorous competition with our grapes, but the shortage is a factor in general marketing conditions in the East this year.

"The first table grapes left Imperial Valley in June, and everything points to the use of utmost care in the matter of picking at the proper time when the sugar content is sufficient.

The Western Fruit Jobbers' Association of America at their annual convention in Kansas City, last February, adopted the following resolution:

"Resolved, That we, the Western Fruit Jobbers' Association, in convention assembled this sixth day of February, 1914, do proclaim that we are in hearty accord with the work of the viticultural commission of California, and will do everything in our power to cooperate with the commission in an honest and earnest endeavor to have abolished entirely the practice of shipping green and unripe table grapes out of the state of California and into the hands of the members of our association.' "

"This means that the shipping companies handling the table grape crop in California, and the distributors receiving our carloads in the eastern centers, are a unit in favor of the establishment of a minimum sugar standard for our grapes, and will cooperate with us to that end.

It is claimed by one firm, enthusiastic over the effort we are making, that $500,000 would be the additional yield of the table grape crop if there were a strict regulation enforced at the shipping point so far as the sugar content of the grape is concerned. One distributing house aptly describes the unfortunate result of hastily harvesting and shipping by declaring that the first grapes have left 'a sour taste in the consumers' mouths,' and that they shy away from California grapes for two or three weeks, thus hurting the market when the grapes are in thoroughly good condition. Skepticism has, therefore, spoiled the market for worthy offerings that come later.

"The membership of the Western Fruit Jobbers' Association includes practically every fruit shipping concern in this state and most all of the eastern distributors of our table grapes and deciduous fruits. Therefore, we have gained one big point in our attempt, and all that we need now is the support of our vineyardists who grow these table grapes.

"The grapes that are most apt to mislead the consumer are those of green cast. The yellow tinge when the berries are well along in sugar is overlooked, and the consumer will bite into the grape believing it is in condition to eat. He will find that it is very sour, and that will be the end of his grape buying for several days. Necessarily this experience puts a damper on the consumption and the market for a certain period of time, during which other grapes may arrive in the same market in very good condition. The demand ceases temporarily on these better grapes, and the shippers who forward them experience poor results.

"Not so much trouble is experienced with grapes that show some touch of color when they are nearing the ripening period. This is particularly true of the Tokay; although it is also a fact that in some of the southern districts of the state the Tokays are well along in sugar before they show the flame, or red color. In the south we find the Tokay grapes with scarcely any color at all even when they are quite ripe; while in the north, in the Sacramento and San Joaquin valleys, the reddish tinge appears early. As said before, however, the Malaga, Muscat, Thompson's seedless and other varieties of the greenish cast are the ones that are most apt to deceive the consumer.

"The viticultural commission believes that table grapes should not be offered for sale until they have attained at least 17 per cent in sugar."

APPLE SHOW

The big apple show heretofore held at Watsonville will this year be at San Francisco, October 1-11. The management will erect three tents at Market and Eighth Streets, and expects to obtain wider publicity for apples and apple products than is possible at a home show.

Of the 30 apple producing counties in California, seven already have accepted Watsonville's invitation to take part in the fifth annual show. San Diego was the first county to respond and will reproduce in apples a large section of the 1915 San Diego Exposition. Other counties which will send the finest apples their trees can be persuaded to bear are Monterey, Inyo, Napa and San Bernardino, including the Victor Valley apple district, which took many prizes at the show in Watsonville last year. "I am more than pleased at the way the replies to our invitation have come in," said Manager Perkins. "Every one of the counties accepting our invitation to exhibit not only is enthusiastic over the Watsonville enterprise which brought the big show to San Francisco this year, but is planning to make larger and more beautiful exhibitions than ever before. In fact, I feel certain that the October show will be the most beautiful fruit exhibition ever held. The value of beauty is being emphasized, and we are offering special awards for the most attractive feature displays."

"CARRYING ON" THE BUSINESS

"I understand that you and your son are carrying on the ranch business together," remarked Mr. Homespun. "Yes," Mr. Rangely replied sadly. "I look after the business and he does the carrying on."

FORAGE CROP YIELDS 100 TONS TO THE ACRE

Will grow on arid and semi-arid lands, without irrigation.

One acre planted to this new forage plant will keep from two to four dairy cows in good condition. It is said to be the greatest milk producer of all forage plants. As a fattener for beef, forage plants. As a fattener for beef cattle and hogs, it is claimed that this new forage plant has no equal. Many claim that it will lower the cost of living, by lessening the cost of producing such staple articles of diet as beef, butter and bacon.

The plant referred to is none other than the Luther Burbank Spineless Cactus. A booklet has recently been compiled which contains a lot of valuable information about Cactus, and which shows the results of a number of feeding tests. If you will write to the El Campo Company, Dept. C, 211 Story Building, Los Angeles, Calif., a copy of the booklet will be mailed to you free.

BURBANK'S SPINELESS CACTUS

Absolutely genuine. You can make big profits from this wonderful plant.

Ideal hog and cattle feed.

Write for illustrated pamphlet.

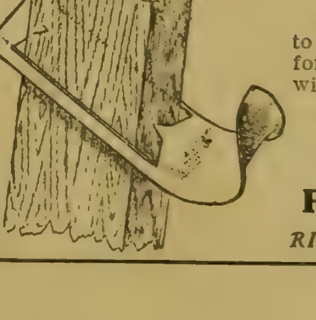
Our prices are attractive.

TRUMBULL SEED COMPANY

257 Market Street
San Francisco

The McIntyre Tree Prop Brackets

Are the Best Made



Have a smooth, rounded surface for the limb to rest upon. Strong, well made and will last for years. Will not chafe the tree like the wire brackets.

SAMPLE and PRICES
SENT UPON REQUEST

Manufactured by

PARKER MACHINE WORKS

RIVERSIDE, - - - CALIFORNIA

Get Your Canadian Home *from the* Canadian Pacific

The Home Maker

BUY an irrigated farm where you have insurance against drought and where you have just the moisture you need *when you need it*. You know the value of controlling the watering of your crops. In sunny Southern Alberta you are master of the moisture. The Canadian Pacific's great Irrigation Works *insure* your yield whenever rainfall is insufficient. Irrigation is not always a necessity—but it is yours at command. It means dependable crops, and wonderful crops every year. The Eastern section of the Canadian Pacific Irrigation Block East of Calgary is now open. Virgin soil of famous fertility—alfalfa, timothy and other fodders—raises all the grain and root crops, fine climate—great cattle country—good markets—unexcelled transportation.

We want the alert enterprising farmers who see this magnificent opportunity. So we make the most liberal terms. Take 20 years to pay. Call on us for long time loan of $2000 for farm improvements if you want it. Investigate now. This block will soon be the most densely populated and intensely cultivated district in the west.

You Can Have 20 Years to Pay

We will sell you this rich, irrigated, Canadian land for $35 to $75 an acre. You need pay only one-twentieth down. Think of it—only one-twentieth down, and then the balance in 19 equal annual payments. Long before your final payment comes due, your farm will have paid for itself over and over again. Many good farmers in Western Canada have paid for their farms with one crop. Here are some of the startling features of the most remarkable land offer you have ever read:

We Lend You $2,000 for Farm Improvements This offer of a loan up to $2.000 is for farm development only, with no other security than the land itself, and shows our confidence in the fertility of the soil and in your ability to make it produce prosperity for you and traffic for our lines. This loan will help you in providing buildings, fencing, sinking well and breaking, and you are given twenty years in which to fully repay this loan. While enjoying the use of this money, you pay interest at only 6%.

Advance Live Stock on Loan Basis The Company, in case of the approved land purchaser who is in a position and has the ability to take care of his stock, will advance cattle, sheep and hogs up to the value of $1,000 on the basis of the settler's note with interest at eight per cent, to enable him to develop more rapidly, on the right basis of mixed farming.

Farm Made Ready by Experts if Desired If you want a place already established, select one which our Department of Agricultural Experts has developed. On our improved farms, house and other buildings are up, well is dug, farm fenced, fields cultivated and in crop. All waiting for those who want an immediate start and quick results—all planned and completed by men who know our own agricultural experts. Take twenty years to pay if you want to. We give *free* service—expert service—the valuable assistance of great demonstration farms, in charge of agricultural specialists employed by the Canadian Pacific for its own farms. This service is *yours*—free

IRRIGATION FARMING IN ALBERTA

Water Rental Will Not Exceed $1.25 per Acre Each water agreement will have approval of Dominion Government. Lands are located on or near established lines of railway. First payment of irrigated land is 1-20th of purchase price. At end of first year no payment is due on principal or water rental, only payment of interest is required. At end of second year, no payment of principal is required, but purchaser will be required to pay interest and water rental. At end of third year, the second payment of principal, interest and water rental will be required.

Here is where your opportunity lies. Don't delay. Mail coupon here at once. Best land will be taken first—time is precious to you. Write today

This Engine Supplying Power FOR This Pump

DISTILLATE ENGINE Z-S

AMERICAN CENTRIFUGAL PUMPS

insures you the most water for the least power. If you are interested in irrigation, come in and see us. Hundreds in use. Let us refer you to people right in your own section who are using them.

AMERICAN PUMP COMPANY
131 No. Los Angeles St., Los Angeles, Cal.

WATER PIPE

ALL SIZES

Hot asphaltum dipped, new threads and couplings; 2nd-hand in name only. Prices far below your expectations. Screw casing and standard pipe fittings and valves.
The Exclusive Pipe House.

PACIFIC PIPE CO. **Main and Howard Sts., San Francisco**

Spineless Cactus HAVE YOU SEEN IT GROW? HAVE YOU SEEN IT FED?

One dairyman near Los Angeles produced over 40 tons off one acre first year. Owing to demand for plants he can sell them for a handsome profit. Will you be the first to demonstrate its growth and value in your community?

For further particulars concerning genuine Burbank varieties address Wm. W. Shigley, Suite 228-9, 702 So. Spring St., Los Angeles, Cal.

Occurrence of Frosts and Freezes

Historical Cold Periods in California and Florida Described by Mr. Carl Nichols

This is the season of the year when there should be the greatest interest in the discussion of frost protection. It is the season when orders should be placed for appliances and supplies and when care should be taken of appliances already in the orchard or storehouse. Large investments have been made in frost protection. During the 365 days of the year it is probable the appliances will not be used more than four or five, but the necessity for having them in perfect working order is just as great as if they were to be used daily. A bit of carelessness at this period of the year might mean the entire loss of the orange or lemon crop. Are the fire pots coated to protect from rust? Are the cans, the tanks, the reservoirs kept in hand so there is no leakage of fuel? These questions will afford opportunity for discussion during the next few weeks. As a preliminary article we are glad to give the following from the thesis prepared by Mr. Carl Nichols when he was a student in the state university. The entire investigation of Mr. Nichols is reported in some 200 pages of manuscript, and of course we cannot give it all. The portion touching upon recorded frosts which we publish this week is most interesting. Later we will quote from other and perhaps more practical portions of Mr. Nichols' manuscript.

Historical Cold Periods

In Blodget's Climatology, published in 1857, we find mention of a cold period as early as 1748, which caused considerable damage to the tropical fruits of the South. Again in January, 1766, frost destroyed all tropical fruits, except oranges, in Northern Florida, a minimum temperature of 26 degrees F. being recorded on the St. Johns river. In 1780 a severe cold wave swept over the country, this being one of the worst known in the entire history of the land. In 1800 another period of excessive cold was experienced in the southern states. Severe storms of sleet and snow occurred in Louisiana, and in January, 1800, a heavy snow fell in New Orleans, with general and severe injury to tropical fruits and tender growths.

Of the freezes usually spoken of as "the great freezes," the first occurred on February 7 and 8, 1835. Tropical fruits were killed which had been uninjured for more than half a century. On the St. Johns river, five miles from Jacksonville, Florida, evergreen oaks shed their leaves from the frost; orange trees were split to the ground and killed, roots and all, at St. Augustine and Mandarin, some of these trees being 40 or 50 years old. The thermometer at Jacksonville, it is said, fell to eight degrees F.

In January, 1852, snow fell at Charleston and Jacksonville. At Charleston thick ice formed for several days, and many orange trees were killed. Again in March, 1876, destructive frosts visited the gulf states, killing orange and other fruit trees in northern Florida. In 1882 a severe cold period was experienced in California, a minimum of 21 degrees F. being registered at Fresno. Ice was formed in Los Angeles and the surrounding hills were covered with snow.

The second "great freeze" in Florida came on January 12, 1886. The lowest temperature for many years was felt in the South, with resulting great losses to agricultural and fruit growing interests. In Florida the estimated damage to crops was $3,000,000. Most of the orange crops were destroyed, young orange trees were killed and old trees were frozen back to a considerable extent. It is worthy of notice, however, that the damage was mostly repaired by the following season, when the crop was larger than ever before.

In January, 1888, the temperatures on the Pacific coast were the lowest which had ever been recorded; killing frosts occurred and ice formed as far south as San Diego. Again in 1891 a cold wave appeared on the Pacific coast, injuring oranges and nursery stock in California and Arizona. Ice one-half inch thick formed in shallow pools about San Diego, and in Mission Valley oranges were frozen badly.

The third "great freeze" of the Florida citrus regions came in the winter of 1894-95. To be accurate, there were two distinct cold waves, the first appearing during the latter part of December, 1894, and the second during the early part of January, 1895. Injury to the fruit industry was very great, oranges, lemons and many other tropical trees being killed to the ground. Only in the extreme northern portion of the state, on the keys, and in certain well protected districts in the central portion of the peninsula, did the trees escape with but little injury. In fact latitude was found to be the only modifying influence of importance, the blizzards as they swept southward gradually decreasing in severity.

The first great blizzard, commencing on December 27, 1894, reached its climax on the 29th when the temperature fell to 14 degrees F. at Jacksonville, one degree lower than during the great freeze of January 12, 1886. A strong wind, accompanying the lower temperatures, attained a maximum velocity of 25 to 30 miles per hour. Killing frosts occurred for three days in succession throughout the northern and central parts of the state. The weather following this first freeze was clear and comparatively cold for several days.

Fine growing weather preceded the second freeze for a period of two weeks, the night temperature not falling much below 50 degrees and the day temperature rising as high as 80 degrees. This resulted in a rapid growth of new wood on injured citrus trees. On February 7th, when the second freeze commenced, the new growth had reached a length of one to four inches. Flower buds were forming and the growers were much elated that the trees had shown such marked resistance to low temperatures. With such conditions prevailing before the freeze the temperature fell to 14 degrees on the morning of February 8th at Jacksonville; the temperature throughout the orange belt generally ranged from 15 degrees to 19 degrees. As a result many of the trees, now stripped of their normal dense foliage, were unprotected from the cold blast and were killed to the ground, young and old alike. The second freeze, like the first, was accompanied by a strong wind with a maximum velocity of 30 to 35 miles an hour. On February 8 and 9 snow and sleet fell in various parts of the northern and central sections of the state. The weather after this freeze was cold and clear for several days.

It is worthy of note that these two freezes showed but slightly lower temperatures than those of 1886. Consequently neither alone would have done much more damage than the latter freeze; the extremely disastrous effects were due to the fact that the freezes occurred so close together.

In December, 1895, severe frosts occurred in Southern California, injuring nearly 50 per cent of the orange crop. The frosts of this month caused great interest to be taken in frost prevention devices, and numerous experiments were started by the Riverside Horticultural Club, in cooperation with the United States weather bureau, to determine the relative values of such devices as were then known.

In February, 1899, one of the most remarkable cold waves in the history of the weather bureau traversed the United States from the North Pacific to the South Atlantic, damaging crops to the extent of millions of dollars. At Jacksonville, Florida, a minimum of 10 degrees was registered during this freeze. In Southern California much damage was done to citrus fruits. It was during this cold period that 150 acres of lemons on the great Limoneira ranch in Ventura County were frozen back to the trunks.

In December, 1911, a disastrous cold period extended over Southern California from the 19th to the 20th, the cold culminating on the night of the 26th, when a maximum temperature of 19 degrees F. was recorded at San Bernardino. This freeze resulted in a loss of about $5,000,000 to the citrus industry.

In January, 1913, the most severe cold spell passed over California that had been experienced since January, 1888, and in the southern part of the state the temperature was lower than had been known for a period of 60 years. Heavy frosts occurred on January 4, 5, 6, 7 and 8. Strong winds preceding the frosts came from the north-northwest rather than, as usually happens, from the north-northeast. The wind began to blow shortly after noon on January 4 and continued until 3 a. m. on January 6. Instead of the usual draft through the Cajon Pass at an elevation of 3823 feet, the winds came directly over the Sierra Madre range, whose elevations exceed 6000 feet. During the midday hours on the 4th, 5th and 6th the temperature did not rise much above 50 degrees F., and in some places did not reach 50 degrees F.; that is, it was 30 degrees lower than the normal midday temperature. Apparently the whole mass of air to an elevation of several thousand feet was at a low temperature. The wind was extremely dry.

During this freeze the fruit was subjected to temperatures below freezing for four successive periods, averaging four hours for the first, 13 hours for the second, 13 hours for the third, and nine hours for the fourth; in all, during a total period of 72 hours, during which under normal conditions the plants would have received a supply of heat approximately represented by 1500 hour-degrees, starting from a temperature of 40 degrees F., they only received 220 hour-degrees. There were 170 hour-degrees below freezing, and of these 50 were below 25 degrees F. In a general way there were 30 hours when the temperature was below freezing; 12 hours when it fell as low as 25 degrees F., and two hours when the temperature did not exceed 20 degrees F.

Minimum temperatures of 13 degrees F. were recorded at Escondido; 16 degrees F. at Chino; 17 degrees F. at Pomona; 18 degrees F. at Redlands and San Bernardino; 21 degrees F. at Riverside and Pasadena; 25 degrees F. at San Diego.

Season of Frost in California

With citrus fruits the frosts of December, January and February are the ones to be most guarded against, as then a large part of the crop is ripe and ready for shipment. With deciduous fruits the late spring frosts do the most damage. Almonds, apricots, grapes, peaches and prunes are hurt while in bud or while the fruit is just setting by the frosts of March and April. The damage probably depends as much, or more, upon the condition of the tree as upon the degree of cold. Often a sharp frost during the first part of April does less damage if the trees are fairly past the blooming period than the same frost would have caused had it occurred about the middle of March.

The following table gives the dates of first and last killing frosts for a period of 11 years at various places in California. Elevations in feet above sea level are given, but it must be remembered that frost occurrence is as much dependent upon conditions of topography affecting the movement of cold air currents, etc., as upon actual elevation.

THE COMING SUGAR BEET HARVEST

Written for California Cultivator

By Percy L. Edwards

The coming sugar beet harvest on the Pacific coast will show Southern California producing practically the entire crop. On account of the action of beet sugar manufacturers following the tariff changes and the refusal of growers in some sections to accept the reduced price offered for the beets, the principal operations this year are confined to Southern California.

Growers of sugar beets in Southern California have for some years past regarded this crop as one of the best money makers and at the same time a valuable aid to soil productivity. So when requested by the factory management to accept the reduction in price per ton, about 40 cents, they accepted the terms of the manufacturers rather than have the factories close their doors. And to the credit of both the growers and the factories it may be said that not a single plant in Southern California has suspended operations. But one plant in this whole section will be idle this year; the plant at Corcoran, which has not been in operation for several years past. There are 10 factories in Southern California. Of these 10 four are located almost within sight of each other in Orange County. The factory at Los Alamitos is just over the line in Los Angeles County and is the fifth plant almost within a stone's throw of the others.

Last season there was produced in this section of the state alone nearly 500,000 tons of beets, for which the growers were paid at the average of $5.80 per ton, or $2,900,000. Upwards of 85,000 tons of granulated sugar was produced in this single section lying in the valley of the Santa Ana.

Near the mouth of the river are yet to be found the swampy lands used as preserves for the wild duck and goose. The recovered peat lands now used for celery growing are lands once left to the uses of the wild fowls. These lands, now so valuable, were traded for a mere song a few years ago. Today $500 per acre is asked by the owners of the lands. Thousands of acres of the old grain lands of this section are now devoted to the growing of beets. A few years ago it was learned that these grain lands which had been cropped year after year to wheat, barley and oats, giving returns scarcely more than the outlay, were adapted to the sugar beet. Since that time there are many farmers in the vicinity of the factories of that section who have made money out of this crop. Land has been bought and paid for from the profits of sugar beet growing. Attractive homes have been built and improvements made throughout the beet section. This condition is the best evidence of the value of sugar beet growing to the farmer and the value of the industry to the community.

The weather of the present season has been unusually favorable for a heavy crop of sugar beets in California. Copious rains well distributed throughout the early growing season have assured good stands generally. There seems to be no doubt of a heavy tonnage this year. Although, on account of the action of the factories in reducing the price offered to growers, there was less acreage planted, the favorable weather, it is estimated, will bring the tonnage quite up to that of the past year, which was the largest in the history of the industry in this state. On an acreage of 137,000 California produced 1,290,000 tons beets last year. As the beet fields are now "laid by,' which means that operations have ceased until the harvest begins, estimates of the tonnage are made which are fairly reliable.

The first testings of the beets for sugar quality are now being made at the different plants. On account of the lack of sunshine during the month of May these preliminary tests are less than normal. But the sunshine that is certainly due during the next six weeks should put the sugar in the beets that gives California first place in this respect.

Within this month, when the big, booming whistles of the factories announce the beginning of the sugar campaign, all of the plants of this state, except those at Hamilton City, Corcoran and the Alameda factory will be in operation. The Sacramento Valley Sugar Company, whose [illegible] is located at Hamilton City in [illegible] County, and the Alameda [illegible] cently established in Monterey [illegible] are not to operate this season, giving as the reason the uncertainty of the future sugar market. The Corcoran factory has not been in operation since its first campaign in 1909. It is tied up by litigation. The plants at Salinas, Visalia, Betteravia, Oxnard and Chino, will be in operation as usual. The Oxnard and Chino factories get a part of their beets from Orange County, and both expect a campaign lasting about 100 days. The fields look very promising and estimates show many fields will average 20 tons per acre.

Estimates, as the crops now stand, indicate that the yield per acre will very much exceed last season and the gross tonnage be quite as large. The factories at Anaheim, Santa Ana, Los Alamitos and Huntington Beach are in preparedness for the campaign which is expected to run the usual length, about 100 days.

Los Alamitos, the oldest factory of the group, is located amid great stretches of old grain fields which have proven of so much value to the beet growers of California. The factory was the beginning of things in this locality. Since that time some 15 years ago, a neat little village has grown up about the factory and the country has improved with the progress of the beet sugar industry. These old grain lands which were fast becoming unproductive because of continual cropping to grain and the superficial cultivation of same, have since the introduction of the sugar beet advanced in market price two and three fold. Add to this that where grain is now raised on these lands in rotation with beets the yield is increased quite 100 per cent in some cases.

At Huntington Beach is the newest of Orange County's sugar factories. This factory has a capacity of 800 tons of beets per day of 24 hours. It is a model factory of its kind and is unusual in that it is run entirely by electric power. No other sugar factory on this coast is. Its product is grown in fields where irrigation is unnecessary. The natural rainfall is helped by the heavy mists which sweep in from the seas carrying co-

Farmers Must Organize

The Danger from the Eight-Hour Law Impels Early and Continued Work. Several Organizations Already Earnestly Informing Voters as to Peril to Farmers

Organize and fight or suffer from the greatest handicap which growers of this state have ever striven under, is practically the situation now before the farmers of California. The danger is far from imaginary, for the sophistries of the visionary are being accepted by those who have given the subject little thought.

The Farmers' Protective League is doing excellent work in the north. Mr. Arthur Dunn, secretary and manager, writes:

Farmers' Protective League.

It appears to us that ridiculous as this measure may appear there is very grave danger of its being adopted. There is only one chance that the farmers of the state have, and that is that by their own complete organization they may be able to educate sufficient numbers of the city voters to offset the organized advocates of this bill.

While the $2.50 a day minimum wage measure has not yet been placed upon the ballot by initiative petition, Secretary of State Frank C. Jordan has been informed by representatives of the socialist party, who drafted the bill, that the proposition will be on file before August 3, the last date upon which it may be received. The qualifying signatures, he has been informed, will come from Los Angeles, San Francisco and Alameda Counties.

HERE IS THE EIGHT HOUR LAW

"An Act to amend the Penal Code by adding a new section thereto, to be numbered 393½, limiting the hours of labor of employes and providing a penalty for violations of the provisions of this Act.

"The People of the State of California do enact as follows:

"Any employer who shall require or permit, or who shall suffer or permit any overseer, superintendent, foreman or other agent of such employer, to require or permit any person in his employ to work more than eight hours in one day or more than 48 hours in one week, except in cases of extraordinary emergency caused by fire, flood or danger to life or property, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not less than $50 nor more than $500 or imprisoned in the county jail not less than 10 nor more than 90 days, or both so fined and imprisoned."

The proposed statute fixes the compensation of all working persons over 18 years of age at $2.50 a day, and $1.50 a day for all under 18 years of age.

"The Farmers' Protective League of California will fight the minimum wage bill along with its twin, the Universal Eight Hour Law, and its little brother the $5,000,000 state factory, with its free board, free lodging and free clothing provision," declared Arthur Dunn, secretary and manager at Sacramento. "We realize that the proponents of these measures are organized, and an organized minority has the advantage of an indifferent majority. However, farmers are organizing everywhere. This league will have branches in 50 of the 58 counties of the state.

"The gravest danger California faces is the number of propositions to be voted upon. Secretary of State Jordan informs me about 50 measures must be decided by the people, and he is preparing booklets containing 96 pages, or about 120,000 words printed in small type, the text being descriptive and argumentative of the amendments. It will be almost an impossibility for a voter to read this understandingly inside of one month. These booklets will reach electors about the 1st of October. The shortest measure described in the book is the Universal Eight Hour Law, which contains 108 words, eleven commas and one semicolon. This amendment will be third on the ballot, the one authorizing a call for a constitutional convention being No. 1, and the prohibition amendment being No. 2. All of this extra printing and postage will cost the state and county governments approximately $200,000, and there will be a charge of $50,000 for printing the ballots. The ballots will be more than two feet long and nearly three feet wide, or 26x32 inches.

"It must be understood that initiative measures once adopted by the people cannot be amended by the legislature, vetoed by the governor or altered in any manner except by another petition duly initiated and receiving a majority vote at a subsequent election. That is one more reason why the Universal Eight Hour law must be defeated."

In the south the Farmers' and Fruit Growers' Federation is already busy, though only just organized.

Farmers' and Fruit Growers' Federation.

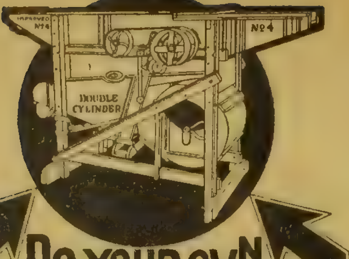
At the first meeting those present unanimously declared that, inasmuch as the law as submitted contains absolutely no exemptions, with no allowance for sun, wind, rain or other uncontrollable conditions of nature affecting the harvesting and marketing of crops, it would prove a disastrous blow to all agricultural interests and to the general prosperity and welfare of the state.

F. Q. Story, president of the California Fruit Growers' Exchange, was unanimously elected president of the new organization; H. B. Chase of Riverside and E. G. Dezell were chosen vice-presidents; F. O. Wallschlaeger was made secretary-treasurer. The executive committee includes also E. S. Moulton and W. G. Fraser of Riverside, C. C. Teague of Santa Paula, E. M. Lyon of Redlands, W. W. Sprott of Porterville, C. C. Chapman of Fullerton and G. Harold Powell of Los Angeles. Pitt P. Hand of Los Angeles was made campaign manager in charge of the work against the proposed harmful legislation.

The federation proposes before the November election to show the public exactly what the sweeping Eight Hour Law would mean to all tillers of the soil, that it would increase the cost of production from 20 to 30 per cent and raise the cost of living to every consumer.

The Eight Hour Law as submitted in Proposition No. 3 on the November ballot is the most inflexible and drastic statute on the subject ever drawn. It was almost unanimously voted down by the last legislature as too sweeping and dangerous. All similar laws restricting hours of labor for males, such as that in New York, contain exceptions to provide for necessities of farming. The "Women's Eight Hour Law" recently adopted for California makes exemptions of household helpers, nurses and others to provide for similar necessities. The socialists' "universal" law now proposed embraces all wage-workers, men and women, even including the women exempt from the existing law. The farmers contend that, beside being ruinous and impracticable, the law submitted is flagrantly discriminatory in that it provides for "a fine of $500 and a jail sentence of 90 days" for any employer permitting "more than eight hours' work in one day or more than forty-eight hours in one week," it imposes no obligation whatever upon the employee.

Secretary Wallschlaeger yesterday



DO YOUR OWN THRESHING

of Beans and peas with a guaranteed Owens Thresher. All your seed separated and cleaned from the vines and pods without splitting. Pea and bean growing is the most profitable farming if handled right.

OWENS DOUBLE CYLINDER Bean and Pea Thresher
— Made in 4 Sizes —

will pay for itself many times over in one season. Guaranteed not to split the seed and take all from the vines.

FREE BOOK

Send for our free book of valuable information about bean and pea culture. Illustrations and description of our machines. Facts and figures showing results obtained by users of our Hullers — write today. Dept. 11.

J.L.Owens Co. 18 Cham. of Com. Bldg. Minneapolis, Minn.

Perforated Tree Protector

The only Perforated Protector made; practically a small lath house about each tree, allowing the free circulation of air and mellowing the hot rays of the sun while giving perfect protection. No mouldy, smutty bark when using our wraps. WHEN DOES YOUR TREE NEED PROTECTION WORST? You know—while it is young and tender. Let us sell you Protectors. It's the best investment you can make after planting your trees. If your dealer hasn't them, send your order to us and we will fill it promptly.

Samples and prices furnished on application.

LOS ANGELES, CAL.

stated that the law would mean an increase in production cost of 25 per cent to California growers of oranges and lemons, who already are under a handicap in competition with Florida, Porto Rico and Europe, where production cost is less than it is in California even now.

The farmers urge that the prohibitive law would tend to drive California agriculture into the hands of Hindoos, Japanese and Chinese, who would operate leased lands through "partnerships." Also that it would bring here many undesirable citizens in search of the "easy life" and a "labor paradise."

The Farmers' and Fruit Growers' Federation will have headquarters at 740 Consolidated Realty building, Los Angeles, where weekly meetings will be held. Agriculturalists throughout northern and central California have formed organizations to oppose the law, and similar movements are under way in every county of Southern California.

J. W. Mills, Marysville.

It is my opinion that the most serious problem that confronts the farmer is the proposed Eight Hour Law applied to farming operations. It is not a question of seasons and special work at any one particular time that such a law would cripple the farmer. Occasions arise at the most unexpected time when overtime work is necessary to save serious loss. Were we to commence to cite examples there would not be space in one of the big dailies to print them. With few exceptions, the farmer's margin of profit is very narrow, and a loss, though very small, postpones the time of clearing up his debts. It is not generally realized that most of the farming operations are done on credit of some sort and the debt has to be paid.

The winter just past affords a good illustration of how the Eight Hour Law would bankrupt the grain farmer and seriously cripple the fruit grower. The continuous wet weather prevented plowing and seeding till March. The farmer was compelled to sit idly by, feed his idle stock and watch the rain come down all winter, and as soon as the land would permit being worked it was a constant rush from daylight till dark, and then the season was too short to produce normal crops of late grain. It was not possible to work two eight hour shifts of men unless two shifts of horses were available. There is seldom enough to supply the present demand at such seasons. Another illustration. I at one time had a gang of 20 Chinamen making raisins. About 5 o'clock in the evening a thunder shower started to form. Every man was put to work stacking trays. We all put in 13 hours' work that day and ate supper at 9 p. m., but we saved enough raisins to pull the grower through on the season's work. Had we been hampered by the eight hour law we could not have gone to town, a distance of five miles, rustled a crew of 20 men and stacked the raisins before the rain fell.

The most deplorable feature of an eight hour law is that it will result in the abandonment of the management of many farms by their owners and result in the formation of Oriental and Asiatic companies who will handle the farms; the law of personal freedom will protect them, while we are tied down and made liable to a criminal charge for doing just what the Jap and Hindu is protected in unless we take the hired man in as partner.

A. L. Hurtt, San Bernardino.

Keep up the fight against the eight hour law. Some one should make a speech against it in every school house in the state between now and November 3. That is the only way to reach the non-reading farmer.

Earl Logsdon, Goshen.

In all the recent issues of the farm papers I see articles on the proposed eight hour law.

In central California there are men out of work with plenty of work out on the farms away from the cities. These men stay close to the cities, where they have registered so as to vote for this law.

Several have told me that they did not care how the election went just so the eight hour law went through. That class of people do not work except when they cannot beg or get an easy snap. When hired they "kill" all the time the can, so if one has a right to judge from what they say and appearances they will do the same if they only have to work eight hours.

If the law is passed it will either compel the farmers to close down and quit the job or freeze the hobo labor out of the state as soon as possible.

Central and northern California are strong union places and all the unions favor the eight hour law, and the bill will be hard to beat unless some pressure is brought to bear on the minds of the voters before the election.

Geo. D. Kellogg, Newcastle.

In the matter of the proposed eight hour law and its effect upon the farming and horticultural interests of our state should the proposed amendment carry, I am free to say that I think it will be unjust and work a great hardship to the farming and fruit industry. To take a 20 mule outfit with its combined harvester and thresher into the harvest fields and shut it down at the expiration of eight hours' labor would mean a great loss of grain, I fear, to the owner. Likewise the haying operations.

For 36 years I have made a ten-hour day, and a six day week by my employees a success and satisfactory in my orchards, but for the limit to be made eight hours a day, and not more than 48 hours a week, gives a perilous outlook for the fruit industry. As a shipper of fruit in car lots for over 30 years, I cannot see how it could be accomplished and care for the fruit properly. We could not afford to hire a double shift, and there has been no way devised as yet that could possibly handle the shipments of fruit within the eight hours without seriously discommoding the growers.

As a domestic proposition it would be impractical. The employer would be obliged to care for stock, do his chores, waken his hired men at eight o'clock in the morning, call his domestic and tell her to get the dinner on the table at four o'clock p. m and go to bed, and you would do all the rest.

The proposition might work out among the mechanics, factories, banks and some such enterprises, but not so with the farmer and fruit grower. The measure would certainly be inimical to the best interests of these important industries, and would work no benefit to the employed.

C. O. Nichols, Bostonia, San Diego County.

I do not often make an attempt to rush into print, but the subject of the proposed eight hour law seems to me so vital as affecting the interests of both the fruit grower of this section and the laborer employed by him that I can not help but congratulate you in your effort to get at the facts in the case through the columns of your publication.

The few instances cited below, which would seem to work to the disadvantage of all concerned, may have been instanced before and in a more convincing language than the writer has at his command; if so well and good.

Farming is carried on in this section at so close a margin that any factor brought into the operation that tends to decrease the margin to the vanishing point will prove fatal to the industry, and I can think of no one law affecting our branch of it that would come nearer eliminating what profit there may be than the proposed eight hour law where applied to farm labor.

The writer is in charge of a property consisting of about 500 acres planted to the raisin grape, and about 40 acres planted to citrus fruit.

There are so many ways in which this proposed law would prove disastrous, that one hardly knows where to begin, but we may mention two, one for each branch. The raisin grapes when picked are placed on trays which remain on the ground, unprotected, until the action of the sun has turned them into the raisin of commerce. The season of ripening is so late that before the process of curing has been completed the early rains are upon us. The only method possible to save the crop is to place the trays, one upon another, in stacks about breast high and cover them with empty trays.

Now we do not control these rain storms; they come at all hours; often at night and sometimes on Sunday the bell will ring, and we all go out to stack trays; and it is only through the assistance of our very able weather bureau service, together with our own watchfulness that we are able to save the crop.

The suggestion may be offered that we hire a new force to do what stacking is necessary after hours. Impossible. We sometimes have as high as 150 to 200 laborers during part of the raisin season, and other growers in proportion. We have all scoured the immediate neighborhood, retained more laborers than necessary to conduct ordinary operations at this time for the express purpose of having them ready in this emergency, and no more laborers are available at short notice.

We pack and ship most of our citrus crop. Suppose we have sold a car of oranges at a certain price to be loaded and shipped on a given date. This class of produce is shipped in refrigerator cars. One can not order a car of this class today and get it tomorrow; and as oranges are perishable fruit they can not be picked and packed much ahead of shipment; hence it is more often the rule than the exception that things must be rushed at the last moment, working overtime that the car may be delivered as per contract, to prevent its rejection; in which case it becomes a tramp car, to be sold as such for what one can get.

Packing of citrus fruit is all done by experienced men and women. In this section there are few packers, and in no case could one secure other than those already engaged to finish the car. Under existing conditions in this section, with so little margin for the fruit grower, I do not see what the laborer can expect, other than to see his per diem shrink with his hours of labor if the proposed law goes into effect. Conditions, not lack of sympathy on the part of the employer, will force this reduction, and under the law he will work a less number of hours for less pay, for while it is a fact that it is quite possible for a man to accomplish no more work in 12 hours than he should in eight, it is a physical impossibility for an honest man to do as much work in eight hours, or ten hours, as he could in twelve.

SAVE THE ROADS

We mentioned some time ago the arrest and fining of a traction engine driver for injuring the road surface of one of the newly completed state highways by driving over it with a heavy tractor. The engineer was requested to drive alongside of the highway, but refused, claiming he was entitled to the use of the road. The cleats or lugs on the immense drive wheels, of course, did serious injury to the surface. This driver's arrest and fining should have a beneficial effect. Anyone who is so regardless of the rights of the public as to maliciously injure the roadways which have cost large sums of money to build, should be dealt with severely. The good roads are proving their worth and are being demanded more and more, and their mutilation will not be tolerated.

WAKE UP

Read some of the plain statements on page 82 of this issue, then get busy and organize. That "invitation" isn't addressed to just anyone, but direct to you, Mr. or Mrs. Reader. Your future prosperity and that of this state of California depends in a far greater measure than you imagine on the result at the polls on Nov. 3. You can influence that result by one vote, two votes, three votes or a hundred votes, providing you **get busy and wake up.**

The alarm clock has already "gone off." Why don't you roll out and urge all to vote against the universal eight-hour bill?

RECLAMATION LANDS.

We have from the reclamation service statements of various projects on which there are still farming lands open to entry. Noting that none were available in California or Arizona we wrote the service and have word that all lands in reclamation districts of these states have been taken. This is proof of the worth of the lands and of the water rights. In Idaho, Montana, North Dakota, Nebraska, Wyoming, South Dakota, there are many such farms open to entry at $30 to $55 per acre, including water right, and of course on the usual ten-year payment plan. The greatest number in any state is in Wyoming. In one district, the Shoshone, there are 200 farms ranging from 40 to 80 acres each and at prices from $50 to $52 per acre. From this the various districts range down to the Yellowstone project in which there are now 18 farms left at $45 per acre.

CROP CONDITIONS

This state will this year produce practically 8,000,000 bushels of wheat, or to be more exact, according to the figures issued by the bureau of crop estimates, 7,950,000. The average production for the past five years has been 7,047,000. In oats the forecast is that this year's production will be something over 8,500,000 The five-year average has been 6,624,000. For barley the forecast is 45,800,000 bushels, while the five-year average has been 3,769,000. If this forecast is correct this will be fifteen times as many bushels this year as for the past five years. It surely is a wonderful year, and California is in position to take advantage of it.

ORANGE PRICES.

The orange grower is disappointed by the turn the orange market has taken. A few weeks ago there was a decided upward trend, and the immense crop gave promise of bringing immense returns. There has been no period of the year in which large prices have been received, but there has likewise been no disastrous slump, and averages to growers for first class fruit have been very fair. But the promise of much larger prices was broken by a weakening market, caused by intensely hot weather over the East, receipts of small fruits in all markets, combined with abnormally large shipments from all citrus sections. Shipments are now slowing up; navels are practically all in and the 8,000 cars of Valencias remaining are commanding fair prices. The grower and shipper must be more careful, for he has been sending well up toward 2,000 cars per week, which is more than the market will absorb.

STORE THE FLOODS

While congress does politics, great questions remain unanswered and great resources are frittered away. While the Newlands bill is waiting for sufficient support to secure its enactment, the Colorado rises and does untold damage; another few months and the Mississippi will destroy lives and millions of property because no effort is made to hold back the floods which should be stored to be a benefit when needed.

Following the plans which have proved futile in the Mississippi Valley, owners of rich lands along the Colorado are engaged in raising levees higher and higher. How much more reasonable it would be to throw the fullest support to a measure like the Newlands bill, which, instead of attempting to dam the mouth of the river, proposes to work at the source, and which, we believe, offers a solution of this great problem. Imperial Valley has sent a lobby to congress and will work for a liberal appropriation for work directly at the seat of the present trouble. This is perhaps wise, but may there not be greater wisdom in also working for the Newlands bill? The best part of this measure, which should command for it the support of the entire country, is that the benefits resulting from its passage will not be local, but will apply to almost every section of the United States.

DOES FARMING PAY?

The University of Arizona, or rather its experiment station, is sending to farmers a blank report which it is requested be filled out and mailed to the station. It will collect a fund of information as to business methods, especially as to bookkeeping which farmers do or don't do. Such points as distance from the station, area of ranch, rented or owned, number of acres improved, number of acres in pasture and other points of a general nature, are first asked. Then as to values; number of live stock, with value, number sold, number died, number on hand at the end of the year; amount of butter produced on the ranch, cream sold at wholesale, milk at wholesale or retail, at condensary or cheese factory, buttermilk and amount received every day; in fact, a full list of all the productions of the ranch. It is requested that the cash expenditures for the year be given. Under this head comes the amount paid out for labor, exclusive of household help, amount paid out for machinery fittings, repairs, fences and repair of fences, hay, silage, straw, water, etc., down to the smallest detail.

Just what use the station will make of these figures it does not inform us, but we can see one great benefit, and that is that it will awaken in many farmers a realization of the fact that there may possibly be some advantage to him personally in keeping tab on receipts and expenditures. Farm bookkeeping is becoming rather more popular than it was at one time, yet we doubt not there are many farmers who have hardly a diary to help them keep track of their business transactions. The business of farming is becoming more and more strenuous, and the farmer who does not watch and keep a record of transactions which prove unprofitable and those which are profit bringers stands a chance of not making good. We hope Arizona will summarize and give us some lessons from the returns from this request.

Agricultural News Notes

The International Irrigation Congress will this year meet in Calgary, Alberta, Canada, October 5-9.

The color line is being drawn in the army in the purchase of horses in favor of sorrels, browns, bays and blacks. The light colored mounts are fine targets for sharpshooters.

From Nice, France, comes the report that the present outlook for the olive crop for the spring of 1915 is, so far, encouraging. The trees have blossomed abundantly, and the young fruit is commencing to develop satisfactorily.

Congress recently passed an act granting $500,000 to the department of agriculture to combat hog cholera. Experiments will be carried on in 15 different states and farmers will be organized to cooperate with state and federal authorities.

Wheat and wheat-flour consumption annually per inhabitant is estimated at 202.7 pounds in Germany, 580 pounds in France, and 650.7 pounds in the United States. German consumption of rye flour is about as much as that of wheat flour.

Apricot kernels exported from China during 1912 amounted to nearly 6,000,000 pounds. The sweet kernels bring about $20 gold per 100 pounds; the bitter, about $5. The cracking of the seeds and extractng of the kernels is all done by hand with a wooden hammer, the seeds being first soaked in water to moisten them..

The American Presbyterian mission at Allahabad, India, is acquiring 53 acres near Allahabad to establish a fully equipped agricultural department for experimental work in connection with the Ewing Christian College at Allahabad. It will be in charge of Samuel Higginbottom, an American missionary who has become noted for the important improvements in agricultural methods he has introduced among native farmers near Allahabad, teaching them the use of American plows, etc.

The department of agriculture has issued revised regulations governing the interstate movement of live stock, embracing changes designed to facilitate the movement of stock from quarantined areas. Cattle that have been dipped once under state or federal supervision may be shipped from an area quarantined for ticks to a market center where there are proper dipping facilities and the department of agriculture maintains an inspector. After a second dipping the cattle may be sold for any purpose.

Agricultural cooperation has proved successful in Scotland, especially in the past ten years. There are now upward of 124 agricultural trading societies, principally in the Highlands and islands of north Scotland. The total trade of these associations in 1913 was about $1,888,000. The collective purchase of implements, fertilizers, and other supplies and sale of products of agriculture are effected through federations of local societies. Producers of milk have been able to obtain an improved price by a system of milk depots which largely prevents losses through periodical oversupply and fluctuating demand. Considerable increases in the prices of eggs have been obtained by better grading and collective marketing. In the purchase of superphosphates collective buying by many societies resulted last year in reducing the price by $2.43 per ton.

Agricultural News Notes of the Pacific Coast

Northern California

Fruit packing houses at Placerville are cooperatng in sending out carload shipments.

The Woodland unit of the Yolo County Farm Bureau has organized to fight hog cholera.

The university farm at Davis has just received 107 head of beef cattle to use in feeding experiments with silage.

Several carload shipments of beef cattle have been sent out from Ducor in Tulare County in the last few weeks.

Four eight-months-old Duroc pigs have been sent to Hawaii from the university farm at Davs. The bunch of our brought $200.

Shipment of Bartlett pears from the Placerville district in Eldorado County began July 15th. The crop this year is unusually large.

August 5th has been set apart as Grange Day at the Gravenstein Apple Show at Sebastopol. The apple show will be held from the 3rd to the 9th.

Horticultural Commissioner Bremner of Sonoma County is making up lists of growers in his county preliminary to mantaining a growers' service bureau.

Fruit growers of Atwater, Merced County, who were offered four and one-fourth cents for their dried peaches, joined the cured fruit association and secured five cents.

Yolo County has formed a branch of the California Farmers' Protective Association with a membership of more than 300. W. S. Evans is president and H. S. Maddox, secretary.

At the last regular meeting of the Sacramento Valley Fanciers' Association it was decided to hold a show at Sacramento November 2-7, in conjunction with the Sacramento Poultry Association.

Up to July 1st over 400 cars of deciduous fruits left Winters, Yolo County, most of them for eastern markets. It is thought the total for the season will reach 700 cars, including grape shpments.

Farm Adviser Lyons of San Joaquin County is expermenting in several vineyards with thinning Tokay clusters. He hopes to produce more evenly colored, better formed fruit with no decrease in tonnage.

Horticultural Commissoner Rutherford of Stanislaus County estimates there will be in that county a 100 per cent crop of almonds, apricots, figs, grapes, cherries, berries, lemons, olives, oranges and walnuts.

County Horticultural Commissioner Howard Kerchival of Sacramento County recently gave spraying demonstrations against red spider affecting almonds and prunes. It is found that atomic sulphur has given best results againt the pest.

Assistant Farm Adviser Searles of Yolo County has posted the following schedule for meetings of the county farm bureau during August: First Tuesday, Esparto; first Thursday, Guinda; second Monday, Winters; second Friday, Davis; third Monday, Clarksburg; third Wednesday, Knights Landing; fourth Monday, Dunnigan; fourth Wednesday, Yolo, and fourth Thursday, Woodland. These dates if satisfactory will be followed during the rest of the year.

Central California

Turlock melon growers are receiving $15 a ton.

Visalia is planning to hold a citrus fair some time in December.

Sugar beet harvesting is progressing near Alpaugh in Tulare County.

San Joaquin County has bought an automobile for the use of its county farm adviser.

Practically all large firms of grape shippers have joined in the standardization agreement.

On account of low prices offered for green fruit many peach growers have decided to dry their crops.

An experimental planting of rice on 12 acres near Allensworth, in Tulare County, has proved very successful.

The first grapes shipped from the Vacaville section of Solano County was a quarter of a carload of Baby Toes.

Work is progressing rapidly on repair of the Davis reservoir near Turlock. The water is now all out of the reservoir.

The percentage of sugar is reported running very high in the Alpaugh beet fields. The beets are now going to the factories.

Tulare County's ability to produce alfalfa is shown on the ranch of John L. Adams, where the fifth crop has already been harvested.

President Burton of the Tulare Fruit Growers' Association states that applications for membership in the association are coming in rapidly.

Fruit growers of the Pajaro Valley met at Watsonville on Tuesday of last week to devise means of preventing importation of fruit pests from other states.

With the possible exception of the prune crop all green fruits in the Sacramento Valley are estimated as close to normal by the state commission of horticulture.

The San Joaquin Valley Date Association has filed articles of incorporation. Directors are: W. R. Nutting, George S. Waterman, D. L. Newman, M. K. Harris, Hans Karrer, S L. Strother and Henry Hawson.

San Jose poultrymen at a recent meeting listened to a talk by W. P. Humphries, organizer of the Sonoma County Poultry Producers' Association, on the subject of a state-wide association modeled on the lines of that in Sonoma County.

Apiarists are being notified of the provisions of the net weight container law which requires that contents of cans shall be plainly marked before honey is sold and that the five-gallon square can shall be packed to contain 60 pounds net weight of honey.

Stock ranchers of San Benito County have issued an appeal and warning to hunters to be careful of camp fires, not to shoot among stock, not to hunt on property where they are not invited to hunt, and to be generally careful of other people's property.

More than 25 per cent of the watermelon crop of the Turlock Irrigation District, according to a report of County Horticultural Commissioner Rutherford, has been destroyed by wilt. On account of the fungous nature of the trouble it is feared no remedy can be found for it.

Southern California

Los Angeles County claims 33,363 automobiles.

Riverside has decided to construct Mission style buildings for its county fair.

The California Vegetable Union shipped last year from the southern part of the state 46,000 carloads of vegetables, including melons.

Estimates of the sugar beet crop for this season now indicate that while the acreage is smaller than in 1913, the total output will be larger.

Southern California's bean crop this year will be valued at more than $3,500,000, according to estimates made by railroad freight statisticians and large bean holders.

The grape shipping season is on in full swing at Calexico in the Imperial Valley. An average of two cars per day for 15 to 20 days will be shipped from that district to coast and eastern markets.

L. O. Howard, chief of the bureau of entomology, department of agriculture, is at present in Southern California. He is investigating the outbreak of cutworms which are attackng sugar beets.

The production of honey in Orange County this season will be very light. Lack of sunny weather is responsible for some of the decrease, but it is a fact that many of the bee men have given up their stands.

Approximately $70,000,000 worth of oranges and grapefruit will be consumed by the American people the present season, according to figures furnished by Manager Powell of the California Fruit Growers' Exchange.

The organization of a general protective league for the walnut industry, to include independent shippers as well as members of the Southern California Walnut Growers' Association, has been proposed by Mr. Thorpe, manager of the association.

The Lemon Men's Club of California met at Corona, Saturday, July 11th. Among the speakers were Prof. Quayle, whose subject was "Enforcement of Scale Eradication," and G. Harold Powell of the exchange, who spoke on "The Future of the Lemon Industry."

Walnut growers of Garden Grove, Los Angeles County, have organized an association. Charles Swall has been elected president; W. E. Schnitger, vice-president, and Ed. Lee, secretary and manager. The association will handle about 300 tons of walnuts this year.

With the final settlement of the claims of orange growers of Colton, Riverside County, against the Riverside Portland Cement Company, that concern will begin at once to double its plant at a cost of $1,000,000. Settlement was effected by the company purchasing the groves outright at prices fixed by a board of appraisers.

Orange growers and packers of Orange County assembled at the packing house of the Anaheim Fruit Association last Saturday to discuss the disposal of cull fruit. The idea is to keep the cull fruit from competing in the home market wth the first-class article and also to devise some means of turning the cast-off oranges into a profitable by-product.

The Coast

Many Chinese eggs received in Portland have been put in cold storage.

The Salt River Valley of Arizona reports its best cantaloupe crop this year.

Summer rains have set in in Northern Arizona and the Roosevelt Reservoir is filling.

Carload exhibits of range stock are to be a feature of New Mexico's coming state fair.

Yavapai County, Arizona, shipped out 400 carloads of cattle during the first half of June.

Farmers of Monmouth, Oregon, are reported paying 25 cents a head for gophers caught in ther fields.

A boys' cotton club has been organized in Chandler, Arizona. This is claimed to be the first in the United States.

More than 46,000 acres of grazing lands in Eastern Washington will be leased this month by the state to sheep men.

North Yakima; Washington, has shipped 30 cars of cherries and this is estimated as about half the crop for the entire valley.

The Yakima Valley of Washington will produce this year 28,000 bales of hops, according to estimates of prominent hop growers.

From Douglas, Arizona, comes the report that the range is in good condition. About 12,000 cattie have been shipped from that section this season.

The Utah Fruit Growers' Association this year shipped 30 carloads of cherries, as compared with two carloads last year. The fruit averaged $1000 a car.

The Oregon Cattle and Horse Raisers' Association offers a standing reward of $1,000 for the conviction of any person stealing cattle of an association member.

President Clark of the Wenatchee Valley Fruit Growers' Association says that growers will never get rid of fire blight until every insect in the Northwest is eradicated.

Secretary Ramage of the Washington Beekeepers' Association says this has been a very unfavorable honey season on account of the cold weather preventing secretion of nectar. Many apiarists are feeding their swarms.

The great Chandler ranch, on which is now situated the town of Chandler, Arizona, has shrunk in acreage until on the first day of this month the ranch headquarters were formally closed. One of the greatest ranches in Arizona has passed.

Yakima County, Washington, has been divided into two sections for the purpose of a campaign against fire blight. Each section will be in charge of a deputy inspector, who will have five or six sub-deputies to aid him. The growers will be organized into protective associations.

At a recent meeting of the Cattle and Horse Raisers Association of Oregon preliminary steps were taken for the formation of the Northwestern Cattle and Horse Growers' Association. All the small associations in Oregon, Idaho and other states of the Northwest will be asked to join the larger organization.

What Does a Silo Cost?

AN IDEAL GREEN FEED SILO will pay for itself the first year. That being the case, it will cost you nothing.

AS A MATTER OF FACT, THE COST of a silo is really a secondary consideration, because if you are keeping dairy cows or raising stock for the market, there is no investment which you can make which will pay you better returns than an **Ideal Green Feed Silo.**

A GOOD SILO IS A NECESSARY PART of the dairy equipment of every cow owner or stock raiser who wants to realize a reasonable profit from his herd, and if the matter of cost has been standing in your way, please remember that it is really not a question of whether you can afford to erect a silo, but whether you can afford to do without one.

IF YOU HAVE NO SILO, A LITTLE investigation will be sure to convince you that you ought to purchase one right away.

THE SHREWDEST AND BEST POSTED ranchers in Pacific Coast States are buying **Ideal Green Feed Silos.**

Write for new Silo Folder A for full information.

CHEESE FROM SHEEP'S MILK

Written for California Cultivator by Leroy Anderson

On the ranch of Henry Glide, five miles north of Dixon, 700 sheep are being milked twice daily for cheese making. Mr. Glide rents has sheep to a Swiss who does all the work while Mr. Glide furnishes the feed (pasture). Four men are required for milking and the job is completed in about three hours. The milker sits on a low stool at the opening of the corral from which the sheep are driven. A low wooden tub about seven inches deep by 15 inches in diameter is used to milk into. This is set slightly into the floor so that the milk may be conveniently drawn into it. The sheep average about one pint of milk at each milking, which for the lot makes 700 quarts a day or about 1500 pounds. They are chiefly the Merino type and not bred for milk production like some sheep in Europe.

Sheep's, or ewes' milk is much richer in fat and casein than cow's milk and thus will make more cheese to the hundred pounds. German analyses give a good comparison of the relative quality.

Comparison of Ewe's and Cow's Milk —Per Cent Composition

Authority	Water	Casein and Albumin	Fat	Sugar	Ash
Sartori—Average of analyses of milk from 2,700 ewes	78.70	6.30	8.94	5.06	1.02
Konig—average of analyses of milk from 705 cows	87.27	3.39	3.68	4.94	0.72

According to these analyses ewe's milk has 21.3 per cent solid or dry substance as against 12.73 per cent for cow's milk, or an increase of 67 per cent. On this basis 100 pounds of ewe's milk should make about 50 per cent more cheese than an equal amount of cow's milk. This fact helps to make it profitable to milk ewes in California when large numbers are available. The milking season this year will be not over five months, beginning March first. In 1913 the season began February first and lasted six months, but this year, owing to heavy rains, the lambs could not be weaned so early. Lambs are left with the ewes until about three months old when they are weaned and milking the dams begins.

The milk is made into cheese as soon as possible after each milking. It is placed in a vat and rennet stirred in thoroughly. In 30 to 35 minutes the milk is coagulated, when it is taken out in cloths and drained. When sufficiently drained, so that it will keep its shape, the curd is molded into circular forms, each weighing about six pounds, and rubbed thoroughly with dry salt. The curd lies on a draining table 12 hours and then is packed in brine in large wooden (oak) hogsheads—holding possibly 100 gallons. After soaking there for four or five days the cheese is taken out and washed in fresh water to remove all salt from the surface. Then it is packed in small oak barrels, about one half barrel, or 20 gallons, in size. They are now ready for shipment and go to market in the barrels which are headed up securely. The chief market is San Francisco, where the cheese brings from 23 to 25 cents per pound.

SUPERVISION OVER IMPORTATIONS

In case you are a breeder of live stock and desire to import a number of animals for breeding purposes or possibly a pure-bred bull, boar or ram for the improvement of your herd or flock, it will be well to know that the federal government maintains a strict supervision over the entry of such animals into this country. The same close scrutiny is exercised over deer, goats or other pet animals, which foreign travelers sometimes wish to bring home as pets or as mementos of their travels.

In either case it will be advisable to defer making a purchase or engaging space for the animals on a steamship until you have ascertained just what requirements govern importations of such animals.

By act of congress, the secretary of agriculture is given authority to make such regulations and take such measures as he may deem proper to prevent the introduction or dissemination of any contagious, infectious or communicable disease of animals from a foreign country into the United States.

Under such authority, regulations of the department of agriculture require that any person contemplating the importation of cattle, sheep and other ruminants and swine from any part of the world except North America, must first obtain from the secretary of agriculture two permits. One of these permits upon presentation to the American consul at the port of shipment will entitle the specified animals to a clearance; the other will assure, subject to inspection, their reception and entry subject to observation in quarantine at the port of entry on the date prescribed for their arrival or at any time during three weeks immediately following. This leeway allows for any unavoidable delay, through bad weather or other cause, in the steamer's schedule.

Three animal quarantine stations are provided on the Atlantic seaboard near the ports of Boston, New York and Baltimore for the detention of imported stock. The animals included in this regulation are cattle, sheep, goats and other ruminants, swine and collie, shepherd or sheep dogs. All animals from parts of the world other than North America are subject to this quarantine regulation. If no disease develops while the animals are detained at the quarantine station the owner is permitted to ship them to their ultimate destination in this country.

All animals of the classes named and which are subject to both inspection and quarantine must be entered through these ports.

Cattle from Great Britain, Ireland and the Channel islands are held in quarantine for a period of 30 days. If from other countries, except those of North America, the quarantine period is 90 days, counting from date of shipment. Sheep and swine from any part of the world except North America, are subject to a quarantine of 15 days.

The department of agriculture receives periodically official reports from various foreign countries concerning conditions as regards existence of certain communicable diseases of live stock. These enable the secretary of agriculture to determine countries from which certain animals cannot be imported without danger to the live stock of the United States. No permits are granted for importations from such countries. For instance, owing to prevalence of foot-and-mouth disease and other communicable diseases in countries of the old world and South America, importations of cattle, sheep, other ruminants and swine have for several years been forbidden from countries other than Great Britain and North America. This work is aimed to exclude communicable diseases, a number of which are unknown in this country, any of which, if introduced, would result in great loss to our live stock industry.

Persons interested may obtain the

latest regulations (B. A. I. Order 209, effective July 1, 1914), on application to the chief of the bureau of animal industry, department of agriculture, Washington, D. C.

CAMPAIGN AGAINST HOG CHOLERA

Under the recently passed act of congress which grants $500,000 to combat hog cholera, the U. S. department of agriculture's agents will cooperate closely with the state authorities to prevent and eradicate the disease by the use of antihog-cholera serum and quarantine methods. Approximately $20,000 will be spent during the coming year in each experimental area selected. Thirteen of the counties, where the work is to be carried on, have been picked out, and in 12 of these the work has already been started. Two other counties are to be selected within a short time.

The thirteenth county, where the work will soon be inaugurated, is Decatur county, in Georgia.

Appropriations will be spent in making surveys, using serum on hogs on infected and exposed farms, in sanitation and quarantine work and i organizing farmers to cooperate with the state and federal authorities. In addition, funds will be used for the production by the department of antihog-cholera serum and for the inspection and proper control of serum prepared by private and other agencies.

Extensive demonstration and educational work also will be undertaken in territory outside of experimental areas to acquaint farmers with the results of the experiments and to supply them with information as to the methods of controlling the disease.

HAVE A DIPPING VAT

Every farm on which hogs are kept should have a dipping vat, and hogs should be dipped regularly. No one can afford to feed lice and ticks good grain and grass, yet tons of feed are consumed in that way. But we know that there is not a dipping vat on every hog farm, nor is there likely to be for years. Se we have a suggestion to make. Use crude oil liberally in all of the water holes and wallows to which the hogs have access. They will come out of these holes literally covered with oil and keep fairly free from lice. Another good scheme is to wrap old sacks and rags on the posts where hogs rub, and keep these saturated with crude oil.

Probably the nearest approach to successful one-crop farming is in California, but a study of the history of "world agriculture" from the earliest times to the period of which we have an intimate firsthand knowledge prompts the suggestion to any one engaged in the production of a single crop that an arrangement by which greater diversity could be obtained will certainly be better for the one who may be handling the land ten years from today, whoever that might be. It seems like a waste of opportunity to grow alfalfa for hogs and cattle on land that will grow fruit, and no one would advise taking out an orchard to make diversity, and there are some small acreages that produce so great a revenue that fertility, physical condition of the soil and all of the things that go to make permanent and enduring agriculture can be obtained regardless of cost. But there are others who are planning farms on lower-priced lands who can well consider a combination of fruit, alfalfa and live stock. This will make a better distribution of labor for all of the year, as well as manure for the orchard from the live stock and a diversity of crops that will make more continuous revenue and a foundation for a farm business that will be successful for generations.

UNSELFISHNESS

When little Margaret passed her plate the third time for chicken her mother said:

"My dear, you must not eat so much chicken. I am afraid you'll be ill."

"Well, mother," said Margaret, "I'm not eating this because I want it; I'm collecting the bones for Fido."—Harper's Monthly.

WORLD'S RECORD COWS

The following table from the Missouri Ruralist shows a list of the best cows, according to latest official records published, and their production of butter-fat for 365 consecutive days each:

Name	Breed	Pounds butter-fat
May Rilma		
Banostine Belle De Kol	Guernsey	1,059.59
Pontiac Clothilde De Kol 2d	Holstein	1,058.34
Sophie 19th of Hood Farm	Holstein	1,017.28
High-Lawn Hartog DeKol	Jersey	999.27
Colantha 4th's Johanna	Holstein	998.34
Spermfield Owl's Eva	Holstein	998.26
Eminent's Bess	Jersey	993.25
Spotswood Daisy Pearl	Jersey	962.82
Jacoba Irene	Guernsey	957.38
Olympia's Fern	Jersey	952.96
Miranda of Mapleton	Jersey	937.83
Creamelle Vale	Guernsey	927.16
Auchenbrain Brown Kate 4th	Ayrshire	917.60
Aralia DeKol	Holstein	913.86

In addition to the foregoing, one of the Jerseys, Sophie 19th, has a second record of 931.97 pounds butter-fat produced in one year. Although far down the list in butter-fat, the Holstein, Creamelle Vale, holds the world's record for milk, nearly 1½ tons produced in 365 days.

FEEDING OF SHEEP

The Management and Feeding of Sheep, by Thomas Shaw, late professor of animal husbandry at the University of Minnesota and author of several books on sheep breeding, cattle feeding and dry farming subjects, published by Orange Judd Company, New York, at $2 net. The Cultivator will be glad to secure the book for its subscribers at the above price or, including a year's subscription to the Cultivator, at $2.75 postpaid.

This is a magnificent book for the wool or mutton grower. There are some 470 pages, well written, well illustrated, with complete table of contents covering 27 pages, also an index. The book is dedicated to all students of agricultural colleges and to all persons interested in growing sheep. There are 21 chapters, a few of which we may mention to give an idea of the contents. They are: Sheep as Improvers of Soil Fertility, As Scavengers, For Wool, For Mutton, Wool Described and Classified, Lambs From Birth Until Weaned, Feeding and Care of Breeders, Fattening While Grazing, Milk Lambs, Obtaining and Marketing, Fitting for Exhibition, Washing and Shearing, Marketing, Protecting, Ailments, Dipping, Establishing a Flock and Improving It.

The author says in his preface:

"In writing this treatise, the author has aimed to give in orderly sequence and in simple language the subjects discussed and everything pertaining to the discussion of the various phases of these. The effort has also been made to discuss both feeding and management with such fullness and comprehensiveness as would not be inconsistent with conciseness of statement. The breeds of sheep, the general subject of breeding and the general principles that relate to feeding are not dwelt upon, as these have been discussd at some length in works previously written by the author."

Prices of all kinds of live stock continue to advance in the Sacramento Valley. The abundance of feed and the shortage of cattle, sheep and hogs because of the past two dry years are partly responsible for this. Another reason is that many farmers on 10, 20 and 40 acre farms are getting feed—lots of it per acre under irrigation—and as fast as the feed develops there is a demand for something to feed it to. Dairy cows are in great demand—and in the Princeton, Butte City and Willows country in Glenn and Colusa Counties, $100 is getting to be a common price for fairly good dairy cows, with some selling as high as $125. This is not for the big producers that have been selling for these figures for some time, but for just ordinary cows.

MODERN METHODS

Old-fashioned Mother—What is this Montessori system of child education that I hear so much about?

Old-fashioned Father—I dunno exactly, but the keynote of it seems to be "votes for children."

HOT WEATHER
the ideal time
to use a
DE LAVAL
SEPARATOR

THERE IS NO TIME WHEN the use of the De Laval Cream Separator is so indispensable to the profitable production of cream or butter as during the hot weather of midsummer.

THE USE OF THE SEPARATOR at this season usually means the difference between a profit and a loss in dairying. It accomplishes a great saving of butter-fat that goes to waste with any other method of separation and enables the production of a higher quality of cream than is otherwise possible.

MOREOVER WITH A DE Laval the advantages over other cream separators are greatest at this season because the separation is more complete and the cream heavier and more even in texture. De Laval machines turn more easily and the capacity is greater, doing the work more quickly.

IF YOU HAVEN'T A SEPARATOR you can scarcely afford to put off any longer the purchase of a De Laval, or if you have a separator which is not doing satisfactory work there is no better time to discard it in favor of a De Laval, first trying the machines side by side for your own satisfaction, which every De Laval agent will be glad to give you the opportunity to do.

See the nearest De Laval agent AT ONCE, or if you do not know him write direct to nearest office below for any desired information.

BEST FOR CATTLE
Horses, Mules, Hogs and all Farm Animals

Cottonseed Meal

WHEN FED TO FARM ANIMALS it keeps them in a healthy condition—makes good sound flesh and muscle. For fattening hogs, Cottonseed Meal has no equal. When fed to chickens the results are remarkable—hens lay more.

Read the following from Mr. O. B. Fuller:

Willits, Patterson & Green,
Los Angeles, Calif.

Gentlemen:

We have fed Cottonseed Meal for the last four years and have always gotten results. We found it one of the best fatteners for beef cattle that we ever fed, and can recommend it highly to any cattle men that may have use for it.

(Signed) O. B. FULLER.

COTTONSEED MEAL CAN BE FOUND AT MOST EVERY FEED DEALER. SEND FOR INTERESTING FREE BOOKLET.

Books

This list of helpful, instructive and interesting books is prepared by us with the purpose of enabling the Cultivator readers to supply themselves at the lowest possible cost. The great value of many of these is so well known as to need no comment from us. Some of the new books which we have added to the list this year deserve special mention. "Co-Operation in Agriculture," by G. Harold Powell, should be in the hands of every producer of farm products. "Farm Sewage," by Santee, will aid many in solving a perplexing problem. "Farm Manures," by Thorne, is decidedly valuable. We state sincerely that no orchardist can afford to get along without "The Pruning Book," by Bailey. We have had much inquiry for a book on keeping farm accounts—we can supply a good one now. The imported book, "Insecticides, Fungicides and Weedkillers," by Bourcart, is a marvel of completeness. The rapidly increasing use of gasoline engines, automobiles and tractors by the farmers has demanded reliable treatises on these subjects. "The Gasoline Engine on the Farm," by Putnam, "The Modern Gasoline Automobile," by Page, and "Traction Farming and Traction Engineering" are exceptionally complete, well illustrated and easily understood. Don't overlook the "Cement Workers' Handbook"—it's "worth its weight in gold." Every book on this list has the endorsement of the California Cultivator.

Irrigation and Forestry

IRRIGATION OF GRAIN CROPS

Written for the California Cultivator
By N. C. Grider.

That it pays to irrigate crops of hay and grain when the spring rainfall is below normal was proved beyond a doubt by one of the sugar companies operating in Yolo County during the spring of 1913. Six hundred acres were sown to red oats and barley, and owing to the insufficient rainfall the crop promised to be a total failure. The company resorted to irrigation and the returns from the experiment were better than hoped for.

One field of 300 acres, of which 240 were in red oats and 60 acres in barley, was served by a ditch giving us a head of 16 second feet. A plot of four acres was not irrigated. The time required to complete the irrigation was 428 hours, making an application of 1.9 acre feet. The water was crowded over the land as rapidly as possible, but there being very little slope the flow was retarded by the crop. There was a very thick stand (100 pounds per acre was sown). Irrigation was begun on the 23rd of April, and, as there was hardly more than a sprinkle of rain after that date, the crop was completely carried through by the irrigation. The main ditches were already in the field and the laterals were constructed by means of a road grader at a cost of $36. The water company's charge of two dollars per hour amounted to $856.00. The cost of labor and supplies was $219.75, making a total of $1111.75 or $3.76 per acre. Two hundred thirty-six acres of red oats produced 629 tons of hay and 60 acres in barley produced 120 tons, making a total of 749 tons from 296 acres. The four acre piece that was not irrigated produced two tons of oat hay, an average of .5 tons per acre. The hay produced was of excellent quality and after being baled sold readily at a price ranging from $13 to $17 per ton.

Using a net valuation of $10 per ton for the barley hay and $12 per ton for the oat hay, the following table shows the profits due to irrigation:

Crop—Oat hay, per acre irrigated, $2.67; per acre unirrigated, 50 cents; increase per acre, $2.17; value of increase, $26.04; cost of irrigation, $3.76; profit due to irrigation, $22.28.

Crop—Barley hay, per acre irrigated, $2.00; per acre unirrigated, 50 cents; increase per acre, $1.50; value of increase, $15.00; cost of irrigation, $3.76; profit due to irrigation, $11.24.

The records of the other fields gave corresponding results. The writer does not maintain that irrigation would show such profits for seasons of normal rainfall, and the question of irrigation of grain crops is one to be decided after a study of conditions, such as cost of applying the water, probable increase of crop and market value of such increase.

WOULDN'T IT?

Holding a glass of clear honey in his right hand, father observed impressively: It costs the little bees many a weary trip to fill this with sweetness from the flowers." Little Laura, who had been listening closely exclaimed with great earnestness: "Wouldn't it have been too bad if one of them had dropped the glass."—Judge.

IRRIGATION CONGRESS

The twenty-first session of the International Irrigation Congress will be held at Calgary, Alberta, Canada, October 5 to 9, inclusive, 1914. This session will be the first one to be held without the borders of the United States since the congress was organized at Salt Lake City in 1891.

To the people of Canada this meeting offers an opportunity to repay the hospitality which has been extended them at previous congresses; to make known their natural resources and undeveloped riches; and to learn the wisdom which other countries have acquired from irrigation.

The people of the United States are offered an instructive trip to an interesting neighbor country; an opportunity to see that land of which they read so much; a chance to learn of the progress this country has made on lines which still perplex many of the states; to compare advantages of the two countries; and above all, to learn if they cannot do in their own country, to keep their people home, those things which their neighbors to the north have been doing so successfully to attract them.

To the people of the world this twenty-first meeting of a great organization offers a clearing house for the information, experience, practices and results of irrigation, as developed throughout the vast range of arid and semiarid lands which have been brought under subjugation by man.

SUDAN GRASS

Sudan grass was imported into Texas in 1909 and tried out at Chillicothe, and then at the Lubbock experiment farm. So successful has it been that seven farmers planted a total of 25 acres in 1913 with remarkable results.

It has been found to yield from three to five tons of hay and from 400 to 600 pounds of seed per acre. The hay is valuable because it is a great drouth resister, it makes excellent feed, stock eat it readily and it is not a pest as it must be planted each year. As the seed is somewhat similar to Johnson grass it is well that in buying the purchaser should go to those who will give him pure seed.

Sudan grass is usually planted in three foot rows, sowing about one and one-half pounds per acre. When wanted especially for hay the grass should be cut just as soon as it is fully headed. The first crop makes the best seed. Seed should not be planted until all danger of frost is over and when the ground has fully warmed up. Plant it by itself, as it readily crosses with all sorghums, Johnson grass, etc.

The county farm adviser movement has taken another step forward in Missouri. A homemakers' club has been started in one county, and it is announced that funds will be raised to employ a lady county agent to work with farm women in solving some of the difficult problems of home economics. Other counties in that state are discussing the same question. One worker for the movement says: "We want and will have a woman who will be to every home, but especially to the farm home, to the school, the girl and the home maker, what the county agricultural agent is to the farm, the boy and the farmer. We are not decided what to call her or just what her manifold duties will be, but we want a specialist who will come into our homes and schools and do everything that is possible to be done to better conditions of living on the farm and bring efficency into every phase of home keeping." The determination and sanity which marks the attitude of these ladies will almost surely bring success and may mark the beginning of a country-wde movement.

Profit in the Poultry Yard

TEN TURKEYS FROM TEN EGGS

Written for the California Cultivator
By Jean A. Koethen.

To raise 10 turkeys, even in what is considered a bad season, is not much of a feat; neither is it in the least unusual to hatch 10 strong poults from a clutch of 10 eggs, though I have never been so fortunate before, but to put 10 eggs under a hen, to have 10 poults hatch so nearly together that no one could say which was last, and to have every poult alive and husky at the end of a month is an achievement of which I think I have a right to be proud. Hitherto I have been groping, in common with hundreds of other people, for the magic key to turkey raising; now I feel as that old Greek philosopher must have felt when he jumped out of his bathtub and ran through the streets shouting "Eureka! I have found it."

To be sure, my turkeys are not raised yet, and with turkeys there is many a slip before they cross the line of safety at three months of age. but only lice or corn or gross overfeeding will kill them now, and after the self-restraint I have practiced the last month in the matter of feeding I am not likely to overfeed now. As for lice, I dust them every week with buhach powder — rub it into their feathers and under their wings till they are yellow all over—and dust the hen every time I dust them, or oftener.

There's nothing harder for a woman who is accustomed to feeding chickens and children than to steel her heart against the hungry "peep, peep," of baby turkeys. They are so ingratiating, too, running to meet her every time she appears, following her as long as she is in sight, and jumping on her lap if they have a chance. It takes a lot of self-control to feed the tiny, tiny meal they can digest and let them go on crying.

There is a trick, you know, in every trade, and the raising of each kind of fowl has its "open sesame." With chicks it is warmth and exercise; with ducks, soft food and enough of it; with turkeys, cottage cheese and very little of it. I have thought—and said—that poults could be raised without cottage cheese, but since I tried raising a brood of eight without it and buried six of them before they were two weeks old, I am not so sure. Unquestionably, I overfed that unfortunate brood; people do raise them successfully without cottage cheese, but I suspect it is only on very good range, where the poults may be left to nature.

"It's the nature of turkeys to pick up their feed," said an old lady to whom I was recounting my turkey experiences, "When I was a girl, back east, our hen turkeys used to hatch their broods and take them away into the woods. They stayed there all summer and we never saw them till frost came. Then we went and brought them in, and such turkeys you never saw!" There is the secret of raising turkeys. "Picking up their feed" is the magic word. Unfortunately we have very little such range here in California as those turkeys had, but the more nearly we can approximate nature's method, the better for our poults.

Probably it was my failure with the first brood that made me resolve to raise the second or die in the attempt. When I looked into the nest that morning and saw those 10 lively poults, already beginning to ask for food, I said, "I'll starve you, but I'll raise you," and I began by making them wait 48 hours for their first meal. They were on the ground where they could pick a little, and had sand and water, nothing else. It hurt me worse than it did them, but I let them wait.

The pen I put these poults and their Buff Orpington mother in was ideal. It was a small pen which had been planted to grain last fall and not used since. Part of the grain had been cut and part was standing, so they had some litter to scratch in and something to pick at. The pen was sheltered from the west wind and got the first beams of the morning sun.

That first week was foggy and rainy after the first day or two. Several nights we had to carry the coop into the feed house and several mornings the little fellows had to stay shut up till the ground was dry enough for them. This is the sort of weather that is supposed to kill young turkeys, but these stood it splendidly. When the coop was outside I took care that first week to shut hen and poults in at night so that they could not get out while the ground was damp. After about a week the poults began to crawl through the fence into the chicken yards, so I transferred them to a wire coop on the clean new oat stubble on the adjoining lot. The hen was confined to the coop, and the turkeys came and went as they pleased. As the poults grew older I let the hen out in the middle of the day, but she still stays in while the fog is on in the morning, so that she will always be there to hover the poults when they need her. When I look out at half-past five or so in the morning I see the poults scattered over the stubble, hunting bugs, while Mrs. Orpington sits in the coop with outspread wings, ready to cover any chilly youngster.

I was much puzled, when I first began to raise turkeys, to know what to do about the hen. So many writers object to letting the chicken hen raise poults, because she feeds them too much, or drags them around too fast, or is infested with lice, or takes them into the wet grass too early in the morning. I tried one brood in the brooder and I want to say to any one who is perplexed as I was by all these criticisms of Mother Biddy; "Don't believe them. A hen needs managing and some hens are not fit to be mothers of chickens, let alone turkeys, but a good, quiet, motherly hen is better than any brooder, if she is properly managed." With a large brood of turkeys and just the right sort of brooder one might be successful, but the turkey needs even more than the chick the peculiar hovering warmth of the old hen's wings, and a little common sense on the part of the attendant will make up for what the hen lacks in intelligence. She doesn't know any better, to be sure, than to drag her babies out in the dewy grass at five o'clock in the morning, but it is not necessary to let her. If she is given feed for them, she may feed baby turkeys to death, but it is not necessary to give her feed. If she is not dusted she will probably have lice, but why not dust her? Nothing is easier. It is only a question of dusting her often enough.

To come back to the feeding, which is, after all, the main thing: I had said over and over, "Keep them hungry," "Feed always less than they want," even when I was feeding my first brood to death. It is a difficult matter to draw the line between too little and too much unless you have some rule to go by, and most of the printed instructions on turkey feeding are painfully indefinite. Just about the time this brood was hatched I found in an article by a Missouri woman this rule: "Do not give more than a heaping teaspoonful to 15 poults, five times daily." A teaspoonful! Just think of it! It seemed incredibly little. Nevertheless I tried it. That is why my poults are all alive.

The mixture I gave, after the first feed, which consisted of rolled oats scattered on the sand, was made up of the results of all my reading, yet different from anything I had read. I first chopped an onion (a young one), a little tender lettuce and a small piece of very stale cracked wheat bread together. A teaspoonful of this mixture was mixed with a teaspoonful of cottage cheese and a little fine chick grit added. At first, as the weather was damp and chilly, I sprinkled in a little black pepper. One teaspoonful of this mixture made a meal the first day or two, but the poults were so hungry I soon increased it, though I did not go over two teaspoonfuls for a week or perhaps more. In the matter of amount one must use judgment, and be guided by the hunger of the poults. After a day or two I began to mix in a little pinhead oatmeal, which is a fine feed for both turkeys and chickens, and put grit in but once a day, though they had it before them till they were put out on range. Sometimes I mixed in cracked wheat for the evening meal, but the cracked wheat which was sent me contained a little corn, and I feared to use it without first picking out the corn.

The hen is a problem when one feeds such a small amount. The books say, "feed her by herself," but that is easier said than done. I finally decided, since my hen would not eat alone, to let her go hungry, and in what I fed the poults, no allowance was made for her. She would taste, that was all, and they ate everything up so quickly she had no chance. After perhaps a week I began throwing a little wheat into the coop for her. The poults did not care for it at first, and now they are gradually learning to eat it, just as they should.

When bread is used, it is very important that it be really stale and merely dried or toasted. I don't think the kind matters as much as its dryness. If one has not really stale bread, it is better to use rolled oats.

After about ten days, I cut down the number of feeds per day to three, though I continued to give either a head of lettuce or chopped lettuce and onion tops between meals. Some people never give more than three meals a day, but it seems to me it is more according to nature to feed a very little and feed it oftener,. just as the poult, if left to the care of the turkey mother, would pick and eat and pick and eat. Of course, when I decreased the number of feeds, I increased the amount but they were on the stubble by this time, with access to an alfalfa patch, and I could see by feeling their crops that they were picking up a good deal, so I still kept them hungry.

Now at four weeks of age, my poults have rolled oats and wheat for breakfast, a head of lettuce in the middle of the forenoon, cottage cheese with the chopped green (always some onion) and a little oatmeal or cracked wheat at noon, and at night either cottage cheese or hard boiled egg with green and the wheat and rolled oats. I want to work them on to cooked liver instead of cottage cheese, but they like the cheese so much and it is so good for them it is hard to make the change. Hard boiled egg I do not care much for, but it makes a little variety, now they are old enough to stand it. It was boiled egg that I fed my ill-fated first brood on, and they all died of diarrhoea.

I do not know that it is necessary to feed as much onion as I have given, but it is safe, and onions are cheap —cheaper than medicine, a good deal. Cottage cheese is said to contain an acid which kills, or at least prevents the multiplication of, the bacteria which are found in the intestines of all young fowls. Onions keep the liver, which is the turkey's weak point, in order. Warmth, dryness, clean quarters and clean bodies furnish the environment which conduces to healthy growth. Exercise does the rest. It is all very simple once you have learned the lesson, but so hard to learn except by doing the wrong thing first.

FOR GROWTH AND EGGS FEED
STANDARD A EGG FOOD

Standard Egg Food is composed of the best mill feeds, fish meal, meat scraps, bone meal, soy bean meal, oil cake meal, granulated milk and charcoal, properly proportioned.

Standard Egg Food should be fed as it is in a hopper and kept before your fowls at all times, but may be fed wet if preferred. It will make eggs.

PEERLESS POULTRY SUPPLY CO.,
409 E. Third Street
Los Angeles, Cal.

FISH
MEAT MEAL
FOR POULTRY

We guarantee:--

1 —Better egg results than from any brand of "beef scraps."
2 —Positively no fish flavor in eggs or meat of birds fed on it.
3 —None of the digestive troubles that many "beef scraps" cause.
4 —Lower mortality among hens fed to force a high egg production.
5 —Baby chicks thrive on it; they don't die, as they often do on beef scraps.

Much benefit is likely to result, without any possible harm, if the hens are compelled to work in clean litter for their grain at all seasons.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Roup

My chickens start in with sore eyelids, only they don't seem to fester but stick together with a yellow water. The eyelids swell so the chicken is unable to see and the lids crack along the edges. I have greased them and put peroxide and boracic acid on them but it doesn't seem to do any good. I have lost four already. Could you kindly name the disease and suggest a remedy. I feed them cracked corn twice a day. They run out all day and have green feed. I also give them milk.—Subscriber.

This is "roup of the eyes," and like all forms of roup it is exceedingly difficult to cure. The easiest method of treatment is dipping the heads of the affected fowls in a one to two per cent solution of permanganate of potash. The nostrils are pressed together between thumb and forefinger in the direction of the beak two or three times and pressure also applied between nostrils and eyes in an upward direction. This helps to loosen the discharge in the nostrils and eyes. The bird's head is then plunged into the solution of permanganate of potash for 20 or 30 seconds. This treatment should be repeated twice a day till all symptoms have disappeared.

Another remedy is the washing out of eyes and nostrils at least once a day with two per cent boracic acid in a decoction of camomile flowers. Personally, I don't believe in doctoring roup. It is almost always caused by either too close sleeping quarters or a draft on the head through a crack or a knot hole. Stop up the cracks; put your chickens where they will have as much air as you like yourself; cleanse the eyes once or twice with some antiseptic solution; then if they do not improve in a few days, kill and bury deep. Fowls that have once had roup are of very little use afterward and should never, under any circumstances be used as breeders.

Cracked corn alone is not a good ration, especially in summer. Wheat or rolled barley for the grain feed is better, with a pan of bran and beef scrap or fish scrap to nibble at between meals. If they have all the milk they want the beef scrap may be omitted. Use one part beef scrap to seven or eight of bran.—J. A. K.

FOR THE "LAND'S SAKE"
BUY A
BOSTROM IMPROVED FARM LEVEL
Price $15
which has TELESCOPE enabling you to read the Target over 400 yards away, and
TERRACE, DITCH, TILE DRAIN, IRRIGATE
your land properly, and save surveyor's fees. It is sold by up-to-date hardware and general merchants everywhere, and guaranteed to be the most
SIMPLE, ACCURATE, DURABLE AND COMPLETE
outfit ever made for all farm work. If your dealer hasn't one in stock, he will order for you from a nearby hardware jobber.

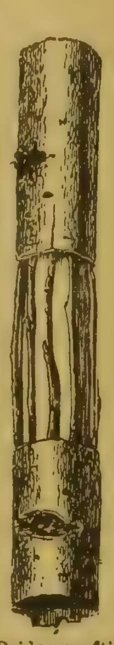
Summer Pruning of Apricots

How can one tell fruit wood on young apricot trees?

The apricot is like a plum in that it bears on old wood as well as the current year's growth. It is difficult to tell at this season which buds will produce apricots and which leaves. Severe spring pruning or that done at this season will develop the fruit buds materially. Do not summer prune one or two year old trees of any kind. It retards their growth.—J. W. M.

Girdled by Gum Disease.



Bridge-grafting of a girdled trunk.

In caring for young trees suffering from gum disease will you kindly advise if there is any known cure for a tree after it has once become girdled? I have heard that with some plants a cure is effected by putting strips of freshly cut, healthy bark across the girdled portion and connecting each end of the strips with the healthy bark above and below the part girdled, after which the strips are tied securely in place. Would this treatment be advisable with citrus trees? — Subscriber, Exeter.

Where the tissue is so diseased that it has been completely girdled the under or cambium layer of bark would be destroyed and strips of healthy bark laid over would not attach and grow to the dead tissue, nor to the hardened and mature wood of the trunk. We have, however, seen gophered trees taken immendiately afterward while the moisture was still in the cambium layer and it was in fairly fresh condition where "skin grafting" was followed with success. If the tree is in fairly healthy condition we would suggest scraping or chiseling away the diseased tissue and painting with Bordeaux paste. (See issue of the Cultivator of January 22, 1914.) Then secure scions from a healthy young tree, say larger than a lead pencil, and "bridge graft" these in, beveling off ends to secure perfect bark contact. An idea of the method may be had from the engraving. Tie firmly both the top and bottom, and waxing aids in preserving the trunk.

Apricot Scab

I am sending you some apricots badly infested with brown scale. It was so bad in some orchards this year that the canneries refused to handle the fruit. I am told it is caused by the damp and cloudy weather of this season and that in ordinary years there is very little of it on the fruit. Kindly give remedy and time of application.—Subscriber, Ontario.

We do not find any scale, or rather scale insects, on this fruit, but it has been seriously affected with scab caused by a fungus growth. Bordeaux mixture applied when the trees are dormant is a preventive and in a season like this it would have been an excellent thing for the fruit. There is no treatment which can be given to the fruit once the trouble appears. As a rule it does not appear with sufficient regularity to make spraying every year profitable. It has been worse this year in all parts of the state.

Grass Named

I enclose specimen of grass which grew on vacant lot here, where it attained a length of five and one-half feet wthout any irrigation. Would you please give me its name and tell me whether it is regarded as of any value as a forage plant?—"Ignoramus," Pasadena.

This is Lolium temulentum, a European grass, not desired there as forage and believed to be deleterious to milkng stock.

Layers or Roasters?

This spring I embarked in the poultry business, have successfully raised 250 Leghorns and am now at a stage where I have considerable time, some money and an idle brooder house on my hands. Which, in your estimation, would prove most profitable, considering that I am unable at present to hatch my own chcks, and must pay 10 cents each for them: To raise Leghorns, keeping the pullets for spring and summer layers and getting twice as much for my cockerels as for the spring hatched; to raise a heavier bird and sell pullets and cockerels for broilers; what month would be best to get them started?—Subscriber.

If you can get good, hardy, fast growing stock for 10, or even 12½ cents apiece, it will probably pay you best to buy chicks of a heavier breed and raise them for soft roasters or fryers. September is the best month for fall hatching. Every chick should be out of the shell before October 1, for the later chicks feel the effect of the rains, which sometimes come in November. Chicks hatched in September reach broiler size between Thanksgiving and Christmas, when there is little market for broilers. If they are kept till the first of Februrary they will strike a splendid market, for the Christmas roaster demand is past and the spring broiler market still ahead. Farmers of the South Shore district in Massachusetts have built up a notable roaster business, hatching chicks n the late summer and marketing them in the early spring, and it is a wonder more Californians have not learned the trick. Any heavy breed will answer for this purpose, but they must be good, hardy stock. Everything depends upon this. If you can get the chicks when you wish, try to have them all about September 1. September is always a hot month, and you can raise them in fireless brooders. The objection to raising pullets for spring and summer layers is, that they begin to lay too early—that is, before they have the size they should have—and lay too many small eggs.—J. A. K.

Ration for Horses and Mules

How many pounds of rolled barley, good grain hay (mostly barley) and alfalfa hay, equal parts, would you advise feeding 1400 to 1500 pound horses and 1100-pound mules doing hard work? I have difficulty in convincing ranch teamsters that horses should not be fed all the hay they will eat.—Subscriber, Lindsay.

Horses and mules cannot stand doing hard work for any length of time when fed hay only, no matter how good the qualty of this is. The heavier the work they are doing, the greater proportion of the ration must be composed of grain. Horses of the weight given, when doing heavy work, will require somewhere around 12 pounds of grain and 12 to 15 pounds of hay per day to keep them at an even body weight. If equal parts of grain hay and alfalfa hay are fed, a mixture of barley and oats, or barley and wheat bran, will be likely to give better results than barley alone, but rolled barley will probaby be considerably cheaper than mixed grain at current market prices for grains; if barley is fed as the sole grain feed it may be well to reduce somewhat the allowance of grain hay and to feed more alfalfa. Mules doing heavy work may be fed 10 to 12 pounds of grain and 12 pounds of hay daily. They take less kindly to barley than do horses and may therefore be fed either of the grain mixtures given to good advantage.—F. W. Woll.

Drying Figs.

Will you tell a Northern woman how to prepare figs for home use by canning, preserving, etc. Also, is there an opportunity for a farmer's wife to prepare them for market? If so, how?—C. A. V., Laveen, Arizona.

As to drying, would refer the subscriber to articles in last week's Cultivator. Of course, there is always sale for well cured figs and in Arizona we doubt not there would be a market for all that might be offered. As to preserving, pickling, etc., this week we are giving recipes in the household department of the Cultivator. In regard to a market for these, that would depend upon local conditions. Would refer the subscriber to the article by Mrs. Roberts of Grass Valley in the Cultivator of July 2nd regarding the canning of cherries, pears, peaches and fruits of that description and the market she secured in the Hawaiian Islands. Our inquirer refers to being a Northern woman. Perhaps her own neighborhood in the North would appreciate the opportunity of securing home canned figs, preserves and pickles, and orders might be taken and several hundred cans disposed of in that way. The same issue in which Mrs. Robert's article appeared also contained a fund of information regarding canning. Either tin or glass may be used. Of course the tin is to be preferred if railroad shipments are to be made. Where personal deliveries can be made or care exercised in packing glass might be used.

Dried Fruit for Home Use.

Is it best to dry peaches and apricots for home use without sulphuring? If sulphuring is better how may it be done on a small scale?—Subscriber, Fallbrook.

If good ripe fruit is dried it is sure to turn very dark before it has cured sufficiently to store away, and when it is so dark it does not make an attractive dish on the table. Argue as we may, we still "eat with our eyes" and unattractive things on the table are not an aid to the appetite, so if sulphuring can be done and it will make our fruit more attractive and still be healthful, by all means sulphur. For our own table most emphatically we wish sulphured fruit, providing the sulphuring is properly done. It gives a golden appearance and where fruit is washed before cooking the infinitely small amount of sulphur dioxide remaining would not be injurious. One can make a sulphur box very cheaply of matched lumber with cleats along the side for pushing in the trays one at a time, the same as drawers, and after filling a pit may be dug for placing the sulphur underneath. The sulphur may be lighted by pouring a bit of alcohol on, or if far enough below the tray so there is no danger of fire a wisp of paper may start it off. Another form of sulphuring house is to make a light frame and cover with tarred or building paper. Use care in tacking so that it is as nearly air tight as possible, then the trays may be stacked on the ground or over the sulphur pit and when all ready to light the sulphur the little box may be lifted by conveniently arranged handles and placed over the stack of trays. A few shovelfuls of dirt around the sides aid in making it air tight.

"Pusley"

Through the planting of unclean clover seed pusley has started in my lawn. Have hoed up and killed everything but the pusley, but in spite of all my efforts the latter is spreading to adjoining ground. How may I exterminate it? Does it propagate by seed or from the roots? Though I dig up and burn every sprig I can find it seems to come thicker than ever.—Subscriber, Manhattan Beach.

Certainly our subscriber is situated so as to appreciate the good old expression, "meaner'n pusley." He seems to be doing about all it is possible to do, for it is practically a case of persistence and hard work when it comes to this pest. By all means continue the burning or disposing of the weeds as soon as pulled for the fleshy stem of the purslane plant contains sufficient nourishment to continue ripening the seed for weeks after it is pulled out of the soil, so either burn or put into the poultry yard, for it is a good poultry food, or compost and secure sufficient heat to rot down the seed. The only way to dispose of the seed now in the soil is to allow it to sprout and then continue pulling out and destroying. If the seed came in clover seed which was secured for the lawn the seed dealer who was so careless as to sell such stuff should make the loss good. It does not propagate from the roots.

Dried Peaches.

How are peaches dried for commercial purposes? Is the use of sulphur permitted?—Subscriber, San Gabriel.

Sulphur is still used though all growers are urged to sulphur as lightly as possible and handle so that the fruit will not require sulphuring after drying. Sulphuring after drying is what caused all the trouble a few years ago with the department of agriculture. The fruit is cut, laid on trays cut side up, and some orchardists prefer to spray slightly with water just before putting into the sulphur house. This is not so essential, however, if fruit is quickly put into the sulphur house after cutting. Too long a period should not elapse between cutting and sulphuring as the fruit is liable to darken. To give plans and specifications for best house and yard for handling of fruit would require several drawings with plans of yards, trackage, etc. In a word, appliances should be at hand to permit of as economical handling as possible. Manufacturers are putting out portable railways and cars, with turn tables, which make the handling very economical. The sulphur house is built of exactly the right size to take one dry yard carload of fruit. Some large yards run a dozen or more of these sulphur houses at a time. The fruit is put into the sulphur house after spraying. The sulphur is placed underneath the trays and far enough below the lower one so that there is no danger of setting on fire. In fact a small pit is usually dug, with entrance or draft frrom one side. Some keep the sulphur house perfectly tight from the start, others prefer to ventilate so as to secure thorough charging of all the air within the box. After sulphuring has been going a few minutes all the vents are closed and the fruit kept in the fumes in the tight box from 30 minutes to two hours. The difference in time depends upon the kind of fruit, condition as to ripeness, etc. Here is where experience will dictate the method of control. The sulphuring not only makes the fruit of a more attractive color, because of the bleaching, but facilitates drying since sulphured fruit will dry in almost half the time required by the unsulphured.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Fistula in Goat's Udder

Have a milk goat that gives milk from one teat that leaves a reddish brown sediment after it stands a few hours, about a small teaspoon to a quart of milk. There is a small growth or sack-like object on the inside and about three inches from the end of the teat. When I first found it I found that my forefinger pressed in it while milking and that there was a slight secretion on the outside when I squeezed it, but no opening on the outside apparently. Since then I do not touch it when milking and the residue is gradually growing less. I have only had the goat a week and have had no trouble of any kind with her so that she could have been hurt. The former owner says he never has found anything the matter with her milk and has sold it for babies' use. Can you recommend a cure from description or will a veterinarian have to examine the goat?—Subscriber, Sherman.

As you say, the trouble has probably been there for some time. It may have been caused by a bruise, but from your description, whatever caused it, there is a sack between the outer skin and the inner lining of the teat and there is an opening from the sack into the milk duct. The sack secretes the reddish brown matter that settles to the bottom of the milk and since you are more careful not to squeeze the bunch when milking you are forcing less of the matter into the milk. The only remedy that would suggest itself is an operation. By splitting the skin from the outside and dressing the inside of the cavity with a caustic it would probably heal all right. The only bad result that might follow such an operation is that the milk may come out through the opening and cause a milk fistula. If you wait until the goat becomes dry the danger of milk fistula would be reduced to a minimum. While the matter in the milk might not be injurious to one's health, still one would not care to use it for food. It seems that the former owner should be willing to take the goat back and return the money if you wish him to do so or make it right in some way. It will be necessary to have a veterinarian operate, as they are familiar with such conditions and know how to dress the wound.

Rabbits Affected

I have some rabbits with a sort of disease in their ears which makes scabs. The disease does not get any better nor much worse. Otherwise the rabbits seem to be in perfect health. They are lively and eat well. —Subscriber, Anaheim.

The scabs are probably caused by a small mite working in the skin. Soak a small sponge or cloth with engine oil and rub it over the scabs until the parts are well soaked. Repeat the application in a few days. Three or four treatments will probably be sufficient.

Skin Disease

I have a cow three years old. Since I have had her, which is now a year, she has had sore spots on various parts of her body which are about the size of a quarter. The skin on her neck and shoulders is very rough, but at times the roughness has disappeared. My neighbor says they call it surface hide. She has been fed alfalfa and oat hay. Kindly give treatment.—Subscriber, Covina.

The trouble is probably due to a fungus similar to that which causes ringworm. Try crude oil rubbed in well. If that does not cure it in two or three weeks then have your druggist prepare an iodine ointment as follows: Iodine crystals, two drams; tincture of iodine, two ounces, and enough lard oil to make four ounces. Wash the parts clean and apply the ointment twice a week.

MONEY MAKING LITTLE LINERS

In this department we will insert your advertisement under a classified head for 12 cents per line per issue. No ad accepted for less than 3 lines. Our classified columns are the clearing house for our many thousand readers.

MACHINERY

SECOND HAND WINDMILLS, TANKS, PIPE PUMPS ENGINES
RANCH AND POTATO MACHINERY

New 1000 gallon galvanized tanks, $19.50; 2000, $29.50; 8-foot steel mills, 19.50; 10-foot, $29.50; 12-foot, $45.00.

HAY MACHINERY

Fine Gem baler, $125.00; La Dow baler, $95.00. Whitman Power baler, mowers, rakes, binders, headers.

POTATO MACHINERY

Potato diggers, planters, cutters, cultivators, harrows, plows, Holt tractor, sprayers, sundries.

ENGINES AND PUMPS

Special Sale: 8 H. P. Stearns, $135.00; 20 H. P. Stearns, $195.00; 28 Lambert, $295.00; 35, $350.00; Ames double acting, deep well pump, $135.00; single acting pumps, $20.00 to $60.00. Centrifugal pumps half price.

SUNDRIES

Bankrupt sale new stocks and dies half price; gears, large pipe fittings, pulleys, belt.

HOW'S THIS?

Biggest little Pumping Outfit ever sold at the price, 2½ H. P. horizontal engine, upright jack and belt, new, $98.00. Capacity 1200 gallons, 100 feet. Demmitt Co., upstairs, 120 N. Main, Los Angeles.

We have pumps, motors and engines of all sizes and for all conditions, which we will sell or rent. If you want a complete plant or any part, write us your needs and get our prices. Can give you special low price on engine and automobile oil, also belting Machinery & Motor Exchange, 756-768 S. Alameda St., Los Angeles, Cal. Main 6382.

For Sale—Used and new gas engines, 2 H.p. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild gas engines correctly. Get our prices. Lloyd, 806 N. Main, Los Angeles.

LIVE STOCK

Ohio Improved Chester White (O. I. C.)—A few male pigs of March and April farrow. Everything else sold. Have a limited number of sows bred for October farrow. Am booking orders now for these. All stock cholera immune. Crated and registered free. C. B. Cunningham, Mills, Sacramento County, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor, Mayhews, Sacramento Co., California.

For Sale—Small dairy complete; retail route; income $375.00 per month. Price, $2,500.00. Half cash; balance terms. Sickness; must sell. C. A. M., Box 361, Azusa, Cal.

Thoroughbred Berkshire Boars of all ages from developed and large-boned hogs. Riccomi Bros., Mountain View, Cal.

For Sale—Young, registered Berkshire boars; fine, strong stock, weighing about 150 lbs. Stanislaus Ranch Co., R.F.D. No. 1, Crows Landing, Calif.

Glenview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

SEEDS AND PLANTS

Luther Burbank Spineless Cactus (Only)—Live stock fed on this velvet cactus, grow fat; hens lay more eggs, cows give more and better milk, and horses grow sleek. Why not get a start in the best, costs no more to raise than that which they call just as good. Ten slabs for $5.00, with one fine fruiting sort free. Address or call at H. L. Bauers' Cactus Nursery, 4401 Hammell St., Los Angeles.

$ $ $ $pinele$$ Cactu$. All varieties Burbank's fruiting and forage plants 10c up. Plant now. Black Bros.' Nursery, 455 Lucas, Los Angeles. $ $ $

Berry Plants and Rhubarb. My new Berry Book ready about October will be worth sending for. Louis F. Scribner, R. F. D., Pasadena, Cal.

Thornless Cactus Slabs for sale at 5 to 15 cents each. Chas. R. Hanna, R. D. No. 3, Riverside, Cal.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

RABBITS

New Zealand Reds, prize stock, young for sale; buy now and raise for the winter shows. Mrs. C. A. Richey, R. F. D. 8, Box 557, Los Angeles.

BEES

We offer 200 colonies bees and fixtures with or without 5 acres land suitable for berries, poultry, etc. Cash or easy terms of payment. Will lease for several years with privilege to buy if satisfied. Particulars on request. Spencer Apiaries Co., Box 14, Nordhoff, Cal.

FARM LANDS FOR SALE.

For Sale—26 and [illegible] acres of [illegible] valley land in Ygnacio Valley, Contra Costa Co., Cal., five miles from Concord on the O. A. E. Electric R. R., bordered on two sides by county road, [illegible] two-year old grape vines, [illegible] and [illegible], 2500 eight year old grape vines, [illegible] almond trees, [illegible] walnut trees, Concord [illegible], good [illegible] orchard, good water, all kinds of [illegible], two dwellings, one barn, sheds and outhouses, barn full of hay, farming tools, price [illegible], half cash, rest at 6 per cent. C. A. Tarwater, owner, R. F. D. No. 1, Concord, Cal.

VICTORIA, AUSTRALIA, WANTS SETTLERS
Special inducements, government land, railways; free schools; cheap irrigation, 31 years to pay for farms adapted to alfalfa corn, grains, fruit, etc.; climate like California, ample markets, reduced passages, special excursion next November. Free particulars from F. T. A. FRICKE, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

For Sale—Twenty acres adjoining prosperous town, one water stock in Mutual Water Co. with each acre. Conceded to be the best beet and alfalfa land in the state. About 600 feet from the station and beet dump. Five-year beet contract if desired. Price, $200. M. G. McNeely, Alpaugh, Tulare Co., Cal.

Florida Land—Three Months Free—Subscription to the Indian River Farmer. For truckers, fruit growers, citrus, general farmers and folks who want to know about Florida. Address INDIAN RIVER FARMER, Department X, Vero, Florida.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

Ranches, homes, acres, lots, exchange; send for free list. Wilson Bros., Santa Cruz.

POULTRY

CROLEY'S POULTRY CONDITION POWDER

is a wonderful help during the molt.

Try some. Your dealer has it.

How to Make Money—Mrs. A. Basley's latest Poultry Book is without exception the best ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1. Order from Cultivator Publishing Co.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., successors to Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

Barred Rock Cockerels (Hawkins' Royal Blue Strain) ready for fall mating. All the popular breeds of baby chicks every week after Aug. 15th. Order early and avoid the rush. Enoch Crews, R. 1, Santa Cruz, Cal.

Baby Chicks—Jumbo egg strain. White Leghorns, $9; best Anconas, $12; Brown Leghorns, $9; White Minorcas, $12 per 100. Sand Ridge Hatchery, Kerman, Cal.

Barred Rock and R. I. Red baby chicks. If you want to raise some broilers send we your order. Price $10.50 per 100 until September 15th. J. W. Lyon, Gardena, Cal.

White Minorcas—The most popular utility breed of today. Prolific layers of large white eggs. Baby chicks, $12 per 100; eggs. Order early. E. Cauble, Kerman, Cal.

Barred Plymouth Rocks — "None better." Special prices for May and June. Write for 'em. C. H. Vodden, Los Gatos, Cal.

Thoroughbred Plymouth Rock Cockerels for Sale—$2.00 each. Very fine stock. R. E. Threlkel, Folsom, Cal.

TREES.

For Sale—One and two-year-old Washington Navels and Valencia Orange Trees. Eureka Lemons and Marsh seedless grapefruit, for Spring 1914 delivery. Write for prices, or call and examine stock at Morris Citrus Nurseries, Cor. Juanita and Valley Center, R. F. D., Box 34, San Dimas, Cal.

The 1200-Acre Nursery, growers of 1500 varieties of trees and plants. OREGON NURSERY CO., Orenco, Oregon. Sales office, 522 Chamber Commerce, Los Angeles, Cal.

1000 Avocado Seedlings—Pots, also can furnish nice plants, bare root, at low price. A. A. Quint, R. D. No. 2, Pasadena, Cal.

For Sale—Eureka Walnut Trees, budded on Native Black Walnuts. Choice stock. Order immediately. Don't delay. Wm. Holve, Fullerton, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

You Future Nurserymen—Write for prices on special stocks of plants to start business with. Ballou's Nursery, Pasadena, Cal.

Budded Citrus Trees and seedlings at fair prices. Will take auto or land. J. P. Butler, Jr., P. O. Box 145, Lamanda Park, Cal.

MISCELLANEOUS.

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

Household Department

WHAT DO THEY SAY?

What do the birdies say of you,
As they chatter upon the tree?
Do you think they are saying, "Those children there
Are as kind as they can be?"

What do the pussy cats say of you,
As they chat on the garden wall?
Are they saying, "Those children are very good;
They never throw stones at all?"

What do your playmates say of you?
Are they saying, "They are so nice!
They never sulk or throw up a game,
Nor ask for the same 'turn' twice?"

What do your teachers say of you,
Do they say, "They learn so well!
They are never late, and they run at once
Whenever they hear my bell?"

If birds and pussies, and playmates, too,
And teachers and parents say
All this of you, I am very sure
You are happy the livelong day.
—Selected.

MR. SWEET SWEET

Written for California Cultivator By Mary H. Thomason

The other day as I went out to feed the chickens I noticed a little canary flying around and around my head with a plaintive little note that sounded like "Hheat, heat!" And then he perched on the chicken fence and repeated his complaint, "Heat, heat!"

I knew he had always said "Sweet, sweet!" before, and that something was the matter, and I looked and looked, and, of course, when you look you nearly always find.

Now, what do you suppose the trouble was? Why, the watering trough was empty so far down that little Mr. Sweet Sweet could not get a drink, and someone had forgotten to let the tap drip! Of course it was dripping soon after that and he sang again "Sweet, sweet!"

But I could not let him get into the "Heat, heat" habit. It is bad for us to form unhappy habits, you know.

It just happened that there was a broken limb in the big pepper tree that was just made to hold a shelf that would hold a pan of water right in Mr. Sweet Sweet's own pepper tree house. And the two little boys who liked to play under the pepper tree nailed a strong shelf on the sawed-off limb and put a pan on it, and do you think the water in it ever gets too low for Mr. Sweet Sweet? But the best of the story is this: Mr. Sweet Sweet brought his family there, and they told their uncles, aunts and cousins and they told all their connections. And now every day that pepper tree is full of canaries, singing as though their little throats would burst, and drinking and bathing and splashing, two and three at a time! And not one of them knows how a cage looks, unless you call the blue sky one. And we think there is a happier note in their song than there is in the songs of the other birds. If you would like to have as many happy birds in your pepper tree as we have in ours perhaps you would like to try our plan.

THE LATEST BY PARCEL POST.

How would you like to receive by parcel post your Sunday dinner cooked to a turn and ready to eat? A young housekeeper last week proved to her family that she had developed into a famous cook. She packed a big box with a roast chicken and "fixin's" and sent it to her home folks in town.

FATHER KNOWS

"My son," said father, "never borrow money."
"Why not?" asked little Jack.
"Because the day is sure to come
When you'll have to pay it back."

TIMELY RECIPES

We have had request in the last week for recipes for dill pickles and preserving figs. Here are some excellent ones. The dill pickle recipes were sent in by housekeepers; the fig recipes are taken from a government bulletin on the fig written by Gustav Eisen:

Dill Pickles.

Dissolve salt in water until you have a brine that will float an egg, then add half as much more water as you have brine. Wash your cucumbers in cold water. Into a stone jar put a layer of cucumbers, then one of grape leaves, and then a layer of dill. Repeat the layers until the jar is filled, pour the brine over all, cover with a cloth, then a large plate, and put a weight on the plate. Remove and wash the cloth occasionally.—S. M. B.

I have a recipe for dill pickles that I learned by experimenting last year and find it the best I have ever tried. It is economical as it saves the expense of buying vinegar, too. Take dill tops with the seed on and make a layer in the pickle barrel and sprinkle over it a small handful of salt, and then put in a layer of cucumbers and another little handful of salt, and then a layer of apple peelings, and so on with dill and apple peelings and salt between the cucumbers until you have your barrel filled. Put a weight on it to hold pickles under the brine. Put in about three gallons of water when you begin to fill your barrel, and every time you put in cucumbers put in some salt as it keeps the peelings as nice and firm as sauerkraut.—Mrs. S. J. Hammers.

Preserved Figs.

Gather figs with stems on just before they are ripe enough to be eaten. Scrape off the skin carefully and drop the figs into a kettle of clear, boiling water and leave half an hour. Then take out and allow to cool with the stems up. Make a syrup of a pound and a half of sugar and a half pint of water to each pound of fruit. Boil until nearly roping; put in the figs carefully and keep them under the syrup while cooking. If other than the natural flavor is desired, put a clove in the blossom end of each fig or cook them with a sliced lemon from which the seeds have been removed, adding a little ginger. The preserves keep well if made with an equal weight of sugar and figs.

Canned Figs.

To three quarts boiling water add two heaping tablespoons soda; dip figs in this water for one minute and skim them out; then wash thoroughly in three or four waters, or until there is no color left in the water. To ten pounds of figs add eight pounds of sugar; add just enough water to dissolve the sugar; when boiling hot drop in the figs, having first selected them with care so as to avoid any that are broken or overripe; let them simmer slowly two hours; remove figs and boil down syrup until thick; replace figs, bring all to boiling heat, can. A few slices of lemon will improve the flavor.

Pickled Figs

To 10 pounds of figs allow four pounds brown sugar, one quart strong vinegar, one large cup of whole spices of the following kinds: Cloves, cinnamon, allspice and cassia buds. Boil vinegar, sugar and spices first; when sugar is well dissolved add the figs and boil until tender. Place all in jars. Pour off the liquid for three mornings; let come to a boil and return to the figs, then seal the jars.

Candied Figs

Use figs not yet fully ripe. Place in glass jars, pour on salt water and steam until soft. Pour off the salt water and pour over the fruit a syrup made of one cup of sugar to three of water. After a day take out, place on wire screens and allow to drip for one or two days in a warm place. Place again in jars or earthenware, cover with a syrup made of one cup of sugar to one and one-half cups of water and leave for one day. Then take out and allow to drain, after which cover with a syrup made of one cup of sugar to one-half cup of water. Allow the figs to remain in this as long as possible, or until required. Take out, drain and roll in confectioner's powdered sugar in a pan made lukewarm. Pack away in boxes in powdered sugar.

Spiced Figs

Peel ripe figs. For 10 pounds of the fruit take five pounds of sugar, one quart of vinegar, one ounce of cinnamon, one-half ounce allspice, one-half ounce cloves, the spices to be tied in a thin bag and boiled with the sugar and vinegar. When the liquid comes to a boil add the figs, a few at a time, to prevent mashing, and boil until they clear. When done put in jars and pour the vinegar over them and seal while hot.

SUMMER WAISTS

Written for the California Cultivator By Aline.

I have seen summer waists made prettier than when new by setting in a vest when they have become too tight across the bust, and any good waist that can be made plenty large enough with a little alteration will last another season.

A white lace waist that is not quite soiled enough to be washed can be freshened considerably by rubbing with magnesia, paying extra attention to the most soiled places and then rolling in a cloth and laying away for several days. When the cloth is removed, shake the waist and brush with a soft brush, and if desired, it can be colored any shade wanted with some good reliable dye for cotton goods. If carefully done it will look like a new waist.

When the lace insertion in a white waist begins to break, whip footing or lace net under it and darn the broken places and it will never be noticed that the insertion is double.

Sleeve irons are a treasure that no woman who does her own blouses can do without; they cost but a trifle and to launder a lingerie waist so that it looks like new is a piece of work that even the most inexperienced can do if she will but give the time. One of the best soap solutions for washing all kinds of white goods, and especially for sheer materials, is made by dissolving some good white soap in about a pint of hot water, then stirring in a tablespoon of powdered borax. When well dissolved, stir enough of this soap solution in the wash water to make a strong lather and avoid rubbing the garment the least bit, even between the hands. Let all the work be squeezing. After lingerie waists are perfectly dry, dip in borax water, using one tablespoon of borax to about one quart of warm water. Wring out and fold in a towel for a few hours, then iron dry and they will be far daintier and more sheer-looking than when starch is used. They also are much easier to iron. All white goods comes out beautifully white by washing in warm suds made with the borax and soap solution. To rub soap over thin goods will thicken the fabric.

KEEPING BRUSHED UP.

A woman who has brought up a big family on a small income, yet has managed to keep mentally alert, says it is due to a Half Hour Club.

This club has as its fixed rule that half an hour each day must be spent in solid reading. There was a leeway of twenty-four hours, after that there was a fine of five cents each day for failure to get through the prescribed reading.

Twice a month the club meets for discussion of the reading done and to collect fines of delinquents and spur them on to fresh effort.

The woman who told of this club says: No one knows what it has meant to me. When you are the one woman in a family of boys, have a bushel basket of stockings to darn weekly, six children to sew for, lessons to be heard, it is a big temptation to stop reading entirely or to fritter spare moments on novels. That half hour a day of solid reading has kept me up with the times, has rested my body and stimulated my brain, and best of all, it has kept me from drifting into a dull woman whom my sons might love, but would pity for her ignorance.

Especially if you live in a small town is such a club of importance. It is easy to stagnate unless a conscious effort is made. The winter season is the time to start such a club among your neighbors. Do not be content with planning a half-hour reading daily for yourself. You will never hold to it without the stimulus of companionship and the broadening interest of the fortnightly meetings.

IMAGINATION.

Have you ever read the poem about the uniminative little girl who

"If told that a chair was a fast motor car
In which she must speed on a journey afar,
Would straightway declare that it couldn't be so;
''Tis a chair, she would say, 'not a car, as you know.'
'But imagine it's one,' they would plead in despair—
It was all to no purpose—a chair was a chair.
And her obstinate humor would break up the play.
It's a terrible thing to be born that-a-way."

Imagination is the power that gives birth to the productions of the poet and the painter. Imagination not only gives us poetry and art, but it also glorifies the commonplace; it lifts us out of drudgery; it makes possible the seemingly impossible. Nowhere do we need the right kind of imagination more than in the home. Stimulate his imagination, and the weary child who wants to be carried home from his walk, comes galloping home on a stick horse. The old way of training children in the schoolroom was to whip them if they didn't keep still; the new way takes the small, restless kindergarten children and turns them into a flock of birds, who, with arms upraised, stretch tired muscles, and fly back to their weaving, happy.

Grown-ups are often ashamed to be imaginative. They are afraid to indulge their imagination lest some one think that they are lacking in dignity. The king's jester in olden times wore cap and bells, and was expected to be as funny as he could be. We used to think the costume was for the amusement of the king; now we believe it was for the protection of the jester. Put a clown's costume on a sober man, and in its shelter he becomes the clown.

Let a poor man imagine he is prosperous, carry himself as if he had money in his pockets, and he finds it easier to get a position.

The wife of President Garfield said she found breadmaking drudgery until she pictured the loaves she was making turning into her sturdy sons and daughters.

The child who can see a fast motor car in the rocking chair has within herself riches which cannot be taken from her. If our children have no imagination, let us try to develop it in them.

"It's a terrible thing to be born that-a-way."—Wallace's.

THE BEST MEDICINE.

Many of the most familiar fruits and vegetables have distinct medicinal values. The proper attention to the things we eat, then, will make them serve both the purposes of food and medicine, and will enable us to save some of the money spent on remedies and doctor bills. The following are some articles of diet which are known to have medicinal qualities:

Apples, carrots and Brazil nuts are excellent for sufferers from constipation.

Asparagus stimulates the kidneys.

Bananas are beneficial to sufferers from chest complaints.

Beets are fattening and good for people who want to put on flesh. So are potatoes.

Celery and onions are nerve tonics.

Cranberries are astringent and correct the liver when it is suffering from inaction caused by overeating.

Dates are nourishing and also prevent constipation.

Grape juice is a laxative, but the skin and seeds are likely to cause constipation.

Honey is a good substitute for cod-liver oil.

Lemon juice is excellent as a gargle for sore throat.

Lettuce has a soothing effect on the nerves and is excellent for sufferers from insomnia.

Onions are conducive to sleep. They quiet the nerves and are good for colds.

Parsnips, like sarsaparilla, are good for the blood and to tone up the system.

Tomatoes are good for a torpid liver, but they should be avoided by gouty people.

Water cress is an excellent blood purifier.—Kansas City Star.

CLEANING LACES.

Few people understand the art of washing laces. Fine laces should be washed as seldom as possible and handled very carefully to prevent the breaking of the very fine threads of which the lace is made.

If lace is very frail, baste to a piece of material before attempting to launder. First, put Ivory soap in cold water and make heavy suds. Now rub soap on lace, but let lie in water a little while; then squeeze in hand to clean, or between the fingers, being sure to rinse thoroughly to remove all soap. Pull lace out straight and lay between folds of towels. Then ring the towel until water is absorbed from the lace.

If starch is desired, use cold starch and a small quantity of bluing, if needed. Press between folds of new lawn. Coffee or tea water may be used to dip white lace in if a cream color is desired. Laces may be bleached by rubbing with lemon juice and salt, then exposed to the sunlight.

When laundering black lace, dip a piece of crepe into a vessel of water, then squeeze it together with the lace, until the lace is thoroughly damp and every part is gone over. To dry, stretch out on a board and pin out all the points.

CHEER UP.

It's the best advice for the woman to follow if she is sincere in her effort to lose years and gain dimples. There may be a sad, sullen, somber beauty, but it's not the kind worth working for nor the kind one wants to look at day in and day out, summer and winter, in sickness and in health, till the final parting.

The woman we love is the woman with the sunshiny heart. And she's the woman we think of when someone speaks about the various types of modern beauty. Perfect features, rose leaf complexions, may last for a time as the cover for a snarly nature. But when they vanish the unmasking is complete.

The free indulgence in emotions may be all very "temperamental." It may seem to be the hallmark of genius. It may distinguish you from your companions and make them treat you a bit different, catering to your whims, which is very flattering. But—it is the quickest and most complete way of destroying health, happiness and good looks that you can find.

One fit of anger means one year of age added to your life.

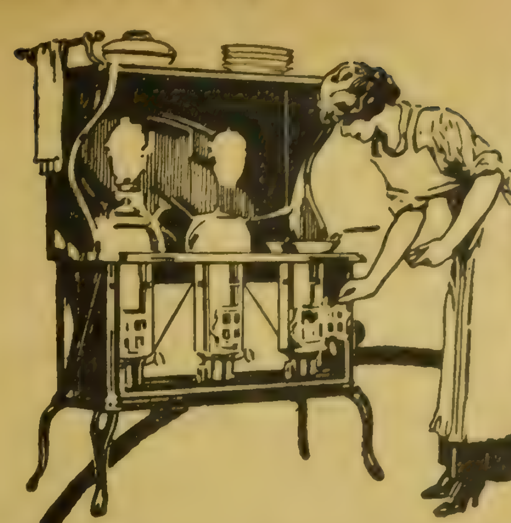
One hour of jealousy means one month of caring and massage and cold creaming before the marks are entirely gone.—Farm and Fireside.

PAPERING WHITEWASHED WALLS

Scrape off every particle of the old paper. Then wash the walls with a mixture of one pound of alum and two gallons of water. If this is thoroughly done, little difficulty should be experienced in making the paper stick. The walls should be allowed to dry before starting to hang the paper. It is best to make the paste the day before papering, so that it will be cold. The addition of glue will increase its adhesive qualities.

WORTH TRYING

A young lady took down the receiver and discovered that the telephone was in use. "I just put on a pan of beans for dinner," she heard one woman complacently informing another. She hung up the receiver and waited. Three times she waited, and then, exasperated, she broke into the conversation. "Madam, I smell your beans burning," she announced crisply. A horrified scream greeted the remark, and the young lady was able to put in her call.—Christian Endeavor World.



Ready
at the touch
of a match

With a good oil cook stove there's no delay or bother—no lugging of wood, coal or ashes. There's no smoke—no waiting for the fire to "catch up". Cooking starts at once and when you're through you simply turn off the heat—no fuel wasted. The

New Perfection
OIL COOK STOVE

is not just a "quick lunch", light housekeeping affair. It is a complete all 'round stove that you can bake, broil and roast on just as well as on a wood or coal range—and a lot cheaper. Best of all—it doesn't overheat the kitchen. An ideal summer stove. Doesn't smoke. Doesn't taint the food. Dealers everywhere.

HAY

Under date of July 18, Scott, Magner & Miller say:

Arrivals of hay during the week just past were 2769 tons, about the same quantity as has been coming in for the last few weeks. The consumers are buying very sparingly and only what they require for immediate use. The majority of wheat hay is coming from Contra Costa County. It is of a good grade of coarse, good colored hay, and has been selling here in San Francisco in carload lots from $10.00 to $11.00 per ton. The market on alfalfa is unchanged.

Citrus Fruit Market

LOS ANGELES, July 22, 1914.

Greatly reduced shipments enable the market to clean up holdover for several weeks, and a much firmer condition now prevails. Shipments, however, have been increased and are again back close to the 100 per day mark, and it is presumed that during the next week rather a weakened condition will return. The fruit is excellent and carrying exceptionally well.

There are 330,000 boxes of foreign lemons afloat. The average for five years at this date has been 172,000 boxes. This is causing a serious slump along all Atlantic coast points. California's are making no effort to go farther east than Chicago. The hot weather of the middle west has caused very heavy consumption, and all California offerings are quickly picked up and at satisfactory prices. The foreigns are proving poorer keepers and some sales have been made as low as $1.30.

Shipments.

Shipments of oranges to date from Southern California since November 1, 1913, 32,722 cars; lemons, 2,333; total, 35,055. To same date last season: oranges, 12,212 cars; lemons, 1,848; total, 14,060. Total of citrus fruits two years ago this date, 31,660. Tulare County shipments practically ended. Totals for year, together with those of Butte County, will be given later.

NEW YORK, July 20.—Twenty-six cars Valencias sold. Market is strong and higher on strictly fancy stock, lower in spots on other grades.

THE SUGAR BEET HARVEST

(Continued from Page 81.)

pious moisture to the plateau lands on which the best fields are.

There is doubt and speculation as to what the factories will do after this season. Will the beet sugar factories so favorably located as are those of Southern California continue to operate notwithstanding the free clause of the tariff act which becomes operative next year? In the face of the bright crop prospect this year, it would be hard to believe that such course is not to be.

SUPERIOR KNOWLEDGE

The priest had preached a fine sermon on "Married Life and Its Duties." Two old Irish women were heard coming out of church commenting on the address.

"It's a fine sermon his reverence would be after giving us," said one to the other.

"It is, indeed," was the quick reply, "and I wish I knew as little about the matter as he does."

MORNING MUSING

"Scrape! Scrape! Scrape!
Each morning I have to shave,
And then with a tonic to coax the hair
The top of my head I lave.
And this is the song I spin
While giving the blade a shove;
Why can't I be bald upon the chin
And have whiskers that grow above?
—Boston Globe.

WE ALL LIKE IT STILL

An "Old Oaken Bucket" sort of poet concludes a bit of verse "An' so I love the old piano still." We all like it still. People with old pianos should make a note of this.

BRUTE

"Do you like my complexion?" she asked.

"No," he replied absently, "rub it out and do it over."

Figg—Does your grocer sell his apples by the barrel?

Fogg—Well, they come in barrels, but what he sells them by is the top layer.

Marketing!!

That's the Problem

It matters little whether you have to sell a carload of cornfed steers, or a bushel of onions, the problem is before you. And you must meet it. Here's a concrete illustration:

Why Is It So?

"When the farmers of Kansas are feeding Elberta peaches to their swine, rather than to haul them to a 15-cent market, the housewives of Chicago and the great Northwest are paying one dollar a peck, $3.50 a bushel, for the fruit."—A news item.

This absorbing problem was threshed out to exhaustion in the Great National Conference on "MARKETING and FARM CREDITS," held in Chicago in 1913. The ablest men in the World participated in the deliberations and discussions.

232 Solid Pages

The report of this week's work, reduced to the very quintessence of Argument, Reason and Conclusion, makes a book of 232 pages of rare merit. It is full of the "why" of marketing, and it is put in very readable form—so plain that any one may read it for entertainment. Richly printed; cloth bound.

Only 1000 Copies

left, while there are 1,000,000 farmers and economists in this country who need and really want them. Price is just $1.00, postage included. During the month of July, 1914, these desirable books go onto the Bargain Counter to our subscribers. New subscribers or renewals are treated alike.

NAME	P. O. ADDRESS	STATE

Signed..

Address..

J. D. Clark, J. E. Benton, Charles Tolle, O. T. Gallatin, D. M. Kirkland and Mrs. Hilda Fleming of Holtville, Imperial Valley, who came to "look over" the lands of Milford Valley, Utah, July 4th. They bought from 40 to 160 acres each.

—they **CAME** from Holtville, Imperial Valley's richest section—they **SAW** with their own eyes the fertile-productive lands of Milford Valley—and every one of them **BOUGHT** from 40 to 160 acres on the spot.

Can you ask for a more smashing argument? Six experienced, successful, well-to-do ranchers from the richest district of Imperial Valley **buy 40 to 160 acres of Milford Valley lands on sight.**

These people made good in Imperial Valley—they made money. They know a good land buy when they see it. They are solid, practical, experienced. In judging land, they don't ask for opinions and promises—**they have to be shown.** When people of this type **buy**—they don't guess, they **know** what they're getting.

They had read the advertisements of the New Milford Valley irrigation project—they thought these ads were "just ads" and they took them "with a grain of salt"—but they decided to run up and look things over at any rate. Six firm signatures on six crisp checks was their endorsement.

$30 An Acre

Adjoining Live Town of Milford, Utah, on Main Line of Salt Lake Railroad

The soil in Milford Valley is rich and loamy—soil at $30 an acre that produces bigger and better alfalfa crops than Imperial Valley; brings $200 an acre from potatoes the first year (400 to 600 bushels is the usual yield, netting $200 to $300 per acre). This section is famous for its bumper crops of apples, plums, cherries, wheat, oats, celery, asparagus, sugar beets, onions and garden truck. Fortunes in dairying and hog raising.

Water should not cost more than 30 cents per acre per year—perpetual water right, $70 per share, 12 years' time to pay for it if you wish. Delicious, pure, soft drinking water. Exhilarating mountain air—elevation 4971 feet.

If you are in a position to demand the **best in the west**—Milford is your opportunity. This land should be worth close to $300 an acre or more when in alfalfa. Establish your son in Milford Valley. It will be the making of him. Write **today** for our illustrated booklet. Delay may mean disappointment to you.

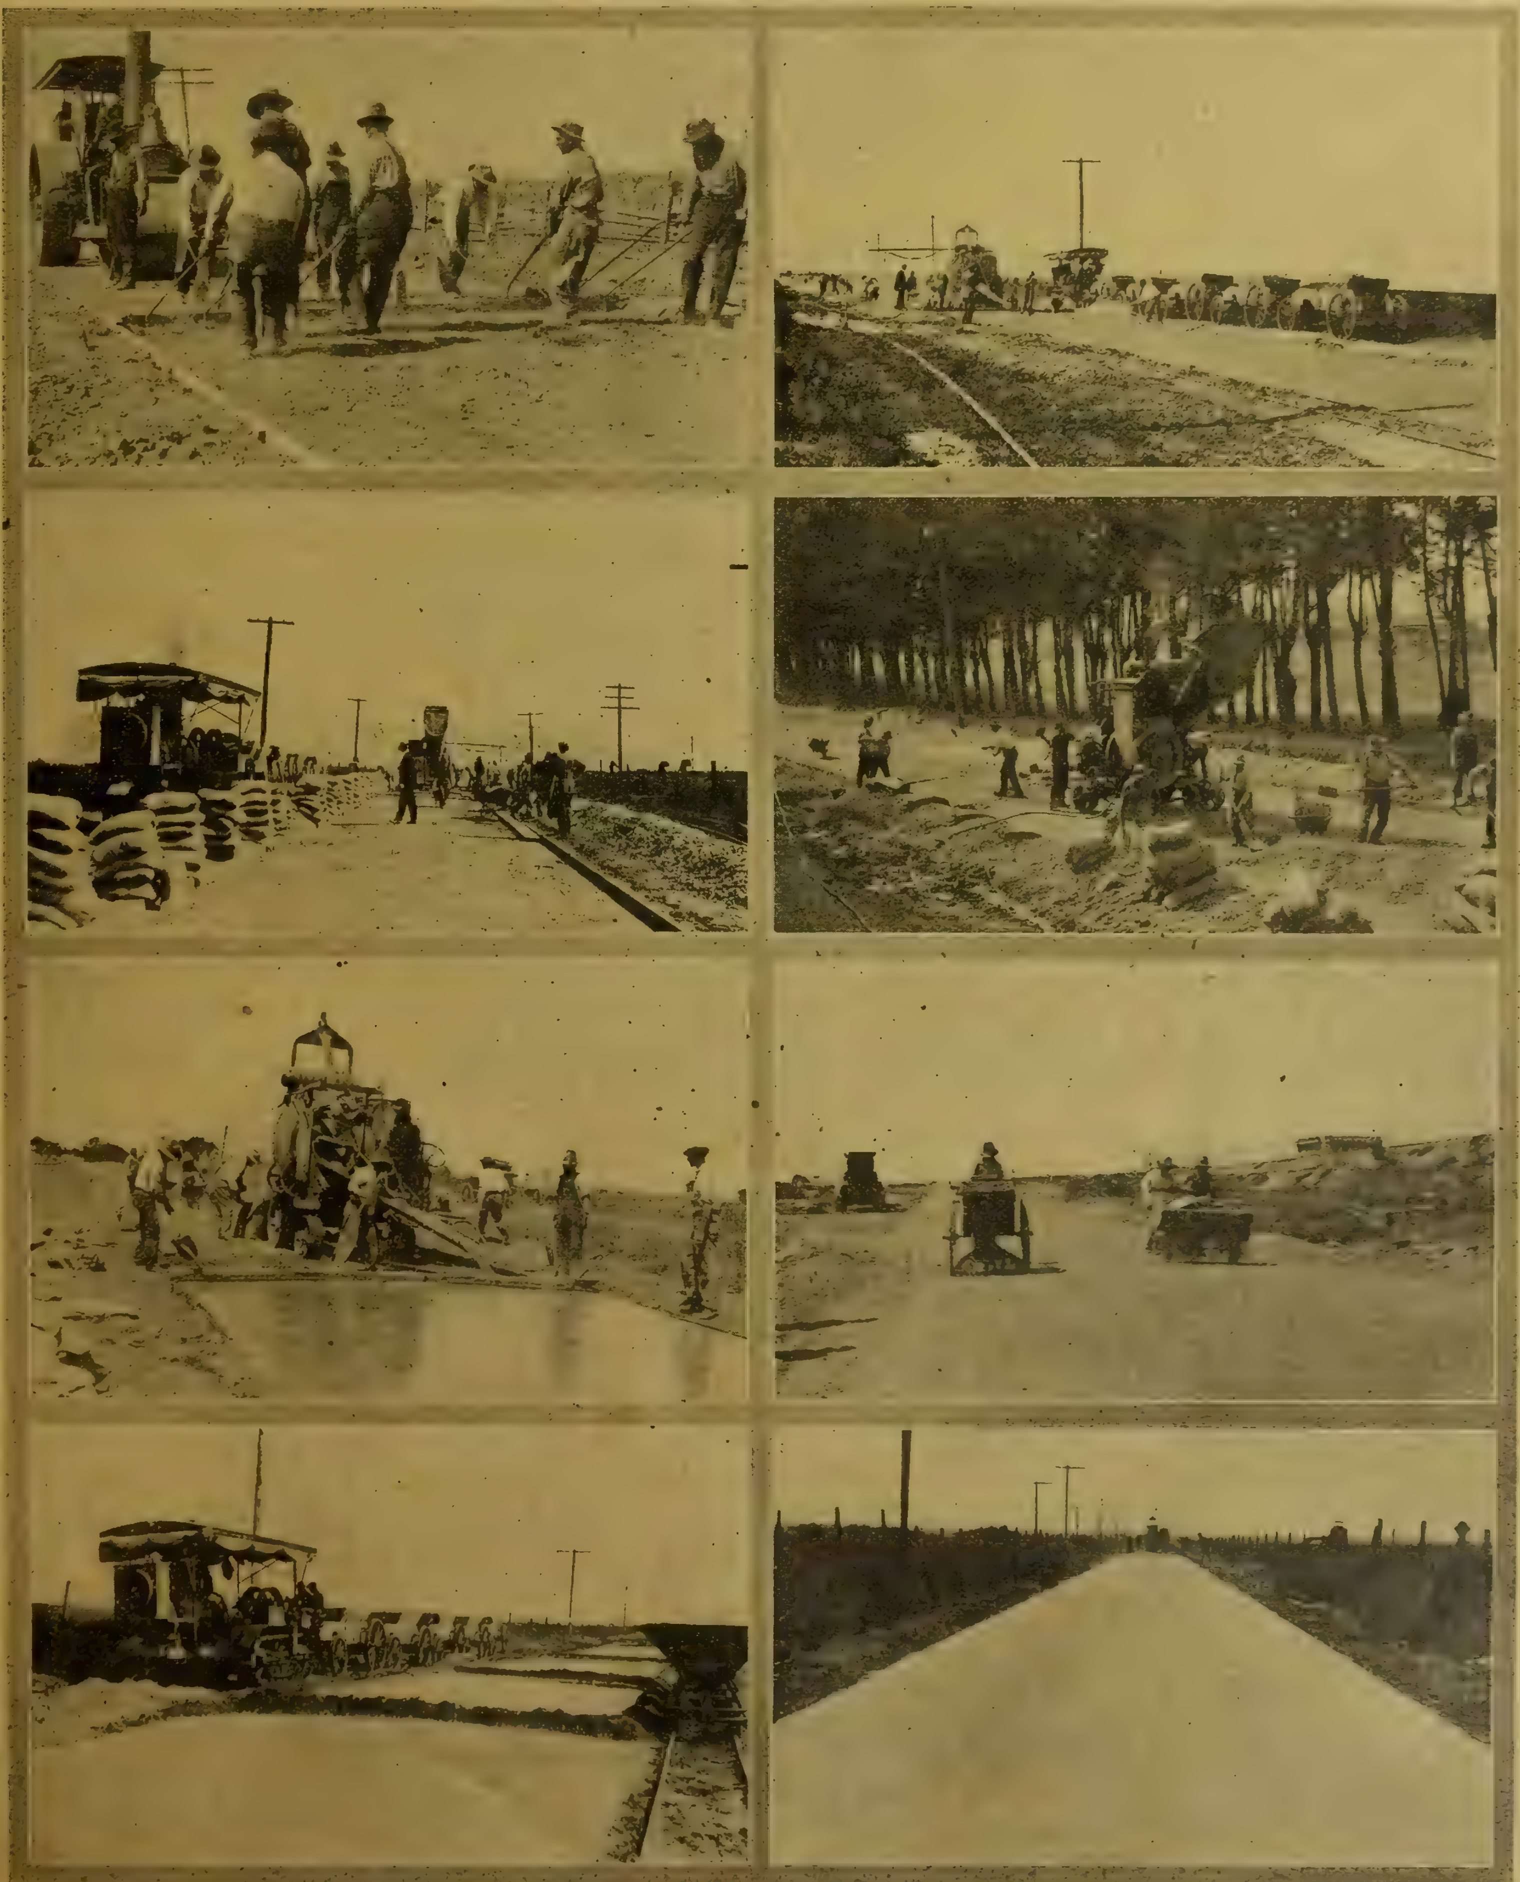
Improved Methods of Road Construction in California



CITRUS TREES FUMIGATED

with

HYDROCYANIC ACID GAS

produce

GOOD, CLEAN, SOUND FRUIT in much GREATER ABUNDANCE than do UNFUMIGATED TREES

Use

Improved Form
of
PURE (129%) SODIUM CYANIDE

It is in 1-oz. pieces.
It prevents waste.
It generates uniformly.
It saves money.
It is free from "Fines."
It is convenient to use.
It does clean work.
It saves time.

Because it generates evenly, little or no SULPHURIC ACID is carried out of the generator with the Hydrocyanic Acid Gas. Result—the practical elimination of burning and pitting of fruit.

The life of tents will be materially prolonged with the use of this material.

Practical field experiments have demonstrated its merits.

"Cyanegg" is the ideal material for use in the generation of Hydrocyanic Acid Gas, for fumigation operations.

F. W. BRAUN
Los Angeles
AGENT
THE ROESSLER & HASSLACHER CHEMICAL CO.

What a few prominently successful citrus fruit growers think of fumigation with hydrocyanic acid gas:

Mr. O. B. Griffin, assistant manager Leffingwell ranch, Whittier, Cal.:

"The fumigation of citrus trees is a profitable investment for the citrus fruit grower, and properly done will bring large returns."

Mr. McGill, manager McNally ranch, La Mirada:

"Correct and proper fumigation is the keystone in the structure of the citrus fruit industry. Without it there could be no profitable growing of citrus fruit."

Judge Erskine M. Ross, Los Angeles, Cal.:

"I have your letter of this date asking for a brief statement of my experience in respect to the advisability of fumigating citrus trees. As I have been a grower of such fruit for many years, I ought to know something not only of the advisability, but the absolute necessity of fumigation in localities where one's trees are subject to scale. I know from experience that a good crop of merchantable fruit cannot be produced on the same trees that produce a good crop of scale of any kind. I have, among other orchards, a good Valencia orchard of a fine quality of fruit. My failure to fumigate it three years ago caused me practically the loss of the crop of that orchard for two years; the income from which either year would have paid the cost of fumigation many times over. I did not fumigate it that year because those who examined it for the purpose, including myself, thought that it would go through that season without any substantial harm, without fumigation; but the scale multiplied so rapidly and so unexpectedly as to bring about the result above indicated."

Mr. Hemphill, manager for C. C. Chapman, Fullerton, Cal.:

"Correct fumigation spells clean trees, more and better fruit, highest prices in the market, and larger returns for the grower."

Mr. W. C. Hendricks, manager, Azusa Citrus Association, Azusa, Cal.:

"The cost of fumigating citrus trees should not be considered as a part of the expense account in the handling of a citrus grove, but rather as an investment that brings speedy and large returns on the money paid out."

Corona Lemon Co., Corona, Cal.:

"Replying to your inquiry, I did not suppose any California Citrus Grower in this day and age would doubt the absolute necessity of fumigation for scale. Any man who has scale and cannot fumigate should sell out as soon as possible, for there is no place for him in the business."

W. H. Jameson, Corona, Cal.:

"In reply to your favor of the 18th we have to say that we are strong believers in fumigation with Cyanide, as we consider it the most practical way to control the scale pest that has as yet been discovered.

"Whenever scale begins to make its appearance in orange or lemon trees here the grade of the fruit is lowered and if the scale is not cleaned up the trees begin to show the effects and the yield will surely be materially affected."

Mr. Pease, Horticultural Commissioner of San Bernardino, has knowledge of trees producing from four to six times more oranges and better fruit the first year following fumigation than they produced before fumigation.

Another Pest of the Citrus Industry

The "Gray" Scale is the Latest to be Added to our "Color Scale" of Pests of Orchard Trees. Tulare County Making a Strong Fight to Eradicate the Pest from Her Orchards

Every new fruit country has a material advantage over older producing sections in one point at least, and that is its immunity from insect pests. This immunity is temporary, and all fruit districts recognize this. Of course, for boosting purposes it is often said that "our section is permanently immune because of our climatic conditions," or this or the other "favorable circumstance," but sooner or later we all enter the fight, and every year shows an increase in the number of the fruit growers' enemies.

It was my privilege to see the beginning of what will be a great and I believe a successful fight against a comparatively new pest in the state. This time it is in Tulare County, a section remarkably favored and a section in which the fumigation tent is practically unknown. At first when the "False Brown" scale, the "Long" scale, the "Gray" scale, or, more correctly and scientifically, Coccus citricola, was disovered there was a slight disposition to convey the idea that it would not be able to live under Tulare County conditions, but now growers are looking squarely in the face of the fact that the pest is with them to stay. They frankly admit it, but add quickly, "We will clean up our orchards and show our ability to control the conditions." To that end County Horticultural Commissioner Charles P. Collins of Tulare has drawn upon one of the careful investigators of the southland, and Mr. R. P. Cundiff, formerly horticultural commissioner of Riverside County, has gone into the field to aid. In addition, a corps of energetic inspectors has been appointed. There are 11 of them and they have made inspection of the citrus orchards of the county. Before their search it was assumed there might be 700 or 800 acres of the lands of Tulare County infested. It is now stated that there are more than 15,000 acres infested, to a greater or less degree.

But what is Coccus citricola? It is not exactly like the Soft Brown scale, but near enough to it in appearance so that it was at one time thought to be a slightly different form of the soft scale. In the monthly bulletin of the state horticultural commission of August, 1913, Mr. Kell wrote:

Mr. Cundiff Showing to Commissioner Collins Twig of Orange Tree So Badly Infested That More Than Half of It Has Been Killed By Coccus Citricola.

"This scale is somewhat similar to the soft brown scale (Coccus hesperidum), but is grayer, less shiny and the young are more transparent and lie flatter to the leaf, appearing to adhere closely to it as a mere film. The ants do not foster it to the same extent as they do Coccus hesperidum.

"The scale is practically viviparous, though eggs can occasionally be found along with the live young under the old shells. The hatch appears to be fairly regular, extending from about May 1st to August 21st, in the two years I have had it under observation. Mr. Roy Campbell, who is working on the life history of this scale, tells me that he has counted as many as 500 young from one scale.

Discussing the Scale Situation on the Hills Above Lindsay

A Background Within the Sweep of the Eye of Perhaps 15,000 Acres of Citrus Orchards. Reading from Left to Right the Gentlemen are: R. P. Cundiff, Formerly of Riverside, Giving Expert Advice to Tulare County Horticultural Commissioner Collins (Center) and Inspector Hershey of the Lindsay District.

"The adult scales vary much in size, giving the appearance of an uneven hatch, but one finds the quite small ones bringing forth young at the same time as those that are perhaps six times their size. The biggest are larger than the largest soft brown scale.

"Soon after hatching begins the surface of the mother scales becomes dry and light brown in color and begins to adhere less closely to the twig. At this stage they are found almost wholly on the smaller twigs, being arranged in places in an imbricated manner, covering the twig like fish-scales. When the young are all out, the dead shells are very apt to drop off, leaving whitish marks. One does not find many old shells of the preceding year, as is the case with the black scale.

"This scale throws out a great deal of honeydew, the resulting smut making the trees very dirty, but this takes place somewhat later in the season than is the case with the black scale, so that the navel oranges have usually been picked, but the Valencias become much soiled."

Subsequent to this, however, the correct determination was made and the scale received its new name of Coccus citricola. Literature referring to this pest is extremely meager, and where it came from and when it came to California is entirely unknown.

Mr. Geo. P. Weldon, deputy state horticultural commissioner, writes: "Coccus citricola was described on page 222 of the May number of the Entomological News, by Roy E. Campbell of Berkeley. In his article he gives as the distribution of this pest: Pomona, Claremont, Ontario, Cucamonga, Colton, Highlands, Redlands and Riverside, in Southern California; Tulare and Fresno Counties in the lower San Joaquin Valley and slight infestations in Sacramento, Yuba City and Marysville of the Sacramento Valley. I might add to this list Martinez, as a very bad infestation was discovered there on some orange trees. As far as we know this pest has no other host plant besides the citrus trees."

A few months ago, or late in 1913, experiments in fumigation were tried in Tulare County. These showed indifferent success, many thought because the dosage was insufficient. This year the dosage will be materially increased and work is beginning much earlier. In fact, Mr. Collins has ordered for the county 160 tents. This will be sufficient for five outfits. Instead of using "¾A" schedule, chemists have figured a new schedule, copy of which is given on another page. This is 85 per cent of

Citrus and Tropical Fruits

EFFECTS OF FREEZING UPON CITRUS TREES AND FRUIT

By Carl Nichols.

Frost-Injured Leaves

A frozen leaf may be readily detected by the dark colored, moist appearance before thawing. If the leaf is only partly frozen, by glancing at the under side characteristic dark-colored areas appear, giving to the leaf a mottled appearance. After thawing the injured leaves will turn yellow and curl, appearing to suffer from a lack of water. If only slightly injured they may regain their normal condition and still remain on the tree. Whether such leaves will serve a useful purpose on the tree is doubtful; it appears that their usefulness is lessened for one season at least, and that their lives are possibly shortened.

In Florida after the severe freezes of the season 1894-95, the orange leaves which were severely injured did not fall immediately, but remained attached to the tree about nine days, at which time they were very crisp and dry. After this the dropping was gradual and was mainly caused by the wind. Lemons and citrons were the first to show evidence of the freeze, the leaves withering and turning brown in about two days. The upper leaves were usually the first to fall, while the lower ones frequently remained to some extent. Defoliated trees are in great danger of severe injury from a second cold wave.

Frost-Injured Twigs

The young tender growth may be injured to some extent by cold which is sufficiently intense to defoliate the tree and yet is not severe enough to injure the larger branches. Much depends on the degree of dormancy; twigs if sufficiently dormant will resist considerable cold. As a general rule the resistant power of the twigs also varies directly with the diameter, the smaller twigs being less resistant.

Frost-Injured Trunks

The trunk can stand more cold than any other part of the tree. If severely frozen, however, it is killed to the ground and may often be split open, if the cold is sufficiently intense. As with branches, its resistant power is in direct ratio to the diameter. Often after severe freezing the bark will split, but not the wood. During the freeze of January, 1913, in Southern California this often happened. In such cases it was found that the bark would curl either outward or inward upon drying, or in some cases it would stick tight to the wood. In cases where the loosened bark curls inward, the free portion should be at once removed or more and more of the bark will be loosened as drying continues.

In Florida it was found that the weakest part of the tree, or the part most susceptible to injury by cold, was the point of union between bud and stock. In that region it was found to be of great help to protect this union with a mound of earth. It was also found that a dense mass of foliage, especially on a low-headed tree, was of much importance in protecting the trunk from injury.

Frost-Injured Fruit

It is usually considered that the fruit of all varieties have about the same resistance to cold. When slightly frozen the fruit will have a characteristic dark mottled appearance. When severely frozen, if cut open, it will be found to contain a mass of ice crystals which may be scraped off the cut surface with a knife blade. Usually, inside the fruit in the membranes between the segments and in the membranes of the pulp vesicles, will be found small white crystals of hesperidin. Whenever found in the fruit it is satisfactory evidence that the fruit has been frozen. Upon thawing, the frosted portions of the rind appear light-colored. The rind in some cases is not sufficiently injured to show any change in color, yet its constitution may be changed so as to permit of evaporation of the juice in the pulp. Frozen fruits when thawed out quickly soon become soft and watery, hanging as flabby, misshapen masses upon the limbs. The juice after a time evaporates and nothing is left but a chaffy mass of juice sacks. On the surface the fruit may appear uninjured, yet when cut open the segments will be found to have shrunken, leaving wide spaces between; the fruit as a result becomes light in weight. Severely frozen fruit usually begins to drop in about 12 days, and often the surface of the ground is covered with such.

Frost-injured fruit is often found in which only scattering cells here and there are injured. With such fruit the uninjured cells will often swell and fill the places occupied by the damaged cells, thus resulting in a fruit which is just as good as though it had never been touched by frost.

It has been found that frost-injured fruit can be eaten with no fear of harm resulting. This matter was thoroughly studied by Dr. Webber after the great freeze in Florida. At that time frozen oranges and pomelos were eaten in great quantities and large shipments were made to the northern markets. So far as could be learned no injury whatever resulted from this unprecedented consumption, and any claims made that frozen fruit is unhealthful, are entirely unfounded.

Resistance to Frost

It is noticed that under certain conditions trees are more resistant to freezing than under others. In Florida it was found that trees affected by the white fly or by scale insects suffered to a much greater degree than those free from pests. The insects suck the sap and devitalize the tree, leaving it in a poor condition to withstand cold. The same holds true when the tree is diseased from any cause, whether the disease is due to some fungus organism or is the result of physiological trouble.

The condition of trees which lack a proper food supply is in many ways similar to those which are suffering from disease. Trees which are in healthy, vigorous condition and have well developed, dark green foliage, are much better able to resist cold temperatures. But one should be very careful not to overstimulate the trees, as then the trees would produce a large amount of sappy, immature wood which would be very susceptible to injury. This applies especially to

nitrogenous fertilizers which when applied in large quantities are almost certain to produce excessive woody growth Nevertheless one should see that the soil contains an adequate amount of the fertilizing element.

Much has been said about the use of potash fertilizers as a protection against frost. It appears that liberal amounts of potash have a decided effect on hardening and maturing new growth, and various observations are reported which show that crops and fruits fertilized with potash salts are more resistant to frost than ones not so treated. In one test two varieties of grapes were grown in a series of fertilizer plats, part being supplied with potash salts and the rest having no additional potash applied. During severe frosts those growing in plats which were fertilized with the potash were much less injured. Analyses showed that these shoots had a lower water content and a higher percentage of dry matter and ash than shoots from unfertilized vines. The higher resistance where potash is supplied is thought to be due to a greater concentration of the cell sap.

Similar results have apparently obtained with sodium nitrate as the fertilizer. But as noted above great care must be used not to supply an excess of this substance or of any other nitrogenous fertilizer.

The degree of dormancy is one of the most important factors relating to the resistance of citrus trees to frost. Citrus trees are not distincly periodic in growh. They respond readily to short periods of warm weather which cause the sap to commence to flow and the buds to swell. In this condition they may be severely injured by temperatures but little below the freezing point. When perfectly dormant the trees will stand a considerable degree of cold. For instance, in the citrus regions of the great central valleys, especially in the northern citrus regions of California, the trees are in such a dormant condition during the winter that they are seldom if ever severely injured by the lowest temperatures which have been known to occur. Again in Italy, citrus tres, because of their dormant condition, are fairly resistant to cold, provided the temperature falls only a few degrees below freezing, and for this reason Italian citrus growers take no measures to protect their trees, except on a small scale by covering with mats, etc. Going from Rome toward the north, citrus trees are not infrequently seen covered with snow for some hours, or even a few days; yet they suffer no injury, except in the case of Mandarins, which are the least resistant varieties. On the 18th of February, 1913, a heavy snow fell in Rome and in many other parts of Italy, with but little damage reported to citrus trees or fruits.

RELATIVE IMPORTANCE OF FRUIT CROPS

Following is a review of interesting facts gleaned from the last U. S. Census by Mr. C. S. Milliken. It was given before the recent meeting at the Citrus Experiment Station at Riverside of an informal association of all the men working upon the problems of scientific agriculture in Southern California, employed by the federal department of agriculture, the University of California and the state commision of horticulture. Once a month the members meet to discuss the work in their respective fields and current literature bearing upon agriculture and the allied sciences.

The Relative Importance of Fruit Crops.

A little browsing in the thirteenth census of the United States reveals some facts regarding the fruit crops of California, especially her citrus crop, which may be of general interest.

The following table shows the relative value of the principal crops of the United States in 1909; the citrus crop ranking 14:

Table No. 1

Value of crops if the United States, 1909:

1.	Corn	$1,438,553,919
2.	Cotton and cottonseed	824,696 287
3.	Hay and forage	824,004,877
4.	Wheat	657,656,801
5.	Oats	414,697,422
6.	Potatoes	166,423,910
7.	Tobacco	104,302,856
8.	Barley	92,458,571
9.	Apples	83,231,492
10.	Sweet potatoes and yams	35,429,176
11.	Flaxseed	28,907,554
12.	Peaches and nectarines	28,781,078
13.	Sugar cane	26,415,952
14.	Citrus	22,620.812
15.	Grapes	22,027,961
16.	Edible beans	21,771,482
17.	Rye	20,421,812
18.	Sugar beets	19,880,724
19.	Peanuts	18,271,929
20.	Strawberries	17,913.926
21.	Rough rice	16,019,607
22.	Dry peas	10,963,739
23.	Sorghum cane	10,174,457
24.	Plums and prunes	10,299,495

In table No. 2 are given the values of the principal nut and fruit crops of the United States in 1909. Apples easily take the lead here, while six fruits show crops valued at over ten million dollars.

Lubrication Logic

Your motor car needs just two things—reasonable attention and Zerolene.

ZERORENE
The Standard Oil for Motor Cars

Zerolene is the best motor oil the Standard Oil Company can make. It keeps the motor cool so the engine can do its work efficiently.

12.	Apricots	2,884,119
13.	Walnuts (English)	2,297,336
14.	Pomelos	2,060,610

An interesting table showing the leading two states in the production of the fruit and nut crops of table No. 2 is given in the following table. It will be seen that in the production of the most important 14 nut and fruit crops of the United States, California takes the lead over all other states with nine of these and is second with two others.

Table No. 3

Leading states in the production of the nut and fruit crop, 1909:

1. Apples:		Bushels
New York	$13,343,000—	25,409,324
Michigan	5,969,000—	12,332,296
2. Peaches and nectarines:		
California	$ 4,573,775—	9,267,118
Georgia	2,182,613—	2,555,499
3. Grapes:		Pounds
California	$10,847,000—	1,979,687,000
New York	3,962,000—	253,006,000
4 Strawberries:		
New York	$ 1,187,410	....
California	1,149,475	....
5. Oranges:		Boxes
California	$12,951,505—	14,436,000
Florida	4,304,987—	4,852,967
6. Plums and prunes:		Bushels
California	$ 5,473,539—	9,318,000
Oregon	838,783—	1,748,000
7. Pears:		
California	$ 1,660,963—	1,928,000
New York	1,418,218—	1,343,000
8. Cherries:		
California	$ 951,624—	501,000
Pennsylv'ia	909,975—	475,000
9. Raspberries and loganberries:		Quarts
New York	$ 1,168,062—	14,751,940
Michigan	695,019—	8,381,943
10. Blackberries and dewberries:		
Missouri	$ 456,283	....
New Jersey	313,480	....
11. Lemons:		Boxes
California	$ 2,976,571—	2,756,221
12. Apricots:		Bushels
California	$ 2,768,921—	4,066,823
Washington	17,280—	10,789
13. Walnuts:		Pounds
California	$ 2,247,193—	21,432,000
14. Pomelos:		Boxes
Florida	$ 1,907,816—	1,061,537
California	143,180—	122,515

With such a record it might be expected that the fruit and nut crop of California is its most important crop.

Table No. 4—California Crops 1909.

1.	Fruits and nuts	$50,707,000
2.	Hay and forage	42,187,000
3.	Cereals	28,040,000

The relative importance of the varieties of fruits helping to produce this fifty million revenue is shown in the following table:

Table No. 5—Nut and Fruit Crop of California, 1909.

1.	Oranges	$12,952,000
2.	Plums and prunes	5,632,000
3.	Peaches and nectarines	4,574,000
4.	Lemons	2,977,000
5.	Apples	2,902,000
6.	Apricots	2,769,000
7.	Walnuts	2,247,000
8.	Pears	1,928,000
9.	Almonds	700,000
10.	Olives	401,000
11	Figs	260,000
12.	Pomelos	143,000

Deciduous Fruit Culture

SUMMER IRRIGATION OF DECIDUOUS TREES

Written for the California Cultivator
By J. W. Mills.

Young Trees

It is advocated by some growers and professional men that young deciduous orchards should be given no water the first few years after planting. The reason given is that the root system is inclined to be drawn near to the surface when summer irrigation is practiced. We are rather skeptical about that, in as much as we have never known of comparative examinations having been made of root systems of irrigated and non-irrigated deciduous trees. We do know that one and two year old peach trees in adjoining orchards, with only a road between them, one irrigated and the other not, show a remarkable difference in favor of the irrigated trees. We also had a good object lesson with Bartlett pear trees where the main orchard received but two irrigations during the summer, followed by intensive cultivation. An irrigation ditch broke and flooded a few trees in one corner several times, thus giving them that many more irrigations. There was more than four times the growth on the flooded trees that there was on those irrigated but twice. On a certain ranch in the Sacramento Valley there were two peach orchards planted on a creek bottom soil, composed of a black silty loam. One orchard was irrigated in June following planting and again about August. The other was irrigated but once and in the latter part of the summer.

At pruning time the following winter we cut off branches, sometimes two or three to a tree, from the twice-irrigated trees, that were as large as any of the entire trees in the late irrigated orchards. Both orchards were Elberta peach. In this case we are of the same mind as the late C. E. Rumsey, when he was criticized for fertilizing and irrigating his young citrus orchard more than had ever been done in his vicinity. He said he did "not know what the roots were doing, but the tops were doing a first-class business." And they continued to do so for years and are yet so far as we know.

There may be many examples of young deciduous trees being started wrong by early irrigation, but we do not know of them. From our experience with citrus trees it is our opinion that the roots of deciduous trees will distribute themselves along the lines of least resistance. If plenty of water is soaked into the ground to a depth of several feet, theoretically the roots will take their natural course when they do not have to come up to secure the required moisture.

In the case of citrus trees we know that the feeding roots will come to within 10 to 15 inches of the surface under any circumstances. We had occasion to make root investigations of citrus trees at one time and found where 16-year-old and 30-year-old orange trees were pulled out by the roots that the distribution of the roots was the same in both cases, though the older trees had always had an abundance of water and the

200,000 FEET

All Sizes—Immediate Delivery.

Just received several carloads new and second-hand Water Pipe, Oil Well and Water Casing. Water pipe (per foot), ½-inch, 2½c; ¾-inch, 3c; 1-inch, 4c; 1¼-inch, 5c; 1½-inch, 6c; 2-inch, 7c; 3-inch, 15c. O. D. Casing (per foot), 2-inch, 6c; 3-inch, 12c; 3½-inch, 15c; 4-inch, 17c. Riveted pipe (per foot), 4-inch, 12c; 10-inch, 30c—also surface irrigation pipe. Many other sizes to select from. Prompt shipment. Write, wire or phone. Adams Pipe Works, 2030 Bay St., Los Angeles, Cal. Phones: Broadway 1264—F1917. (Under entirely new management.)

others had always been short of water.

While awaiting actual demonstrations that irrigating young deciduous trees has a bad effect, and seeing the marked improvement in irrigated trees, we are inclined to advocate such treatment.

Bearing Trees

There is no question that irrigating bearing trees is profitable. It takes a great deal of moisture to make first-class fruit, and if it is not in the soil for the roots to get, it should be put there.

Avoid late irrigation, as it makes soft fruit that is low in sugar. The period of lateness is hard to determine in any variety, but taking as a basis for consideration a peach orchard that produces ideal fruit without irrigation: Such trees must be on land that furnishes a full and constant supply of moisture from below by capillary action. Moisture will not rise over four feet in ordinary soil. Deciduous tree roots go deep we know. Six to 10 feet is perhaps as deep as they go, but in all probability the bulk of the feeding roots are within three feet of the surface. If this is probable, which it is (by figuring that a foot of water in an old orchard greatly invigorates the trees, also knowing that a foot of water will not wet average soils over three or four feet deep), the water supply must be within eight or 10 feet from the surface. In such an orchard the trees and fruit are at all times drawing a steady supply of moisture and their development is gradual with no interruptions and perhaps of a little longer duration than in drier situations.

Now where trees are a little "short" and then a little "long" on moisture, the development is spasmodic and interrupted. If at the final period the flow of sap is stimulated, its elaboration, the process of sugar development, is rushed, and at the same time the process of exosmosis seems to dilute the sugar in the fruit. It is evident that in the case of land that requires irrigation, the largest possible quantity of water should be placed at a depth of four to six or eight feet at a time before the sugar-forming process commences. Who knows just when that occurs? That is a good problem for the experiment stations to solve.

Could we give the last irrigation at this unknown period, sufficient to soak down six or eight feet, no doubt we would secure large, firm fruit rich in sugar. It is our opinion that in the case of peaches the last irrigation should be when the fruit is hard green and about half grown. With prunes it will no doubt impair the quality if irrigated after the fruit becomes palatable. We had occasion to observe this in a Tehama County prune orchard. The fruit dried light and was rated as skinny by the buyer.

Some soils require more frequent irrigation than others and every fruit grower should determine what the character of the soil is five or six feet below the surface. A gravelly subsoil will require less water at a time, but more frequent irrigations.

Soils that crack after irrigation should not be cultivated at once, but allowed to crack, then irrigated again. This process repeated twice, giving three irrigations in succession, will put the water deeper into the soil than one thorough irrigation in the old way.

Just how long water should run in a furrow in order to soak down six feet must be determined by the irrigator, as the character of the soil determines that. Without a pipe system with adjustable valves, it is hard to obtain an even flow in furrows such as is necessary in order to get the water to a proper depth.

Pruning After Irrigation

Apricots and cherries are frequently pruned after the fruit is picked. It seems to improve the fruit buds for the following year. It is also a convenient time to do the work, as the fruit is off early and a slack time follows the harvest. Peach trees do not take kindly to summer pruning. Prunes are so late in harvesting that there is no advantage in late fall pruning.

Young trees should never be pruned in the summer, that is, before the bearing age, other than the removal of sprouts very low down on the stem that is to make the trunk. Every time a shoot is pinched off the growth is stopped at the time when it should be making its most rapid growth.

THE CALIFORNIA WALNUT GROWERS' ASSOCIATION

By C. Thorpe, Manager of the Association, Before State Fruit Growers at Davis.

In order to make any intelligent remarks regarding our organization it is necesary to first outline briefly the steps leading up to its formation. Years ago when the walnut industry was in its infancy in California there was no semblance of a steady price on walnuts, the price fluctuating from four to eight cents a pound to the grower, who was naturally at the mercy of the speculative buyer; conditions were then much as I understand they are now in the peach and apricot industry in California; the prices would often vary 50 per cent in a week or two. The average price to the grower was little, if any, above the cost of production, and not uncommonly the return was below cost.

At that time California walnuts were not favorably known to the trade of this country for the reason that there was no uniformity in grading, bleaching or packing methods, and consequently most of the crop went to the consumer in a very unattractive form.

It finally became apparent that some semblance of uniformity in packing and marketing methods was necessary if the industry was to develop and prosper. Thus growers in certain communities joined together and organized local cooperative associations and erected packing houses situated at near-by railroad shipping points where all members could conveniently haul their crop for grading, bleaching, packing and shipping, and more or less uniform rules for grading and marketing the product were soon developed.

During this stage each local association would, early in the harvesting season, call for bids on its entire output and sell to the highest bidder. This method of bunching the sale of the crop of a number of growers, together with better packing methods, soon brought more satisfactory and

(Continued on Page 105)

The only practical feed that meets fully the vital necessity for bulk, palatability and succulence.

YOU have only to watch your cattle eat Larrowe's Dried Beet Pulp just once to appreciate how palatable it is. They take it ravenously. They like it because it is a natural vegetable food. Even while in the pasture they will eat it with great relish, and when deprived of green food do not suffer in health or fall off in milk production if a suitable proportion is included in their ration.

Larrowe's Dried Beet Pulp is as digestible as it is palatable. It also makes digestible the entire ration in which it is included, because it makes the whole loose and bulky. This one fact explains the reason why, while rations can be made up of various feeds so that they will contain equal nutriment, judging by analysis, the Dried Beet Pulp cannot be omitted from any ration without a distinct loss that affects both the health of the cow and the amount of her milk. A light, loose food in the cow's stomach is open to the action of the gastric juices, while a solidly massed food repels them and makes digestion difficult. Larrowe's Dried Beet Pulp swells from 5 to 6 times its bulk when moistened. It is practically the only feed which does not become a solidly packed mass.

PROVE ITS VALUE WITH ONE SACK

Go to your feed dealer today and get one 100-pound sack and test it on one cow whose milk record you know. You'll get instant results—1 to 5 pounds more milk per day from each cow.

Be sure you get "Larrowe's." It is never blackened or burned. Always uniform. Keeps indefinitely.

READ THESE CONVINCING LETTERS.

From Mr. C. A. Puffer, Prop. El Casco Dairy Ranch, El Casco, Cal.

"We heartily recommend Larrowe's Dried Beet Pulp as a milk producer and a feed that keeps the cows in good condition. We use our feed four parts beet pulp to one part bran, and feed it wet. During the winter season we feed from three to eight pounds (dry weight), according to the amount of milk the cow gives.

"When the cattle are on good grass, we feed three pounds of pulp per cow, and consider that we get good returns for money so spent. We prefer your beet pulp because of its uniform condition and freedom from dirt and disagreeable odors. It gives us pleasure to express our appreciation of the prompt attention and courtesy we have received from you.

"(Signed) C. A. PUFFER.

"P. S.—We have also gotten good results from feeding beet pulp to calves that are from four to six months old."

From McAlister & Son, breeders of Pure Bred Holstein-Friesian Cattle.

"As a user of Larrowe's Dried Beet Pulp, it gives me pleasure to be able to recommend it to dairymen of California as an economical milk-producing feed. I consider that there is no concentrate that will take its place and give succulence to a ration like Larrowe's Dried Beet Pulp.

"I have used it continuously for the past three years, and fed it during some official tests which I made with some of my registered Holstein-Friesian cows, the results being most satisfactory. One heifer with her first calf milked over 65 pounds a day on this feed. The cows not only give an increased flow of milk while on beet pulp, but also keep up in flesh and are enabled to retain their healthy and vigorous condition.

"(Signed) JAMES W. McALISTER, JR."

LARROWE'S
MOLASSES-DRIED BEET PULP

is preferred by many feeders on account of its sweetness. Just the plain beet pulp with beet molasses dried. Fine for fattening; also for horses, hogs, etc. It is put up the same way as the plain and sold on the same basis. Ask your dealer for it.

The Ornamental Garden

TREE PLANTING IN SOUTHERN CALIFORNIA.

By W. Mervyn Carne.

(An Australian visitor to Southern California writing in the Agricultural Gazette of New South Wales gives descriptions of California streets and gardens and suggests lessons to dwellers in southeastern Australia.)

Southern California is a very large place, with perhaps as widely diverse conditions as may be found everywhere. But to Americans in general Southern California means those once barren valleys now known for their wealth and beauty throughout the world. To the Australian scenting home amidst the ever present gums come thoughts of the future. Surely we in Australia with natural advantages so similar to California can do as much for our land as the Americans have done for theirs. Redlands, Riverside and many another city have solved the old argument of city vs. country by being so much of both that one cannot say where one ends and the other begins. Small areas, intense cultivation and civic pride have made this beautiful country. It is "up to" Australia to do likewise. Much of the charm of the cities (all are not beautiful) lies in their trees. Almost to a tree they have been planted by hand, for except on the mountain ridges Southern California is practically treeless. Many kinds of trees are found in parks and gardens, but the following predominate and will probably prove the most useful in southeastern Australia. One of the most common is the pepper tree (Schinus molle), whose hardiness and rapidity of growth is proverbial and needs no emphasizing. Eucalypts of many species are used, but the bluegum (E. globulus) predominates. It is planted in avenues as breakwinds and in groves for timber and firewood. In avenues eucalypts are usually topped about six feet from the ground and send up three to six stems above that point. For firewood they are cut down and suckers allowed to shoot from the butt, three or four to each tree. The trees are cut over in rotation every four to seven years.

Silky oak (Grevillea robusta) is largely used in streets. The kurrajong, often miscalled bottle tree, and the camphor laurel give a pretty effect with their lighter greens and are often alternated. The former does not appear to produce seed in quantity, though Australian trees are usually very prolific in America. Pines are not largely used, though not uncommon, and include the Bunya Bunya and the Moreton Bay pines as well as Pinus radicata, the common pine about Sydney suburban streets. The most popular street tree is one not seen in Sydney yet well worthy of trial, though it grows wild from Tasmania to Queensland. That is the Blackwood (Acacia melanoxylon), one of the largest of our wattles and a valuable timber tree. It is used in great numbers, forming shapely, clean, dark green trees up to about 50 feet. It seems very free from the troubles, insect and fungous, which frequently bring about the premature death of acacias in Australia. Last and perhaps most striking of all are the palms. The majority belong either to genus Phoenix or to Washingtonia. The Phoenix palms are relatives of the date palm, itself sometimes used. Being relatively slow growing they are not so widely used as the Washingtonias. Until a few years ago the latter palms were known as Washingtonia robusta. It has been found that there are at least three distinct species, the best and hardiest being W. filifera. Another species, W. gracilis, is sold by seedsmen as W. robusta. Another smaller palm, Washingtonia sonorae, is also used, and a glaucous colored species called Erythea armata. Magnolias are not uncommon.

In Arizona few evergreen trees will survive the combined effects of frost and great heat even under irrigation and the favorite tree is the umbrella tree (Melia azedarach), better known to us as the white cedar or bead tree. It is usually topped to encourage the umbrella habit. The famous Magnolia Avenue at Riverside consists of three rows of trees—peppers, bluegums and an alternating row of silky oaks and Washingtonias. These with the blackwood in the streets form the bulk of the tree plantings in Southern California and serve as a striking object lesson of what can be accomplished among apparently unfavorable surroundings.

NOTES ON IRISES.

Spanish Irises.

These bulbous Irises are among the most attractive of the family, having numerous flowers with bright colors. They are hardy in a not too wet position; a satisfactory one being the second line under the south side of the house, where the first line is preferably vines, the foliage of which will serve as a background and foil to the Iris flowers. My bulbs seem to be too close to the house, especially in a season when exceptional dryness has rather shortened the blooming season.

The bulbous and Oncocyclus Irises are the most interesting of the family, and among the most interesting plants of any family. Those who grow a selection of these, however, give hostages to care, as many of them are decidedly miffy, and unless they have a suitable location, they live but decline to bloom, and the worst of it is that a location which pleases one year seems to lose its charm the next. Take as a familiar example of the Oncocyclus section, I. Susiana. This is a plant familiar to gardens for several hundred years, and probably every year it has been discussed by the gardeners, the most skillful ones of this generation still continuing the annual discussion. There seems to be a concensus of opinion that the proper culture consists in planting late in a sheltered position and drying off thoroughly after blooming. With all such care, however, it will be frequently found that some slight thing, like dryness, will cause them to go blind or refuse to flower It is a curious commentary on garden skill that one finds this iris blooming annually in gardens where no care is given to it, the owner, happily oblivious usually to the interest of the plant.

Thanks mostly to Herr Max Leichtlin, our gardens have been enriched by a number of interesting Oncocyclus irises—Lupina, Gatesii, Paradoxa and others of their kin, such as Leichtlinii and Korolkowi. These, with the old I. Iberica, are an interesting and beautiful lot for those who enjoy fine plants which are interesting in care and beauty.

Iris Pallida Dalmatica.

The great Dalmatian flag is one of the most attractive and among the largest of the family. It has broad, noble foliage, and the large flowers are of a pleasing light lavender with an orange beard. They are freely produced on stocky erect stems, without laterals, some three to four feet tall. The plant in bloom has an appearance of distinction and beauty and is worthy a prominent place in the garden. A delicate odor adds the last charm to this variety.

Iris Monnieri is a beardless iris with fragrant clustered flowers which are light lemon-yellow. The plant is attractive but not showy, except as grown in masses.—Exchange.

SHARPENING LAWN MOWERS

It is a general practice when a lawn mower becomes dull to take it to a shop to have it sharpened. At the shop there are two methods employed. One is to use a file on the reel and blade. This is a very poor way, as only experts with the file can produce a good job. More often the blades are uneven, being too high in places and too low in others. The result is the blades on the reel do not touch the lower plate or blade the same throughout their length, causing the mower to run hard and cutting the lawn unevenly.

The second method is to grind the blades of the reel in a special machine designed for that purpose. This is a much better way than the first method, as it leaves the blades quite true. But this method does not give the result required, as the lower plate or blade is not touched in the process of grinding. To put the mower in the best condition both the blades of the reel and the lower or fixed blade require sharpening.

A lawn mower may be sharpened at home at a very small expense and in such a manner that the objections alluded to above are entirely eliminated. Reverse the driving wheels on the mower, thereby driving the reel backward. Set up the lower blade until the reel touches it. Feed in between the reel blades and the lower, fixed blade, emery or carborundum mixed with oil to the consistency of thick paste. Run the mower over the lawn. This will grind the reel blades and the fixed blades at the same time. Both blades are made true with each other, and the mower will run as nicely and do as good work as when new. There is no danger of spoiling the machine by sharpening it in this manner.

Tubes of paste consisting of carborundum and grease are on the market for this purpose. A 25-cent tube of this paste will sharpen a lawn mower for a whole summer, and only a few minutes every two or three weeks will serve to keep the machine in first-class condition.—L. D. Crain, Colorado Agricultural College.

The greatest tulip exhibit ever possible anywhere outside Holland, will be a part of the national exhibit of The Netherlands at the Panama-Pacific International Exposition at San Francisco in 1915. Two acres will be devoted to beds of these gorgeous flowers.

Spineless Cactus HAVE YOU SEEN IT GROW? HAVE YOU SEEN IT FED?

One dairyman near Los Angeles produced over 40 tons off one acre first year. Owing to demand for plants he can sell them for a handsome profit. Will you be the first to demonstrate its growth and value in your community?

For further particulars concerning genuine Burbank varieties address Wm. W. Shigley, Suite 228-9, 702 So. Spring St., Los Angeles, Cal.

WALNUT GROWERS' ASSOCIATION

(Continued from Page 103)

uniform results to the grower. But still there remained a big element of speculation in the marketing.

As the local associations became more numerous and the industry developed larger proportions, the growers concluded that it would be possible for them to gather for themselves such statistics relative to the extent of the walnut production, both here and abroad, and the demand for their product in the country's markets, as would warrant them establishing their own prices, and instead of selling their entire holdings to the local speculative buyers, they decided to engage local brokers to make the sales throughout the United States for them, paying for such services about six per cent brokerage.

This latter marketing plan soon proved its superiority over the other methods, and as a consequence more walnut associations sprang into existence in other districts, till the necessity for a closer union throughout the industry became apparent. Thus a body known as "the executive committee of the Walnut Growers' Associations of Southern California" was formed. While this committee had no legal standing it proved to be of considerable benefit. Each local association was a member of the executive committee and could send as many delegates to the meetings as desired, but the voting power was determined on a tonnage basis. This executive committee handled the large general problems that developed as the walnut industry became more important; it also called for bids and purchased the bags and other supplies required by its members; it secured the information necessary for the establishing of sensible prices, and just before the shipping season the committee would meet and disburse this information to its members, who would then discuss the price which, in their judgment, the associations would be warranted in asking for their product.

There could be no agreement between the different associations in the establishment of a uniform price and as the opinions of the associations differed widely, sometimes resulting in different prices being asked, thereby developing such keen competition with each other that the market was often demoralized to such an extent that the jobber became disgusted and refused to buy at any price. It is common knowledge that the trade of this country buys but sparingly on a declining market. The result was that associations frequently had to carry over a portion of their crop, a bad condition, especially as walnuts should be shipped in time to reach the market for the holiday trade, the big demand for the product developing around Thanksgiving and Christmas.

It finally became apparent that in order to promptly market the constantly increasing California walnut crop and protect the producer and jobber against spasmodic market demoralization and stagnation, a guarantee of prices against decline was necessary. To make such guarantee effective it must be backed by a strong organization; an organization which was fairly representative of the industry. It was pointed out that if a satisfactory guarantee could be given the trade they would be willing to purchase their season's requirements of walnuts at one time, and confidence in the business would be stimulated.

Consequently the California Walnut Growers' Association was organized by a number of representative individual walnut growers, as a cooperative, non-profit marketing organization without capital stock.

Fifteen of the local walnut growers' associations immediately contracted with the California Walnut Growers' Association for the marketing of their output, and subsequently other associations did likewise, until at present the California Walnut Growers' Association is handling the marketing of 17 local associations out of the 20 walnut growers' associations in California, and is marketing about 65 to 70 per cent of the total walnut crop of this state.

Each local association is entitled to one representative as member of the central association, but the voting power of members is unequal, each member having one vote for each 100 tons, or major portion thereof, which the association he represents ships annually. The members have regular meetings four times a year, at which meetings the general policies of the association are discussed, and to these meetings the local associations are invited to send up to five delegates, although only the one who is a member of the central association may actually vote. There are 16 directors of the California Walnut Growers' Association, every important walnut producing district being represented on the board. Directors' meetings are held monthly.

For the first two years of its organization the California Walnut Growers' Association continued to market its output through coast brokerage houses, paying a brokerage of five and one-half to six per cent—almost one cent a pound—but while this system seemed the most practical while each local association had to market its own relatively small output, it became apparent that with the immense tonnage the central association controlled through its marketing contracts with the 17 local associations, that it would be much more economical to establish our own marketing organization. Thus our sales department was established early in January of this year. We have been successful in finding a market for our entire estimated output of the 1914 crop and have been refusing all business offered us since May 2nd. It is estimated that we will save the local associations, for which we market, over $50,000 annually by this change in our marketing system.

Since the organization of the California Walnut Growers' Association, less than three years ago, we have inaugurated a number of important changes in the walnut industry, amongst which are the installation of a statistical department through which we gather valuable information relative to the size, quality, time of shipment, markets, etc., of foreign walnut crops; maintaining salaried agents in the principal foreign producing districts. The information we thus gather is invaluable to us in the establishment of a proper price which will move our crop in competition with the imported walnuts. We have adopted systematic methods of distributing the product throughout the country's markets, eliminating the old unavoidable practice, while marketing through the large coast brokers, of glutting certain markets with early walnuts while others were bare, by a system of furnishing practically all our trade with a very early supply of walnuts as a partial delivery, and then keeping them in a constant stock throughout the heavy consuming period, thus increasing consumption; we have established higher standards of grading and packing, thereby insuring the consumer a high class product; we have protected the jobber by giving him a guaranteed standard of crack, which must set out the minimum of good sound merchantable nuts any delivery must run. Our sales are made at a uniform price established by us for each grade at the commencement of harvesting season, and by guaranteeing these prices against our own decline we have gained the confidence of the buyer. By inaugurating our own sales department we estimate that our former marketing cost will be cut almost in half, and owing in no small measure to these developments we are now making the grower a reasonably satisfactory return, while the consumer is securing a better article at no increase in price. The grower is now receiving the middleman's former profits.

At present we are distributing our goods in 44 of the 49 states and supply 280 jobbing centers through 721 jobbers. We sell to the wholesale trade only. We are constantly working toward the improvement of our grade and pack, it being our endeavor to make the Diamond Brand, under which we ship all our first-class goods, stand for the highest grade of walnut obtainable anywhere.

The walnut industry in this state is slowly but constantly increasing. A normal crop is now over 25,000,000 pounds. The average consumption of the United States, however, is over 60,000,000 pounds, so there are obviously opportunities for the further development of this industry, and in my opinion it is only a question of time until there will spring up large and profitable walnut districts to the north of Southern California. I also beli[illegible] the grower would receive just [illegible] same, if not a better price, if the California production was increased 50 to 75 per cent.

Some fresh deciduous fruit is shipped from America to Uruguay, but most of the green fruit on that market comes from Tasmania and Australia.

Farmers Express Opinions

Still Endeavoring to Figure Out How a Farmer Can Farm on the Eight-Hour System and as yet See Only Failure if the Initiative Measure Passes

W. A. Johnstone, Los Angeles

The proposed eight-hour initiative measure, which is universal in its application and compulsory, should be defeated. If a majority of those who vote on it favor it it will immediately become the law of the state and cannot be amended by the legislature. It can be changed only in the same manner in which it was adopted, by submission to a vote of all the people of the state. It is held by some people who favor an eight-hour day that a liberal construction will be put on the law if adopted and that farmers will be permitted to override the law in harvest times and stress periods of labor. A careful reading of the law will show that the measure has been most carefully drawn to prevent any free construction of its terms, and the courts are more than likely to say: "as the people themselves voted, so shall it be." The only presumption that can be taken is that the law, if adopted by the people as a whole will stand and be enforced until changed by themselves, and in the ordinary procedure, two years would be required to do it. There is no elasticity in its terms to allow any gradual adaption of any business to its provisions. To suddenly apply a rigid law of this character to every business of the state is apt to do great harm and little, if any, good.

The agricultural interests of the state are greater than all others, and a consideration of this law in the columns of the Cultivator must naturally view its effect from this angle. At the present time the agricultural statistics show that the California farmer and fruit grower is paying better wages and requiring shorter hours than the rest of the country. There is no general complaint by our workers against hours or wages. On the contrary, the workers eagerly accept the work offered and willingly put in long hours for the overtime pay in the harvest periods. It is extremely doubtful if with an eight-hour day anything like enough help is available to handle our grain, fruit, nut and vegetable harvests. If more floating help is imported, what will be done with these workers in the slack seasons? Furthermore the earnings of our agriculturist are not large enough to permit of any large increase in his expense account, so that if he must have more help he will be forced to reduce the pay of his old hands in proportion to the reduction of his hours of work in order to meet his increased pay roll for new hands required. His best men will then probably leave him for other fields where higher wages may be paid. The employer will find his work impeded in a thousand different ways. His work must all be carefully timed to avoid an infraction of the law. If overtime were permitted this would preclude his finding a valuable team and oufit abandoned by the roadside because of bad weather or accident. If he has a pumping plant and has a pump tender watching it, under the new law he must have three at a triple expense. Two night watchmen for our fruit packing houses will be required, where there is now competition for the places where the work is done by one man. Any farmer or fruit grower need only consider the application of this proposed law to his business very briefly to realize how difficult it would be to operate under it, and it must be remembered that the responsibility for an infraction of the law rests entirely upon the employer. There is no penalty imposed against the worker who violates the law. Any employer or his agent or representative who permits his employe to work more than 48 hours in a week is guilty of a violation of the law. He may not know that the man has worked already in the week for someone else or the workman may conceal the fact from him. Under the terms of the law this makes no difference; he is guilty if he "permits" it to be done. Further, he is guilty if his agent or representative "permits" it, without his knowledge.

From the worker's standpoint it is restrictive and prohibits him from selling to any one one minute more than a specified amount of his product which he has to sell, and no matter how great his ambition or how dire his need he can market but 48 hours of his time in a week; no more unless there come a fire or flood. Unless there are sound reasons of public policy to the contrary, every adult male should have the right to sell his labor as he sees fit. Such a restriction as is proposed by the eight-hour law would destroy all initiative on the part of the worker, operate to create a practical monopoly of labor and reduce the ordinary workingman to a form of serfdom that would be intolerable in America.

In its terms, the measure is so similiar to the eight-hour bill introduced by the Socialist member from Los Angeles at the last session of the legislature, as to betray its origin. His bill was refused passage by the legislature. It had the perfunctory support of the union labor lobby but it was privately admitted by some of them that a law of this character was impractical at the present time. It is my opinion that the eight-hour standard for a day's work will be, in time, adopted, but such a change must be made in such a manner that both the business and the worker can be adapted to the change without unnecessary disturbance.

HERE IS THE EIGHT HOUR LAW

"An Act to amend the Penal Code by adding a new section thereto, to be numbered 393½, limiting the hours of labor of employes and providing a penalty for violations of the provisions of this Act.

"The People of the State of California do enact as follows:

"Any employer who shall require or permit, or who shall suffer or permit any overseer, superintendent, foreman or other agent of such employer, to require or permit any person in his employ to work more than eight hours in one day or more than 48 hours in one week, except in cases of extraordinary emergency caused by fire, flood or danger to life or property, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not less than $50 nor more than $500 or imprisoned in the county jail not less than 10 nor more than 90 days, or both so fined and imprisoned."

R. Schellens, Redwood City.

It seems to me that the initiators of the eight-hour law are the worst enemies of the laboring man. How is the laboring man helped if conditions are created that make it impossible for the employer, especially the small employer, to exist? And suppose we would get this foolish law and it would work contrary to the expectations of its friends—as it surely will—would they then propose to give us a six-hour law or a four-hour law, or would they prefer a day off twice a week with full pay and full board and music band entertainment? If times are hard, can they be made better by working less, and would in that case the cost of living be decreased or rather increased? Also, in this country of many opportunities, we are so lucky as not to have as yet a working class such as they have in the older countries. Any person that is sober and healthy in mind and body has a thousand chances to improve his condition, and if he is a laborer today, he is under ordinary circumstances an employer within a few years from now. What we want then is not laws that make this change from employe to employer harder, as this law will do, but laws that will encourage the thrifty, the men that have saved their money to invest it in industries, in farms and other improvements. This would create a condition equally desirable for employer and laborer. It is exactly as Mr. Bloch from San Diego County in your number of July 2nd says:—this law, if enacted, would be disastrous to the small employer; the larger employers would not feel it so much. But I should like to ask the gentleman from San Diego County, who is in favor of this law in spite of all that: Who is more desirable as a citizen, the large or small land holder? Also, I should like to know, what chances the laboring man has under this new law to become independent? As a large employer he cannot begin, and on a small scale he would have no show whatever. So this law would work directly toward keeping him down, would prevent him from improving his condition and would create that class distinction which we see in the old countries. May the workingman look out for the wolves in sheep skins.

G. H. Hecke, Woodland.

The Farmers' Protective League is gaining ground in the north, and I hope that the Citrus Protective League in the south is fully organized by this time to take up the campaign there. I enclose a copy of a proposed initiative measure, No. 13, for the state of Washington. You will note in this initiative measure, which is also fathered by the Socialist party, that the agricultural laborer is placed on a ten-hour labor basis, and that a more liberal provision is made for overtime. On the basis of such a law, something might be done in California with the next legislature, if the proposed eight-hour amendment is beaten in November.

Initiative Measure Proposed for Washington.

"An act prohibiting employers from

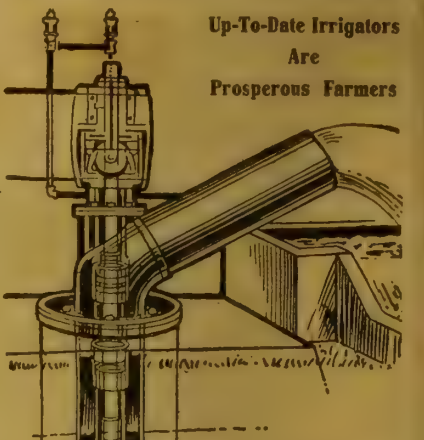
Up-To-Date Irrigators Are Prosperous Farmers



The LAYNE & BOWLER PUMP —almost invariably is the final choice of the modern, up-to-date irrigator. It has given him an unfailing and dependable water supply, has eliminated every disagreeable pumping feature, and has greatly reduced the cost of water. The Layne & Bowler pump is built to last—constructed of the most durable and strongest material, and is guaranteed to work perfectly under the most trying conditions. The World's leading water engineers highly recommend this pump.

THE LAYNE & BOWLER PATENT WELL SCREEN is built in any mesh desired, to meet any need —will absolutely control the sand and will increase well production.

Our Catalog No. 30 should be carefully read by everyone interested in irrigation. Write for it today.

LOS ANGELES, CAL.

requiring or permitting employes to work more than eight hours in any day of twenty-four hours, except in agricultural labor and cases of emergency; providing for extra compensation for overtime; and fixing a penalty for the violation thereof."

Be It Enacted by the People of the State of Washington:

Section 1. It shall be unlawful for any person, corporation, company or joint stock association to cause, require or permit any male or female employe in his, her or its employ to work more than eight hours during any day of twenty-four hours, nor more than forty-eight hours during any week of seven days, except that in agricultural labor an additional two hours per day may be allowed for work which is unavoidably and necessarily incidental to farm management.

Provided, however, that in case of extraordinary emergency, such as danger to life or property, or where such eight-hour limit would unavoidably and necessarily prevent other workers in the same mine, mill, factory or other industrial unit from working the full eight-hour day the hours for work may be further extended, but in such cases the rate of pay for time employed in excess of eight hours of each calendar day, shall be one and one-half rate of pay allowed for the same amount of time during eight hours service.

Section 2. If for any reason any of the provisions of this act shall be adjudged unconstitutional and invalid it shall not affect the validity of the act as a whole or any other part thereof.

Section 3. Any employer, overseer, superintendent or other agent of any such employer, who shall violate any of the provisions of this act, shall, upon conviction thereof, be fined for each offense in a sum not less than ten dollars nor more than one hundred dollars for each day during which such violation continues.

* * *

If an eight-hour law is necessary or wise at this time, something following the line of the above would show far better judgment than the bill which is proposed for this state. For example, note the emergency clause which permits, under certain conditions, overtime work for which extra pay is provided.

* * *

Edward Berwick, Pacific Grove.

Some alleged friends of the farm laborer have demanded our votes for an eight-hours a day, 48 hours a week, new labor law, enforced by fine or imprisonment against the housewife or husbandman, who shall dare to let their help work more than eight hours in any one day, or 48 hours in any single week. If maid or man work on Sunday, as is almost inevitably the case with such farm employes as dairymen, cooks, etc., the days then would be only seven hours each for six days and six hours for the seventh, making the 48 hours for the week. As much farm work includes the use of a team of from two to 32 mules or horses, the new law would practically mean the same short day for these; as a second shift of men would, at least in winter, be impracticable.

It is intimated that as much work would be done by the men in the reduced hours proposed as is done now. This certainly would not apply to the horses. It is presumable that the farmer himself should, with his wife, also be placed on the eight-hour footing. This then would involve the reduction of all farm work by one-fifth, and the diminution of farm produce by one-fifth. California now is credited with an annual agricultural product of $372,500,000. Reducing work hours from ten to eight hours, we get a rule-of-three sum, thus, as ten hours is to eight, so is $372,500,000 to $298,000,000. But this diminished output will cost about as much (for the same wages and food will be demanded by man and beast) to grow as does the present product. One of the first results then would be the raising of all food prices one-fifth, or failing that, the bankruptcy of the farmer, who, it is safe to say, does not now make a 20 per cent profit on his sales.

So to the humanities involved, at present the farm worker can spend ten hours earning his living in the open air, two hours eating his meals, four hours reading and eight hours sleeping. He has also in winter, days of enforced idleness on account of weather or soil conditions. He frequently works sitting, and under no oppressive surroundings.

But time is the essence of farm work; neither weather nor soil will await the laggard, and when a farmer's teams have laid idle three days in a week, it is ridiculous to send him to prison because he wants to work them ten hours a day for the other three days.

WHY JOIN THE FARM BUREAU ASSOCIATION?

Farmers sometimes ask the question, "Why should I become a member of the farm bureau association? I can get all the benefits of the farm bureau without becoming a member." Mr. L. A. Clinton answers in Farm Management Monthly as follows:

Every farmer and every other person interested in the success of the agriculture of a county should become a member of the farm bureau association because:

The farm bureau association is the organization in your county the purpose of which is to unite all the agencies of the county and bring them to work together for the advancement of the rural interests.

Agriculture is the only great industry in which there has been little, if any, community of interests. The time has now come when this community of interests must be established if the farmers are to reap their just returns from their business. All farmers of the community must be included if best results are to be secured.

While the county agricultural agent is expected to render assistance to any farmer in the county who asks his aid, those who are members of the farm bureau association, by reason of their familiarity with the work, are in position to make use of the county agent because they know how to use him. Half of the success in getting assistance is to know when we need assistance and where to get it.

The small annual membership fee is not a burden upon any one, yet with a large membership the funds so provided will do much to encourage the county board of supervisors to assist, and in the general betterment of the county each member will be amply repaid.

The county farm bureau needs the moral support which comes from a large and united membership. As farmers begin to work together for their own interests, opposition from other interests are certain to develop. A united front on the part of the farmers is needed to meet and overcome this opposition.

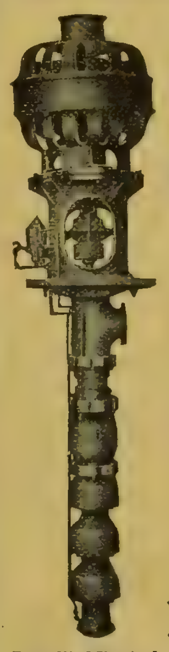
Membership in the farm bureau association should carry with it the right to vote in the election of officers of the association and a voice in saying what the work of the association should be in a county. This will tend to create interest in the association and should make every member feel that he is in part responsible for the success of the farm bureau, as well as give the bureau a sense of responsibility to him.

Any permanent improvement in the agriculture of a county must come through the work of the people of the county themselves. While the county agent employed will act as leader and coordinator of the forces [illegible] county, there must be forces to coordinate and people willing to work together under a competent leader.

This county farm bureau movement is not an economic movement only; it is also social, educational, inspirational. To be recipients only may result in decadence, but to be active workers for the general community interests, of which our own interests are a part, can only result in making strong, virile, public-spirited citizens The returns to the individual are far more than financial.

Life is for the most part made up of trivial incidents which have to do wth our own family relationships and with those people who with us make up our community. Just what these incidents shall be, whether pleasant and agreeable or otherwise, depends largely upon the attitude toward life. If all are united for the purpose of community betterment, for the purpose of seeing that each individual of the community has opportunity for the development of the best talents he possesses that he may thus contribute not only to his own happiness, but to that of others, rural life in America will come to mean far more than it has ever before meant.

"In union there is strength" is just as true today as ever. The farm bureau is designed to serve the entire community and has no selfish personal interests to advance. It therefore can justly claim for membership in the association the support of the entire community which it is designed to serve.



BYRON JACKSON IRON WORKS

Stand at the Head as Builders of

High Grade Irrigation Pumps

It is the most efficient pump of this type on the market and the simplest in construction; saves you money, time and worry, and we know you consider this of some consequence and worth while. Write for information and new bulletin showing new construction. We can furnish this pump direct connected to motor or for belt drive. Which will you have?

The BYRON JACKSON IRON WORKS are the oldest and largest builders of Centrifugal and Turbine Pumps on the Pacific Coast.

UP AT PORTERVILLE

While at Porterville a few days ago the editor was given a most delightful ride "in the gloaming" in the machine of Mr. W. E. Sprott, and from several sightly elevations views were had of orchards, alfalfa and grain fields in extent sufficient for a principality. We have not the room to write of the rich lands this week, but next week "An Alfalfa Feeding Proposition," will tell of the beginnings of what we believe will be a most successful scheme of marketing alfalfa "on the hoof."

Then there is Porterville's cooperative cannery. The Cultivator camera was there on the first day's run. We also have information regarding it which will be interesting to believers in cooperation.

MINIMUM WAGE

Workers at the headquarters of the socialist party announce that they will be unable to secure sufficient signatures to place the minimum wage law on the ballot in 1914. Other names will be solicited, however, and the aim of the party is now to secure sufficient signatures before January 1, 1915, so that this issue may be placed upon the ballot at the general election of 1916. The fight, while deferred, will be before the farmers within the next two years. This minimum wage petition provides for a daily wage of not less than $2.50 for adults between the ages of 18 and 60, and not less than $1.50 for persons under 18 years of age.

TRANSPORTATION PROBLEMS

The Association of Western Railways is sending out circulars appealing to all shippers and receivers of fruit to use all possible expedition in loading and unloading cars. Never have the crops of California equaled this year's. Every car which will hold up will be used to transport produce. Not only that, but the car should not be allowed to remain on the siding any longer than is absolutely necessary. This request of the railways is most reasonable, and the railways put it most reasonably. They ask that all products, such as coal, lumber and similar supplies, be shipped before the heavy crop movement starts, that cars be loaded to full capacity, that the receiver anticipate the disposition of his freight before its arrival, and, regarding loading and unloading quickly, "If, without additional cost, the use of greater force will get the load ready for movement or the car released more quickly, do it."

RAISE THE STANDARD

A new citrus growers' association has been formed at Porterville with the avowed purpose of shipping a grade of fruit which will command a market and at a materially advanced price over the ordinary run. Every effort will be made to hold each package of fruit up to the highest standard and make a fight for better returns because of this guarantee of quality.

Would not this be a wise move for every section of the state? The market is becoming more exacting every day; the competition is becoming stronger. In the case of oranges, Florida is enforcing standardization by a state law. California fruit shippers will suffer if they do not meet the demands of the market.

Besides the orange growers the grape growers are joining in this general movement; apple growers are discussing it, all fruit men are agitating legislation on this point. It is unfortunate that all of the growers and shippers, especially the latter, are not of a class which makes legislation unnecessary, but they are not, as conditions in the past have shown. The coming Fruit Growers' Convention to be held in Los Angeles will be a most opportune time to discuss such matters. Certainly enough legislation has been proposed which is discouraging to the farmers of this state; now let us have something which will be beneficial.

THE COVER

The illustration on the cover page of this issue gives many scenes in road-making in California. Each one of these shows some of the work being done by the state highway commission with the $18,000,000 road fund. It has not been possible for the commission to locate these roads where many people in the state have wished them. In fact, the funds at the disposal of the commission would not permit improving all the roads of the state, and that would be the only way to please all, but wherever they have been located the construction has been of the best. We grant there has been criticism from the contractors and their friends because the commission has held them rigidly to the fulfilment of their contracts, and also from others who wish good roads but prefer other forms of construction. But with the material at hand, we believe California will make such a showing for good roads—if it has not already—as has been made by no other section in the United States. All we wish will not be done when our visitors come next year, but between the work by the state commission and by the various counties, there will be hundreds of miles of permanent roads with durable foundations. Not only will they make a good impression upon our visitors, but they will make for more economical marketing of our products.

FUMIGATION DOSAGE

A perplexing feature of fumigating citrus trees for scale pests is the adjusting of the quantity of cyanide to the cubic contents under the tent. With marked tents and carefully figured schedules which make allowance for leakage, still indifferent work is done, yet fumigation is the most satisfactory process yet found for the control of many insects. Therefore, the vital question is how to secure more perfect results from fumigation.

The last year furnishes a case in point; many sections report complete failure of fumigation; others, almost as complete success. We have heard one grower say that he believes the indifferent work was caused by growers insisting that if trees showed any injury from fumigation they would bring suit for damages. Consequently the contractors were overcautious and the minimum dosage which they used gave minimum results.

No fruit grower should fear a little burning of the tender growth of orange or lemon trees, in fact, we know of some shrewd orchardists who have insisted that there should be some indication of burning on the tender growth of every tree in the orchard as it is to a certain extent an indication of thorough work.

Of course the effect of hydrocyanic acid gas is not yet thoroughly understood. Some atmospheric conditions seem to cause serious tree injury with the same dosage which has been safely used at other times. While no grower wishes to encourage treatment of his trees which will lessen their productive value, yet he should insist on thorough work being done. The fruit grower has enough obstacles to overcome without having to pay immense sums for ineffective fumigation and the dosage which is too light is of absolutely no value.

Another burden which the laborers have sometimes insisted upon placing on the orchardist is that fumigation gangs should consist of seven men; the usual foreman or estimator, the cyanide man, an acid man and then four tent men instead of the usual two. Of course, it must be admitted that where two men handle a 45-foot tent all night, especially when the dewpoint has been reached and the tent is saturated, they are engaged in hard work. But the burdens of the fruit grower must end somewhere or he must find some other business.

Agricultural News Notes

Texas expects to have a big honey crop this season.

The area planted in sugar beets in Bohemia this year is 352,839 acres.

Ireland's annual production of honey approximates half a million pounds.

Tasmania exports 5,000,000 rabbit skins each year, valued at $250,000.

More than 20,000 people die every year in India from snake bites, according to official reports.

The Cretan orange grown in Greece much resembles the navel, being thin-skinned, oval shaped, with few seeds.

A Georgia-Florida fair will be held at Valdosta, Georgia, in October, counties and citizens of both states exhibiting.

Sugar planters of the Philippines are reported in serious financial straits owing to the poor quality of their crops this year.

Russia this year has more than two million acres planted to sugar beets. Last year the total acreage was slightly over a million and a half.

The Greek government has established eight agricultural experiment stations. In each practical instructions are given. There are also two model farms.

Drouth has considerably cut down the cantaloupe yield in Indiana, and while the acreage is larger than ever before, the crop will be much smaller than last season.

In the campaign of the department of agrculture to extend corn growing in the Philippines it has been found that the corn grown in Moro province is much hardier than that grown in other sections. Consequently Moro corn is being utilized for seed.

Potato growers, dealers and railroad men met in Salem, New Jersey, on July 17 to confer on the matter of putting out better potatoes. The growers agreed to take care in digging, covering and grading the tubers, and the railroads to furnish ventilator cars.

In the Yellowstone National Park 12 successive forests, one on top of another, have been buried by outflows of lava and petrified, according to a pamphlet entitled, "Fossil Forests of the Yellowstone National Park,". issued by the department of the interior.

An American agricultural colony is being established in the Lanao district of the Philippines. There are about 100 families. Many of the men have been in government service either as soldiers or civilians and have married Filipinos. The government will assist the colonists by small loans.

The market price of olive oil in Syria is advancing This advance is attributed to the unsatisfactory prospects of the coming crop. On account of this increase cottonseed oil is now being imported from Egypt for mixing with native olive oil. Though this process is prohibited by existing regulations, the dealers of olive oil mix their oils with imported cottonseed oil without any hindrance from local authorities, who do not seem to be disposed to take any proceedings against them. Olive oil is worth there for first quality, about 12.45 cents per pound; second quality, 11.55 cents per pound; third quality, used in the manufacture of soap, 10 cents per pound. The actual price of cottonseed oil is 7.30 piasters per oke (9.68 cents per pound).

Agricultural News Notes of the Pacific Coast

Northern California

Oroville is sending out heavy shipments of green fruit daily.

The fifth Gravenstein Apple Show will be held August 3-9, at Sebastopol.

Napa County's new farm adviser, H. J. Baade, will take office the first of August.

Dr. Hayes, veterinarian at the university farm, reports a number of cases of hog cholera.

The farmers of Mendocino County had a big picnic and barbecue last Saturday at Clark's Grove.

The Dinuba Melon Growers' Association has already passed the 100-car mark in shipments of melons.

The first definite price reported on Thompson Seedlesss was from Yuba City. It was $14 per ton on the vines.

Dried fruit packing concerns are being urged to put up small boxes of assorted dried fruits as an advertising feature.

Farmers of Placer County have organized a branch of the Farmers' Protective League to fight the proposed eight-hour law.

In his June report Horticultural Commissioner Bowman of Placer County reports that much injury has been done by the pear slug in ochards.

Systematic experiments with pruning of apricot trees are to be made in the Winters section under direction of Horticultural Commissioner Hecke of Yolo County.

Hop growers of the Sacramento Valley are again having trouble with the I. W. W'S. It is reported that a general strike of hop pickers has been ordered for August 10th.

The Alameda County Farm Bureau has not yet secured sufficient members to insure the appointment of a farm adviser, but they are still working for additional members.

Some of the grape growers who have joined in the movement to prevent shipping of unripe fruit are planning to bring the matter up for legislative action at the next session.

The grange of Patrons of Husbandry, established at Rutherford in Napa County less than a month ago, already has a membership of over 100. The construction of a grange hall is now being considered.

An irrigation project has been launched in the Anderson-Cottonwood District, of Shasta County, to place water on 30,000 acres between Redding and the north line of Tehama County. It has been estimated that water can be placed on the land for less than $12 an acre.

The warden of San Quentin has announced that there are plenty of grain sacks available now at 8½ cents, to fill all orders. Earlier in the season no orders were accepted for more than 10,000 bags. This restriction was made to protect the small farmer from speculative buyers.

Directors of the Ukiah Hop Festival Association are making plans for the coming festival and county fair to be held in Ukiah, September 15 to 20. Of the $1250 appropriated by the county for premiums $600 will be used for agricultural awards, $500 for stock and $150 for poultry. The association expects to add to these amounts.

Central California

Tuscan Clings are being picked in Stanislaus County.

Citrus growers of Tulare County have begun fumigating for grey scale.

Olive growers of Tulare County are planning to organize an olive association.

Onion growers have been receiving extra good prices for their crops this year.

Stockton is shipping from 12 to 20 cars of onions a day to eastern markets.

Tulare County citrus growers are putting up a stiff fight against the gray scale.

W. N. Barr has been appointed grape tester and inspector at Dinuba, Tulare County.

The State Beekeepers' Association has decided to make an exhibit at the Panama Pacific.

The citrus men of Porterville, Tulare County, state that one of the finest crops of lemons in the history of this district is in prospect.

Apple growers of the Pajaro Valley met at Watsonville on July 20 to try to devise some plan to keep out cull apples shipped in from other states.

Visalia's first fruit train for the East left July 20th. The train consisted of 24 cars of green fruit bound for Chicago. It will be on the market in four days.

A number of meadows of the Sequoia National Forest have been set aside for the use of tourists and campers, and have been fenced against range cattle.

Picking of Thompson Seedless grapes has been suspened at Turlock for several days, owing to a misunderstanding regarding the temperature at which the grape should test 17 per cent sugar.

Turlock melon growers are now receiving prices ranging from $7 to $9 per ton. The volume of shipments is steadily growing, and the prediction is made that the $5 mark will be reached soon.

A new orange growers' association has been organized at Porterville, Tulare County. It takes the name "Comet Association" and has leased a packing house of the Porterville Citrus Association.

The Porterville Citrus Association has made changes in its by-laws whereby picking, packing and grading of fruit are placed under control of officials of the association. Fruit for early market is to be judged by palatability and appearance.

The first annual California State Dairy Fair will be held in Modesto, October 14-15. The fair is backed by six organizations, Creamery Operators, Creamery Managers, State Dairy Association, Jersey Cattle Club, Holstein Friesian Association and Live Stock Breeders.

Thompson Seedless and Malagas are now being shipped out of the valley and the California Green Fruit Growers' Association already has two or three inspectors watching to see that the fruit comes up to the required sugar test. More inspectors will be put to work as shipments increase.

Southern California

Beaumont, Riverside County, is shipping out early apples.

The great San Joaquin Ranch of Orange County has 21,000 acres in beans this year.

Date growers of Imperial Valley met July 25 in El Centro to form an organization of valley date growers.

Grape growers of the Imperial Valley estimate that their output this year will reach close to 150 carloads.

The Fruit Growers' Association of Beaumont has let the contract for a new packing house.

Bee men of the country about Beaumont, Riverside County, report a large yield of honey of extra quality.

From Oxnard comes the statement that the Lima Bean Growers' Association is not satisfactory to many members.

Bloomington, San Bernardino County, has formed a protective association to fight scale and other tree pests.

President Murish of the Heber creamery is urging cooperation in marketing of the various creameries of the valley.

Because of technical defects the courts have declared the California game law of 1913 unconstitutional. This restores the old game law of 1911.

The Orange County sealer of weights and measures has announced that he will hold dealers as well as producers responsible for short weight packages of berries.

A number of citrus growers of the Alta Loma district, San Bernardino County, are considering withdrawing from the Cucamonga Association and building a new packing house at Alta Loma.

Coachella, Riverside County, has shipped several carloads of Thompson Seedless. The first car of grapes shipped from this point was mixed Thompson Seedless and Malagas and brought $2480.00 in Chicago.

The work of pitting apricots is ended in Orange County. The fruit in many sections is reported as too small to pay for harvesting. In other sections much fruit went to waste because growers were unable to secure sufficient help.

Scale is reported very numerous on citrus orchards in the Rialto district of San Bernardino County. The Rialto Orange and Lemon Assocation has opened a campaign against the scale, with its first consignment of spraying material amounting to 20 tons.

Ranchers of the San Luis Rey Valley of San Diego County are harvesting their sugar beets, which are being shipped to the Santa Ana Sugar Factory. The planting in the San Luis Rey Valley this year amounted to 2000 acres and the yield was very good.

The Boys' Agricultural Club of the El Cajon Valley, San Diego County, high school held an open meeting July 23, when samples of corn raised by dry farming methods were exhibited. County Farm Adviser Armstrong and County Horticultural Commissioner Weinland were among the speakers.

The Coast

According to the July crop report, Arizona will produce 592,000 bushels of corn.

The Farmers' Produce Association of Willcox, Arizona, is making plans for a fall agricultural fair.

The first consignment of Malagas received in Spokane from California, sold for 20 cents a pound.

The Hindoos who have been trying to land at Vancouver have finally given up the fight and returned to India.

Cool weather in Portland has seriously checked sales of melons. Several dealers have cancelled their orders.

Some ranchmen of Arizona are experimenting with silos of adobe lined with cement, placing them half below ground.

The British Columbia Federation of Labor has passed a resolution demanding the exclusion of all Asiatics from Canada.

The recently appointed demonstrator of Utah County, Utah, has begun his work with headquarters at Provo. The new adviser is Mr. A. B. Ballantyne.

Directors of the Oregon State Fair announce that dairy prizes for this year's exhibits will be much larger than ever before. The list of awards has been published.

Wool growers of Utah have been conferring on the matter of improving their grading and pack of wool. They hope to adopt the Australian method of preparing wool for market.

Many apple growing districts of the Pacific Northwest will exhibit at the 20th annual convention of the International Apple Shippers' Association in Boston, Massachusetts, October 5-7.

The Washington state department of agriculture has issued a report estimating fruit shipments from all commercial fruit districts for the year at 17,000 cars, as compared to 11,895 cars last year.

Concession in freight rates, to take effect in the near future, is promised Northwest fruit shippers, which will save between two and one-half and three cents per box on peaches to Missouri river and eastern points.

The Willamette Valley Prune Growers' Association of Salem, Oregon, has recently celebrated the fourteenth anniversary of its foundation. It is one of the oldest cooperative fruit associations in the state.

The Montana quarantine against Utah fruits and vegetables will be raised on August 1st, provided each consignment of fruits or vegetables bears an official certificate from the state horticultural inspector of Utah.

According to recently compiled statistics the Yakima Valley Fruit Growers' Association shipped over 1,000,000 boxes of fruit in the season of 1913-1914. Peaches were the largest single item, over one-half million boxes being shipped.

The Fruit Growers' Association of Gresham, Oregon, has elected the following officers for the ensuing year: president, H. E. Davis; vice-president, James H. Sterling; secretary, Karl H. Miller; treasurer, Bank of Gresham. James H. Sterling was appointed field manager until the annual meeting in January, 1915.

The Secret of Making Profit out of Stock GILBERT HESS, Dr. of Veterinary Science Dr. of Medicine

I want all you farmers to get this fact riveted in your mind regarding stock—that the only animals that are paying you a profit are those that are *digesting* their feed—bowels regular every day and absolutely free from worms.

And it is just at this very time of year when stock are not in that condition, because they are cooped up, deprived of exercise and for the last few months have been on dry feed, which does not contain the laxatives and tonics so abundantly supplied by grass.

Dr. Hess Stock Tonic

Aids Digestion Makes Stock Healthy Expels Worms

Being both a Doctor of Medicine and a Doctor of Veterinary Science I formulated Dr. Hess Stock Tonic to aid digestion, make stock healthy and expel worms.

This scientific, 21-year-old preparation contains highly concentrated tonics that improve the appetite and aid digestion, laxatives for regulating the bowels and vermifuges that expel the worms.

Remember, it's the cow in the pink of condition that fills the milk pail, the steer with an appetite that lays on fat, the horse that enjoys its dinner that pulls on the bit, the hog that is healthy and free from worms that gets to be a 200-pounder in six months.

Dr. Hess Stock Tonic will positively put your stock in these conditions. So sure am I that it will, that I have authorized your local dealer to supply you with enough for all your stock and if it does not do as I claim, return the empty packages and get your money back.

Dr. Hess Stock Tonic is never sold by peddlers—only by reliable dealers whom you know. I save you peddler's salary and wagon and team expenses, as these prices prove: 25-lb. pail $2.25; 100-lb. sack $7.00. Smaller packages in proportion.

If not sold by your dealer, write direct to

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Poultry Pan-a-ce-a

A splendid tonic that tones up the dormant egg organs and keeps the hens scratching and happy and laying all through the winter. Shortens moulting period and promotes rapid feather growth. Nothing better to make chicks strong and healthy. Cheap—a penny's worth is enough to feed 30 fowl per day. Sold only by dealers whom you know. Never sold by peddlers. 1½ lbs. 35c; 5 lbs. 85c; 25-lb. pail $3.50. Guaranteed.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks or, if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 35c, 3 lbs. 85c. I guarantee it.

ALFALFA TEA

We recently had request from a subscriber for information as to the use of alfalfa tea to feed pigs. He referred to the fact that he had seen an article by a Dr. Suddith in which it was claimed that the tea made by steeping alfalfa hay was recommended as practically equal to or better than skim milk for raising pigs and calves; also that the residue after the steeping of the tea was even more nutritious than the original alfalfa hay. This looked a little bit too good to be true, and in our bibliography of alfalfa we could find nothing referring to such authority on alfalfa. However, we took the matter up with Professor Woll of our own state university and with the Wyoming and Idaho state experiment stations. We give first Professor Woll's reply to our request for information:

"I know of Dr. Suddith's experiments with preparing alfalfa for hogs, through hearsay only. There appeared an article on this method of feeding in the Saturday Evening Post about two years ago, written in the usual style of that paper, in which some very wonderful results were obtained in feeding alfalfa tea to hogs in place of skimmilk. I did not see the article myself, but I understood that he claimed that the alfalfa left as residue in making the hay-tea was richer in digestible protein than ordinary alfalfa hay. I am sorry that I cannot give you the exact reference, nor do I know Dr. Suddith's initials or address. It is possible that Prof. W. J. Spillman of the bureau of plant industry, U. S. department of agriculture, Washington, D. C., can give you the information desired, as he has a very extensive acquaintance in the western states and keeps in close touch with the work relative to alfalfa culture."

From A. D. Faville, animal husbandman at the state agricultural college at Laramie, Wyoming, we received the following letter:

"In reply to your letter of a recent date I would say that the Dr. Suddith to whom you refer is a Montana man, and the article you have in mind is probably the one which appeared in the Saturday Evening Post some time ago. This article was written in a popular style without very careful regard for facts. Alfalfa tea was the thing recommended in this article, and great things were claimed for it. I have tested the clear tea out and find that it has very little feed value, not enough to pay for the trouble of preparing it. In this article cited many other things were mixed with the tea, and apparently the grounds were utilized, so that we had no way of determining what really constituted the valuable materials. Alfalfa meal mixed with grain makes a satisfactory ration. The amount used will depend on the length of time one wishes to carry the pigs. Larger amounts of alfalfa mean slower fattening. Hogs will use alfalfa hay to advantage and they will take it out of most any ordinary rack that is built so that they can get the contents easily. I doubt whether it would pay to grind the alfalfa under ordinary conditions unless it seems desirable to mix the hay with the grain ration, and cutting may be resorted to for this use."

E. J. Iddings, animal husbandman at the Idaho agricultural experimental station at Moscow, writes:

"I know of no experiments conducted in this state by Dr. Suddith on the best method of preparing alfalfa for hogs. Considerably over a year ago there was some discussion regarding a report supposed to have been sent out by Dr. Suddith of Montana claiming very remarkable results from feeding alfalfa tea to hogs. The more practical hog men at that time looked upon the report as entitled at least to doubt; and, since the feeding of tea seems to have advanced no further, and nothing more is heard of the matter, I take it for granted that the doctor was either misquoted or sent out information that was not accurate.

"Alfalfa hay may be fed to hogs either whole, cut into short lengths, or ground into meal. The most reliable and accurate information concerning the feeding of alfalfa to hogs that I am acquainted with has been obtained by experiment at the Nebraska experiment station. As a result of more than five years' tests, with accurate records kept and the turning off of a very large number of hogs, the results of these experiments summarized by the Nebraska station indicate that the feeding of a fine quality of alfalfa hay whole in a rack is, under average conditions, the most economical way of feeding it. There are increased returns from cutting it into short lengths; but not more than enough to pay for the cost of the operation. The grinding of alfalfa into meal, on account of the rather expensive process, results in no advantage, and in most cases in a loss as compared with the feeding of alfalfa whole. These results have for the most part been carried on in the western part of the state, where an excellent quality of alfalfa is grown, and I take it, they are applicable to Idaho, neighboring states, and California.

"We have done some feeding of alfalfa in this state experimentally, and in addition, a very large number of our hogmen make a wide use of alfalfa hay in hog feeding. Our results here would tend to support the Nebraska position, although some farmers seem to think there is a wonderful advantage from grinding the alfalfa into meal."

MORE LIVE STOCK PER ACRE

Written for the California Cultivator
By Sacramento Valley Contributor

There is a wide difference this year between the price of feed (alfalfa and grain) and finished meat products. Alfalfa and barley are abundant and cheap everywhere, particularly in the great interior valley, and every pound of this feed should be made into meat, milk and eggs to cut down the imports of these products into the state.

In the Sacramento and San Joaquin Valleys we have a territory that could and should produce more live stock products per acre of developed land than any other district of its size in the world, and some day it will do it. The reason for this is the great quantity of rich feed that can be produced per acre and the favorable climatic conditions. The claim that on heavy land feed yard conditions are bad during wet weather, is true, unless floored yards are provided to keep stock out of the mud, but this expense is nothing as compared with the cold winter weather stock feeders must contend with in the east. Cold weather costs feed for keeping the animal warm that might otherwise make gains, while feeding floors or sheds are a comparatively permanent improvement that costs very little per animal fed when a long period of years is considered.

We must breed and grow more stock on the farms of the valleys. The supply of feed on the ranges is too uncertain to make range cattle and sheep for feeders a dependable supply for the consumption of valley alfalfa and grain. One or two years of drouth like 1912-1913 tends to create a shortage of stock cattle and sheep that makes a big surplus of feed, such as there is now. Increasing consumption of alfalfa is another factor that makes a more constant supply of feeder stock necessary.

We have this year 1,000,000 tons of barley, the biggest crop ever grown in the state. In 1907 the previous maximum was reached with 739,000 tons. An indication of the increase over last year is that over 20,000 tons will be shipped from Colusa, in Colusa County, this year, while the tonnage carried on the whole upper Sacramento river last year was only 35,000 tons. We also have the greatest alfalfa crop in the history of the state, and probably the largest corn crop.

The man who has a lot of hogs or cattle that he has raised, or cattle or sheep or hogs that he has bought at reasonable prices, should be able to make a nice profit feeding grain and hay at present prices.

WHITE FACE HORSES

We may go a century from childhood and still find truth in the old nursery rhyme. We find evidence of it here every day. Not long since the following came from a reader who does not want his name printed:

"I want to enter a protest against the horse pictures you have been publishing in your paper. White-faced horses are not desirable; a big per cent are soft horses. The Clydesdale colt, pictured recently in the R. N. Y., valued at $5,000, is worth about one per cent of that sum. These big, soft horses are many of them worn out at 12 years of age. There is one thing to be said in their favor; their bones are big and they are worth more for fertilizer and knife handles when no longer useful. Were I the editor of The R. N. Y., no white-faced horse pictures would be printed. Do not lend your influence in this direction; bar out such pictures along with the fakes not for publication."

We find that what various gentlemen would do if they were editor to be among the wonders of the world. We have a brewer who protests at every reference to temperance, and many who want three pages on prohibition in every issue. At a fruit growers' meeting a well-known farmer cursed the dairy cow and never wanted to hear of her again. On the same day another man said he wanted nothing but cow. One man said his wife disliked The R. N. Y. because it contained the picture of a hog. Another woman said the hog had paid the mortgage on her farm. The fact sems to be that if all these would-be editors had their way there would be nothing at all printed in the paper. Our people are generally broad-minded and fair, ready to think and conduct a fair discusion. As for white-faced horses, we have three on the farm that are very satisfactory. Here in New York, out of about 500 colored horses examined, over 400 had a star, a stripe or a full white face. On referring the matter to Dr. Alexander, we received the following:

CANNED CORN FOR CATTLE

Two months on board ship without green food will give men the scurvy. We avoid disease on land in the winter time by eating canned vegetables.

Since a partially green diet is so important, physiologically, is it surprising that domestic animals thrive so much better when we can the growing crops of summer for their winter feed?

The first man who ever put up silage for his cows reasoned that if the fresh green grasses and fodders of spring would increase the flow of milk so remarkably, the same green things fed in the winter should maintain the increased yield. His faith was amply rewarded—and today we have a silo on almost every modern farm.

Since time immemorial white-faced, "bald" or "blazed" horses have been popular in Europe. It is characteristic of the heavy draft stock of Great Britain, founded with blood of the ancient "black horse" of Flanders, and it no doubt is the origin of the "star" or "stripe and "snip" in horses of other breeds, notably the Percheron. All of the farm work and heavy hauling on the streets, and about the railroad stations and docks of England and Scotland, and most of the work of the same sort in Canada, is done by grand draft horses of this origin. The accusation of your correspondent is unjust, prejudiced and not based upon intimate knowledge of the facts. A few hours upon a street corner in Toronto, Melbourne, Glasgow, Liverpool, London r Dublin would be likely to change his opinions.—Rural New Yorker.

While a reporter was telephoning his story from Sing Sing early one morning, a convict hammering on the floor made it hard for the reporter to hear. "Would you mind stopping for a few minutes?" asked the reporter.

"All right, boss," said the convict, "go to it. I got 20 years to finish this job."—F. P. A., in New York Tribune.

YOUR COWS
Need Nourishing Butter Producing Economical Feed
Messrs. Willits, Patterson & Green, June 18, 1914.
342 So. Hill St., Los Angeles, Cal.
Gentlemen:
In response to your inquiry as to the desirability of Cottonseed Meal as a food for cattle, we beg to advise that we killed a large number of cattle last winter and during the early spring months that were fed on cottonseed meal. The quality of the beef proved quite satisfactory and the percentage of yield compared to live weight was very good. We believe it to possess very valuable qualities for the fattening of live stock.
Very truly yours,
THE CUDAHY PACKING CO., R. Scott, Manager.
FEED COTTONSEED MEAL and HULLS
According to Government investigation this feed contains more digestible protein than any other. Cows like it——horses thrive on it—hogs fatten on it—chickens lay more eggs on account of it.
ECONOMICAL — EASY TO FEED
Send for interesting booklet. It tells how to feed it and gives a complete treatise on its many uses.

Cut Your Cost of Producing Milk

One of our customers who is using two 20x40 silos says:

"By siloing my first and last cuttings of Alfalfa I cut down my mill feed bills over $4000.00 in one season, and the feeding of the Ensilage with chopped Alfalfa Hay increased the milk production from my 300 cows at least 10%. I consider the Silos saved their original cost the first season."

Ideal Green Feed Silos are a **De Laval Product**, made of the best materials in the best equipped mills on the Pacific Coast, and in every essential feature are built to suit California climatic conditions and to produce good Ensilage.

You would not purchase a leaky can for preserving fruit. Why take chances on a leaky silo when you can buy a perfect Ideal Green Feed Silo.

Bees and Their Care

ALFALFA SEED AND BEES.

In certain locations, as in northern Montana, bees are very scarce, but alfalfa will often produce good crops of seed without their aid. A crop of alfalfa seed is never obtained except when the flowers have been "tripped," which term describes the snapping back of a part of the flower in such a way as to deposit pollen on the stigma. Production of seed usually results from this action. Bees in search of honey or pollen "trip" some of the flowers, but there are two other ways in which the action may be performed. In some cases the flower will "trip" itself automatically (as it does in Montana) if the climatic conditions are satisfactory, or the flowers may be "tripped" artificially by human agency.

Of the three agencies that may "trip" the alfalfa flower only the insect naturally carries the pollen from flower to flower. As pods form in artificially tripped flowers it is evident that flowers do not necessarily need pollen from others in order to become fertilized. Moderately warm weather interspersed with cool nights is a condition that seems peculiarly favorable in aiding flowers to "trip" themselves. When the weather cools off the flowers do not "trip" so readily.

Investigations have shown, however, that pollen brought from other flowers will produce more pods than does the flower that is self fertilized. Thirty per cent of the flowers fertilized with their own pollen produce pods, while 46 per cent fertilized with pollen from other plants produce pods. In the former case the pods each contain an average of 1.4 seeds, while in the latter they contain 2.4 seeds.

Honey Bee of Little Aid.

Investigations of the United States department of agriculture have shown that a mistaken notion has been held regarding the kinds of bees that aid alfalfa seeding. While "leaf cutter" bees will "trip" about 90 per cent of the flowers they visit and bumble bees about 50 per cent, honey bees "trip" less than five per cent. Even though a honey bee trip only five per cent of the flowers it visits the great number of such bees that can be kept on an alfalfa field taken in connection with their activity compensates for the low efficiency of each bee.

The wild bees that are most efficient in tripping do not store up honey of commercial value, nor is there any way known of holding them permanently in any locality.

Certain investigators have thought that some species of bee from the native land of alfalfa might prove more valuable than others. If such could be found and introduced the yield of alfalfa seed might be materially increased. There are so many different kinds of bees in different parts of the world that there is considerable room for experiment.

The principal growers of American alfalfa seed are located in eastern Colorado, Kansas, Nebraska, Utah and Montana. In the east the market for alfalfa hay is so attractive that there is little interest in growing alfalfa seed. However, there is a good field in certain states for increased production of seed, as there are still heavy importations of inferior seed from foreign countries. Over $676,000 worth of seed was imported in 1913.

OPERATING THE BEE SMOKER

In using the smoker for quieting the bees, fuel is needed that will furnish plenty of smoke and will at the same time last a long time. It is very exasperating to say the least, to set your smoker down and then find that the fire has gone out and there is no smoke just when you need it most. One of the best materials for fuel that I know of is an old gunny-sack. If this is just a little damp it makes a lot of smoke and burns slowly. Moreover, it is very convenient to handle when prepared in the proper way.

Roll the sack into a long roll and tie strings about every four inches beginning two inches from the end. Then take a sharp hatchet and chop the sack into sections, cutting between the strings. This gives you sections just about the right size to fill the smoker and in a form that is easily handled. One of these will furnish plenty of smoke for a long time. Usually one is enough for all of the work with one hive or more. If a gunny-sack is not to be had, any old cloth of similar texture may be made to serve.—Farm Stock and Home.

PRODUCTIVE ORCHARDING.

Productive Orcharding, Modern Methods of Growing and Marketing Fruit, by Fred C. Sears, M. S., Kansas state agricultural college, published by J. B. Lippincott Company, Philadelphia, at $1.50, net. The Cultivator will be glad to secure the book for its subscribers at the above price or, including a year's subscription to the Cultivator, at $2.35.

This book is one of Lippincott's Farm Manual Series, which is edited by Kary C. Davis. It is an exceedingly well printed and bound volume of 316 pages, illustrated with many copper plate engravings. There are 22 chapters touching upon: The Outlook for Orcharding, Orchard Lands, Selecting Varieties and Buying Nursery Stock, Establishing the Orchard, Cropping the Orchard, Orchard Culture, Orchard Implements, Fertilizers, Cover Crops, Pruning, Orchard Insects, Diseases of Fruit Trees, Spraying Apparatus, Spraying Materials, The Spraying Campaign, Renovating Old Orchards, Picking and Handling Fruit, Storing Fruit, Grading and Packing, Marketing, Advertising, Laws affecting Orcharding.

"If the agricultural history of the twentieth century is ever written the writer believes that one of the most significent features of such a history will be the account of the great interest in orcharding which developed during the latter part of the first decade of the century. That interest is still at its height. Men from all walks of life are turning toward orcharding as the one branch of farming in which they would like to engage. Wealthy men are setting out orchards (and commercial orchards) on their estates, farmers in orchard sections are enlarging their fruit plantations, while bank clerks, insurance men, and retired ministers are either investing their savings in small farms which are to be set out to fruit trees, or have bought an interest in some development scheme in the West. No wonder that there is a shaking of heads among the conservative element of our fruit growers and a wondering as to what the outcome will be. No wonder that even the most enthusiastic advocates of orcharding are speculating as to whether it may not be overdone."

While the book is written from the standpoint of an orchardist whose experience has been entirely in the East, the Pacific Coast orchardist will find many suggestions of value. Especially valuable are the chapters on packing and marketing.

Profit in the Poultry Yard

REARING LATE HATCHED CHICKS

Written for the California Cultivator
By E. E. Cauble.

In past years most poultry men, small and large, have bent all their efforts to raising poultry in February, March and the first part of April. And this placed the entire output of broilers and fryers on the market almost in a single month, thereby congesting the market and making this branch of the business less profitable. Now we are learning better methods of handling chicks, also of marketing, and it has made possible the profitable raising of chicks during the summer months—May, June and July.

The first thing to consider in raising chicks in summer is the condition of the parent stock. After the hens have laid during the winter and spring their organs of reproduction are somewhat impaired and sometimes the one that cares for them gets a little negligent as the season rolls on, and doesn't provide such a variety of feed — allows the shell, charcoal and grit boxes to remain empty part of the time, or does not supply succulent greens, etc. Renew your energy, give your hens more variety; give them appetizing mashes and if necessary a little tonic twice weekly—they need it, just as you do sometimes. Clean up the yards and houses, spray the nests thoroughly early in the morning. Don't be stingy with the lice paint; saturate the nest material till the hen's feathers underneath are colored and your louse troubles will soon end, your hens will lay and the eggs will hatch strong chicks that live and grow, but you can't have fertile eggs, lice and mites at the same time.

As the season grows later our methods of handling the incubators should also vary. If we should run the machines at the same temperature in May and June as in February and March and not cool and air the eggs any more than for the early months, our chicks would mostly die in the shell and those that did get out would hardly be fit to raise. We would run the incubators at 102 and 103 degrees in the early months, but for May, June and July, start at not over 101 degrees, increasing to 102 degrees the last week, and at hatching time you will have a hard time to hold it anywhere but 103 or 104 degrees. Cool the eggs twice daily, not long the first week, as they cool rapidly, but the second week, 30 minutes to an hour, and the last week half of the time would hardly hurt them. They must feel cold to the hands before they are returned to the machine—the doors of the machine should be left open during the cooling in hot weather. Early in the morning and late after sundown are best for cooling the eggs, as the air contains more moisture. A damp cloth or sponge should be kept in the machine the first five days, then returned when the eggs begin to pip.

Caring for the Chicks.

The little chicks should be kept in a dark warm place at least 24 hours after all are hatched, with absolutely nothing to eat or drink and as quiet as possible.

As to brooders, I prefer a hot water system for summer; it gives a soft, damp heat better adapted for hot dry weather, although fireless brooders may be used successfully, putting only about 30 or 40 chicks to a brooder or hover 18 inches square.

Most any kind of a brooder will do, providing it has plenty of fresh air and the chicks are not allowed to remain out too long and get cold. Watch them. See that they all get in at the proper time for a few days. The best nursery feed for the first few days is made from bran, bread crumbs and boiled egg, with finely pulverized charcoal. Knead the whole mixture together till it becomes moist like freshly baked bread, and feed nothing but this on clean boards or fresh, damp earth five or six times daily, just a little at a time. Use a very little sand or fine grit scattered with feed. Do not allow chicks access to quantities of sand when they are first fed, as they do not distinguish between sand and feed at first, and being eager to pick up everything, will eat too much sand and die with inflammation or packed bowels and you will think it white diarrhea.

On the second day a little bran in a shallow dish may be given. Third day add a little shorts to bran and scatter a small quantity of commercial chick feed where they can hunt for it, for next few days. Add fine-ground bone (small quantity) to mash of bran and shorts, then a little blood meal or fine meat scraps and discontinue the boiled egg. Give a little greens to pick at.

Here I would like to say a few words in regard to disease and remedies. Chickens are susceptible to as many or more diseases than the human being, and if you don't feel just right you consult your physician or get some good, reliable family medicine and try to correct the ailment at once. So it is with chicks or old fowls. If you would be successful you must be prepared to combat their ailments.

There are many first-class preparations on the market that are reliable and sure if used rightly, and I would advise keeping a few of the remedies on hand, such as white diarrhea cure, which should be used in raising chicks in hot weather, not altogether as a cure, but as a preventive, given twice a week.

A good tonic or conditioner is also essential. Chicks get out of condition and need something to tone up their digestion.

Second week—Add a little finely chopped green onions and green alfalfa to the moist mash. This mash should now be made of two parts bran, one part shorts, handful each of meat scrap, ground bone, commercial chick feed, ground charcoal, chopped alfalfa and onions about 20 per cent. Slightly wet the green stuff and work the mash well into it. This should be fed twice daily, morning and noon. Keep dry mash before them and feed commercial chick feed twice daily, giving plenty at evening. Keep charcoal and grit before them at all times. Give fresh water at least three times a day.

Third week—Mash as above, adding more meat scraps and making the grain ration about half cracked corn and wheat with the commercial chick feed. Add more chopped alfalfa to the mash. If green alfalfa cannot be had for these mashes, scald alfalfa meal and let stand a few minutes, using same amount. Scatter all grain and chick feed in straw litter. Give enough at evening so they may scratch the balance up first thing in morning. When the chicks are four weeks old they should be well feathered and ready to remove to open-front houses and fed just about the same as for laying hens. Plenty of good, clean straw should be placed on the floor of the house four to six inches deep; if it contains grain, all the better.

For chicks of this age and younger I feed all mashes in open troughs about two inches deep, covered with inch mesh netting. Troughs should be 12 inches wide, about six feet long for 50 chickens. This allows plenty of room without crowding, which is very essential, else the smaller and weaker ones will be crowded and stunted.

From four weeks on I feed the following rations and have had extremely fine results with late-hatched chicks.

For morning and noon feed mash as follows: Equal parts bran and shorts, five per cent fish meal, five per cent beef scrap, five per cent rolled barley and cracked corn, little charcoal, half the above quantity of finely cut green alfalfa (or alfalfa meal scalded). Pour water on the cut alfalfa till thoroughly wet, then add all together and mix well, adding a little salt. Feed all they will eat twice daily. After a few days feeding this mash the chicks become very greedy and their appetites are enormous; you can see them grow day by day.

Feed grain at night.

This mash is extra good for laying hens and will keep them in prime condition. It is a cheap mash also, which adds to its value.

In conclusion I wish to mention a few facts over again, for sometimes we cannot have things impressed on our minds too often. First of all is this: In caring for and feeding chicks and hens, adopt some system best suited to what you have at hand and stay with it with regularity — don't change unless you do it gradually.

Don't feed your little chicks in a lot of dry dust and call it scratching material—or they will die sure—better wet the runs down daily—they will do better.

Try to teach them to go on the perches at six weeks and separate the sexes by eight weeks. Don't overcrowd. Crowding too many little chicks into a brooder or run in hot weather is very serious and the one thing above all else that must be avoided. This saps the very life from them and is the main cause of white diarrhoea and other diseases.

At from four to six weeks of age give chicks as much variety of feeds as possible, as they are very likely to have liver trouble if fed too heavy diet or one too rich in fat-producing elements. Give more greens, bran and bulky foods, and here is where a good tonic works wonders in the morning mash. They are now starting to grow their full coat of feathers and at the same time build up a strong growth of bone and muscle. This requires much discretion in handling. They must have an extra amount of feed and yet it must not be too rich or liver trouble will result. This applies to chicks kept in limited quarters; chicks on free range may be allowed to go to corn and wheat in sacks without danger, as they hunt their own variety as needed or relished.

Have raised late chicks every sea-

Cream Separator Manufacturers Say

that two-thirds of all complaints about cream separators are due to faulty lubrication. That is because the close-fitting, fast-running mechanism of the separator demands a special oil—and most people use "just any old oil."

Standard Hand Separator Oil

is made especially for cream separators and we know that it is "right" because our lubrication experts have made a study of separator construction and exactly adapted the oil to the requirements. It is just the right body. It doesn't "gum." Dealers everywhere.

son for a good many years and have had as good success as with the earlier broods. I have also watched results closely and have found that as a rule these later pullets lay more eggs in a year's time than very early pullets. Early pullets moult in the fall, shortening the laying period by at least two months; late pullets have a full year of laying before any moulting. There is another point or two in favor of later hatched chicks. They run largely to pullets, while early chicks run more to cockerels as a rule. Later hatched birds are truer tc color and shape. For instance, we take the White Wyandotte. Hatched early, it is liable to be too leggy, show more brassy, etc., while late-hatched birds are blocky, true Wyandotte type, and as a rule pure white and better layers, but not quite so large till after the moult the following year.

This is now June and my brooders have just been filled with chicks and they look very promising. By extreme watchfulness, scanty feeding for the first few days, spraying and disinfecting their quarters often, keeping their runs wet down during hottest days and attending closely to many other little details like scalding and cleaning fountains and troughs, keeping air-slacked lime sprinkled near feed troughs and fountains, dusting sulphur in feed troughs occasionally, etc., am expecting to produce some choice laying stock for next season.

It is somewhat uncomfortable and a little disagreeable to get out in this hot weather and look after chickens, but let us roll up our sleeves and bend one desperate effort to supply the demand for poultry and eggs.

Questions and Answers

THE EDITOR AND STAFF·

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Grasshopper Poison.

In the Cultivator of May 14, Mr. J. W. Mills writes on grasshopper control. I tried to dissolve the arsenic as he directs, using one pound white arsenic, one pound sal soda and five gallons water, boiling about 15 minutes, and there was a white sediment on the bottom. The water here is rather hard, perhaps I should have used more sal soda. I put the arsenic and soda in the cold water. Would be much obliged if you can help me out.—Subscriber, Woodland.

Boil the mixture for half an hour or more. There is always a little arsenic left in the bottom, and by draining off the liquid and boiling the settlings in fresh water with more lye, it can all be dissolved.—J. W. M.

Aloes for Squash Bugs

We notice inquiry regarding control of squash bugs in the last issue of the Cultivator. I find by dissolving aloes in wood alcohol until saturated, then reducing with water, say 12 quarts to one quart of the alcohol and aloes solution, and spraying any kind of vines it will drive the bugs away. It is especially effective for spraying corn just as the silk is starting. It will keep away the corn ear worm almost invariably.—L. L. Whiting, Winchester.

Stable Manure

Should stable manure be plowed under immediately after spreading or allowed to remain on top of the soil?—Subscriber, Baldwin Park.

Perhaps the ideal way would be the immediate plowing under, but in practice there are difficulties which might prevent and we do not think there would be any great loss, at least the loss would not be so great as if the manure were allowed to remain in a pile where it is liable to fire-fang and waste the nitrogen through evaporation. It is the general verdict that where spread over the surface and allowed to dry in the sun the waste is very slight.

Some Bugs

I am sending under other cover some bugs. What are they? I find them feeding on verbenas.—Subscriber, Santa Cruz.

Our Santa Cruz subscriber has unearthed a bug which seems to be a new one in this section. It has been submitted to various entomologists, the last word coming back from the state horticultural commission that these bugs were not yet named. They are long black beetles, somewhat similar to the common click beetle, but this they are not and we will continue the investigation until they are named.

Dexter Cattle

Where can I get information regarding Dexter cattle? This is the breed which was spoken of in the Cultivator of January 11, 1912.—Subscriber, Little Rock.

We believe there are no Dexters in California, but will ask our subscribers to give information as to any one who is breeding them.

Nematodes

A subscriber's request for information regarding nematodes and their control was referred to Mr. E. E. Thomas of the citrus experiment station, and he answers:

"At present there is no remedy known that will completely eradicate the citrus nematode, in fact that is the greatest problem before us and a large number of experiments are under way, the object of which is the eradication of this pest, but a sufficient length of time has not elapsed to draw conclusions as to the practical outcome. A few facts are known, however, which will help in its eradication. When a citrus tree is infested with the citrus nematode the whole root system may be attacked. This is quite possible from the fact that the citrus nematode has been found on citrus roots at a depth of 12 feet and if it is found at this depth there is no reason why it should not be found on the small rootlets of any other part of the root system. Owing to this fact, it is very hard to find a practical method for completely freeing the soil of the nematode, when once it is established on the citrus trees. All forms of the nematode, the egg, larva and adult are very quickly killed at a temperature of 140 degrees F. and if a large percentage of the infested soil should be heated to this temperature the number of nematodes would be greatly reduced. Carbon bisulphide might also be employed to reduce the number of this pest, but it is hardly possible that this method would completely eradicate them. Carbon bisulphide should be applied at the rate of from four to six ounces to the square yard of surface in six to nine holes per square yard. We hope to be able to give more information in regard to this subject in the future."

Tomatoes Dropping

What is the cause of tomato bloom falling? The vines are thrifty and have been in bloom for several weeks with but little fruit. — Subscriber, Dixon.

In California Experiment Station Bulletin No. 239, written by Stanley S. Rogers, this trouble is treated as follows: "Tomato growers are often troubled by the blossoms dropping from the vines, and, although the plants grow luxuriantly, very little fruit sets. This infertile condition of the blossoms is generally due either to unfavorable climatic conditions at the time the blossoms are forming, or to the character of the soil. Any weather condition, such as rain, cold or heavy fog, which interferes with the scattering of the pollen seriously affects the setting of the fruit. If the blossoms open during extremely hot, dry weather they are liable to burn. Another common cause for the failure to set fruit is an over-supply of nitrogen in the soil. This may be a natural condition, or may be due to heavy application of stable manure or commercial nitrogenous fertilizers. Over-irrigation when the blossoms are forming often causes them to drop. If unfavorable weather conditions cause the blossoms to fall, the time of planting might be changed. Unless the soil is very deficient in nitrogen it is generally better to apply stable manure at least one year before growing tomatoes. Soil which is naturally too rich in nitrogen for the fruit to set well should be avoided. Do not over-irrigate when the blossoms are opening."

Alfalfa Hay for Hogs

Have read a good deal about hogs thriving on alfalfa hay. My neighbors say that hogs will not eat hay of any kind. Can you tell me whether hogs will live and do well on alfalfa hay when other feed is short? Also, will you give me information about alfalfa meal? Is there a small mill in the market for making the meal?—Subscriber, Gilroy.

The inquirer's neighbors certainly have another long guess coming. Alfalfa hay is one of the best of hog feeds. Henry's Feeds and Feeding says: "Cottrell reports that brood sows which lived through the winter on alfalfa hay with no grain farrowed large, healthy litters of pigs in the spring. Numerous trials at the western stations have established the value and importance of a limited amount of alfalfa hay in the ration of fattening swine." Again, after giving a table showing gains of hogs fed on different rations we quote the following paragraph: "The table shows the great value for swine fattening of alfalfa hay when rightly combined with corn. When the ration consisted of one-fourth alfalfa hay, that amount of hay was worth its weight of cornmeal and was superior to the same weight of wheat bran. When alfalfa hay formed half the ration the returns were less satisfactory, showing that too much roughage was being fed. Ground alfalfa hay showed no superiority over cut hay. The farmer desirous of reducing the cost of producing pork should carefully study this experiment." Alfalfa meal does not increase the amount of nourishment in the hay, but does save the wastes, that is, the coarser parts which stock will often reject are made more digestible and more palatable. Small mills are manufactured for making alfalfa meal.

New and Second Hand
BUILDING MATERIAL

We sell cheaper than any one in Los Angeles. Let us prove it.

Iron enamel bath tubs complete with water overflow and 4½ Fuller combination	$15.50
Finest Grand Porcelain Lavatories, all designs and patterns	$3.75
California Paint, only per gallon	1.50
Shingle stain, per gallon	.50
Wall Board, send for sample; per sq. ft.	.02
Corrugated Iron, 26", 28 gauge, per hundred sq. ft.	3.65

New and 2nd hand Lumber of all kinds.

Mail orders given prompt attention. Estimates furnished on anything in the building material line.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Abscess

I have a colt three months old. About six weeks ago a swelling appeared on the outside of the right knee. It is about the size of a small teacup and is soft at the base like a windpuff. It don't seem to hurt him. I rubbed it with liniment, but it does no good. What is it and is there any cure?—Subscriber, Wasco.

It is probably one of those enlargements that is filled with serum and was caused by a bruise. If left it will become organized into a fibrous tumor that will be difficult to remove. The best treatment for such conditions is to make a large opening into it and dress the cavity with an antiseptic solution once a day until healed. Use bichloride of mercury, one part to 1000 of water and after washing out the cavity with it soak some surgeon's cotton with the solution and bind it on to the wound with a bandage. When healed it should be as good as ever. If you are not familiar with such things you had better get a veterinarian to do it for you.

Effect of Bee Stings

Will bee stings affect the flow of milk in a cow? I have a cow that was badly stung by bees nearly two months before she came fresh; so badly that it nearly killed her. For a month after she was fresh she gave a good flow of milk, but then commenced to gradually decrease and now, after another month, gives only about half the amount.—Subscriber, Ventura.

If she gave the usual amount of milk for a month after being fresh you cannot attribute the falling off now to the bee stings. It may be indigestion. Try giving her the following, which you can get of your druggist: Epsom salts, three pounds; common salt, one pound; bicarbonate of soda, half a pound, and nux vomica, four ounces. Mix and give a handful once a day. This should last at least three weeks.

Bloody Milk

I have a cow that has been milking for four months and now is giving about four gallons of milk a day. One of her teats gives bloody milk. This is not unusual at calving time, but should stop soon. Could it be a tubercle? The cow is in good shape and is on alfalfa pasture.—Subscriber, Wasco.

Yes, it may be a tubercle in the udder that is causing the bloody milk, but probably not, as the flow is keeping up so well. It might be well to have her tested for tuberculosis, but if she does not react, then would advise giving her the following: Epsom salts, two pounds; common salt, one pound; bicarbonate of soda, eight ounces and ground gentian, four ounces. Mix and give a handful once a day.

Arthur Shroeder, secretary of the San Mateo County Poultry Association, writes of the next quarterly meeting of that association which will be held at the Union Hotel, San Mateo on Tuesday, August 4, at 8 p. m.

MONEY MAKING LITTLE LINERS

In this department we will insert your advertisement under a classified head for 12 cents per line per issue. No ad accepted for less than 3 lines. Our classified columns are the clearing house for our many thousand readers.

MACHINERY

SECOND HAND WINDMILLS, TANKS, PIPE PUMPS ENGINES
RANCH AND POTATO MACHINERY

New 1000 gal. galzanized tanks, $13.50; 2000, $29.50; 8 ft. windmills, $29.50; 10 ft., $29.50; 12 ft., $45.00.

HAY MACHINERY

La Dow baler, $95.00; Whitman Power baler, binders, headers.

POTATO MACHINERY

Potato diggers, planters, cutters, cultivators, harrows, plows, Holt tractor, sprayers, sundries.

ENGINES AND PUMPS

Eight H. P. Stearns, $135.00; 20 H. P. Stearns, $195.00; 28 Lambert, $295.00; 35, $350.00; Ames double acting, deep well pump, $135.00; single acting pumps, $20.00 to $60.00. Centrifugal pumps half price.

SUNDRIES

Bankrupt sale new stocks and dies half price; gears, large pipe fittings, pulleys, belt.

HOW'S THIS?

Biggest little Pumping Outfit ever sold at the price, 2½ H. P. horizontal engine, upright jack and belt, new, $98.00. Capacity 1200 gallons, 100 feet. Demmitt Co., upstairs, 120 N. Main, Los Angeles.

We have pumps, motors and engines of all sizes and for all conditions, which we will sell or rent. If you want a complete plant or any part, write us your needs and get our prices. Can give you special low price on engine and automobile oil, also belting Machinery & Motor Exchange, 756-768 S. Alameda St., Los Angeles, Cal. Main 6382.

For Sale—Used and new gas engines, 2 H.p. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild gas engines correctly. Get our prices. Lloyd, 806 N. Main, Los Angeles.

LIVE STOCK

Ohio Improved Chester White (O. I. C.)—Four boars, March farrow left; 8 sows, June farrow, ready next month. Selected sows bred for October farrow; pigs ready to ship December 1st. Three herd boars in use. All stock cholera immune. Booking orders now. Crated and registered free. C. B. Cunningham, Mills, Sacramento County, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor, Mayhews, Sacramento Co., California.

Thoroughbred Berkshire Boars of all ages from developed and large-boned hogs. Riccomi Bros., Mountain View, Cal.

For Sale—Young, registered Berkshire boars; fine, strong stock, weighing about 150 lbs. Stanislaus Ranch Co., R.F.D. No. 1, Crows Landing, Calif.

Glenview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

TREES.

For Sale—One and two-year-old Washington Navels and Valencia Orange Trees. Eureka Lemons and Marsh seedless grapefruit, for Spring 1914 delivery. Write for prices, or call and examine stock at Morris Citrus Nurseries, Cor. Juanita and Valley Center, R. F. D., Box 34, San Dimas, Cal.

Now Is the Time to book your order for fig trees. "My specialty." $25,000. Seventeen varieties, extra fine, well rooted, straight and branched, one and two year old trees. Price list on application. C. C. Terbush, R. 2, Box 543, San Gabriel, Cal.

For Sale—50,000 Sour Orange seed bed stock, finest quality, or will let to responsible party on percentage basis; also 2000 A1 late Valencias, two years old next spring, or might exchange for Washington navels. H. H. Eshelman, Soldiers' Home, Cal.

The 1200-Acre Nursery, growers of 1500 varieties of trees and plants. OREGON NURSERY CO. Orenco, Oregon. Sales office, 522 Chamber Commerce, Los Angeles, Cal.

1000 Avocado Seedlings—Pots, also can furnish nice plants, bare root, at low price. A. A. Quint, R. D No. 2, Pasadena, Cal.

For Sale—Eureka Walnut Trees, budded on Native Black Walnuts. Choice stock. Order immediately. Don't delay. Wm. Holve, Fullerton, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

You Future Nurserymen—Write for prices on special stocks of plants to start business with. Ballou's Nursery, Pasadena, Cal.

Budded Citrus Trees and seedlings at fair prices. Will take auto or land. J. P. Butler, Jr., P. O. Box 145, Lamanda Park, Cal.

SEEDS AND PLANTS

Luther Burbank Spineless Cactus (Only)—Live stock fed on this velvet cactus, grow fat; hens lay more eggs, cows give more and better milk, and horses grow sleek. Why not get a start in the best, costs no more to raise than that which they call just as good. Ten slabs for $5.00, with one fine fruiting sort free. Address or call at H. L. Bauers' Cactus Nursery, 4401 Hammell St., Los Angeles.

$ $ $ SpineleSS CactuS. All varieties Burbank's fruiting and forage plants 10c up. Plant now. Black Bros.' Nursery, 455 Lucas, Los Angeles. $ $ $

All'gator Pear Plants—Choice Avocado Seedlings from Mexican highlands, two to three feet high. 1275 South Benton Way, Los Angeles, Cal.

Berry Plants and Rhubarb. My new Berry Book ready about October will be worth sending for. Louis F. Scribner, R. F. D., Pasadena, Cal.

Special Sale—Of 5000 fine hardy Burbank Forage Cactus at $150 per 1000, being half price. J. L. Atwater Nursery, R. 2, San Gabriel, Cal.

Thornless Cactus Slabs for sale at 5 to 15 cents each. Chas. R. Hanna, R. D. No. 3, Riverside, Cal

WANTED.

Wanted—A middle aged man and wife on a small ranch—man to milk two cows, have care of poultry and vegetables and help with a few hives of bees; woman to do the house work in family of two. No neighbors, schools or church—nearest town 15 miles distant. Dr. Harold Sidebotham, St. Ynez, Cal.

Wanted—Steady position by expert in pruning and new style budding and grafting; any kind of trees or roses. Work guaranteed. Mike Detore, 138 South Los Angeles St., Los Angeles, Cal.

Wanted—Active young woman to buy interest in poultry plant at Long Beach, and assist in management. Address Cultivator Box 99.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

RABBITS

New Zealand Reds, prize stock, young for sale; buy now and raise for the winter shows. Mrs. C. A Richey, R. F. D. 8, Box 557, Los Angeles.

BEES

We offer 200 colonies bees and fixtures with or without 5 acres land suitable for berries, poultry, etc. Cash or easy terms of payment. Will lease for several years with privilege to buy if satisfied. Particulars on request. Spencer Apiaries Co., Box 14, Nordhoff, Cal

FARM LANDS FOR SALE.

For Sale—Fifteen acres, two miles from Martinez, 26 miles from Oakland, opposite R. R. station, five minutes walk to school. [illegible] acres in fruit. Peaches, grapes, cots, cherries and almonds, balance truck garden. Alfalfa and hay, two wells, wind mill and two large water tanks. Water piped to house and chicken yard. Seven-room house, large barn, fruit packing shed, chicken houses, brooders, etc. Five hundred choice laying hens, [illegible] young chicks, 2 horses, 3 wagons, harness, farming vehicles, etc. Price, $8,000. This property is on main road, very conveniently situated to marketing and will increase in value; $5,000 cash, balance 7 per cent interest. Address R. C. Jones, R. F. D. No. 1, Box 35, Martinez, Cal.

For Sale—680 acres of land 40 miles from Los Angeles; Southern Pacific R. R. crosses a portion of the land; 150 acres under fence, 80 acres in crop this year, 10 acres in alfalfa; can cut from five to seven crops of alfalfa per year and will average better than one ton to the acre for each cutting; have had plenty of water on the surface up to the present time, and I have a good pumping plant that will furnish plenty of water at all times; have three good wells, house, barn and other out buildings. I will sell all or a part $25 per acre and up; one-half cash, balance 8 per cent for any reasonable time. Address J. E. Youngblood, Lang, Cal.

VICTORIA, AUSTRALIA, WANTS SETTLERS

Special inducements; government land, railways; free schools; cheap irrigation; 31 years to pay for farms adapted to alfalfa corn, grains, fruit, etc.; climate like California, ample markets; reduced passages, special excursion next November. Free particulars from F. T. A. FRICKE, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

For Sale—Twenty acres adjoining prosperous town, one water stock in Mutual Water Co. with each acre Conceded to be the best beet and alfalfa land in the state. About 600 feet from the station and beet dump. Five-year beet contract if desired. Price, $200. M. G. McNeely, Alpaugh, Tulare Co., Cal.

Florida Land—Three Months Free—Subscription to the Indian River Farmer. For truckers, fruit growers, citrus, general farmers and folks who want to know about Florida. Address INDIAN RIVER FARMER, Department X, Vero, Florida.

For Sale—Best paying alfalfa ranch in the beautiful Santa Clara Valley, one-half mile from R. R. station 18 acres alfalfa, 2 acres family orchard; beautiful residence, outhouses and irrigating plant. Address W. Kiely, Lawrence, Cal.

For Sale—Ten acres, fruit ranch, trees two and four years old; seven acres of apples and three acres peaches, cherries, pears, plums. Price $6,000, half cash, balance on time at 6 per cent. F. W. Duncombe, R. F. D. 1, Beaumont, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

Ranches, homes, acres, lots, exchange; send for free list. Wilson Bros., Santa Cruz.

POULTRY

CROLEY'S POULTRY CONDITION POWDER

is a wonderful help during the molt.

Try some. Your dealer has it.

How to Make Money—Mrs. A. Basley's latest Poultry Book is without exception the best ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1. Order from Cultivator Publishing Co.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., successors to Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

Barred Rock Cockerels (Hawkins' Royal Blue Strain) ready for fall mating. All the popular breeds of baby chicks every week after Aug. 15th. Order early and avoid the rush. Enoch Crews, R. 1, Santa Cruz, Cal.

Barred Rock and R. I. Red baby chicks. If you want to raise some broilers send me your order. Price $10.50 per 100 until September 15th. J. W. Lyon, Gardena, Cal.

White and Columbian Wyandottes, Light Brahmas and S. C. White Leghorns. Over 30 years a breeder. Stock and eggs for sale. Michael K. Boyer, Hammonton, New Jersey.

Barred Plymouth Rocks — "None better." Special prices for May and June. Write for 'em. C. H. Vodden, Los Gatos, Cal.

Trap-Nested White Leghorns—Bargains in Cockerels from heavy layers. Only $1. A. R. Schroeder, Box C, San Gregorio, Cal.

MISCELLANEOUS.

For Lease—Dairy ranch, 160 acres; 85 alfalfa, 35 grain, balance pasture with shade and firewood. Alfalfa and grain land all leveled and ditched, using wooden gates in ditches, also using 2200 feet 14-inch cement pipes. Ten H. P. motor, centrifugal pump, reservoir. Good six-room house, two sleeping porches, electric light, water piped. Tank house, garage, horse barn, and will build milking barn. Located six miles from Wasco, seven from McFarland, two from Elmo, 11 from Delano, Kern county. $1800 per year, tenant to pay power. Furnish references and security. W. F. Marks, 226 South Main St., Los Angeles, Cal.

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

A SOLAR FOOD CONSERVER

This inexpensive appliance intensifies the heat of the sun and uses it to sterilize and preserve fresh in every way, and to cure all kinds of deciduous fruits and vegetables. This invention opens a new home industry for making crystallized fruit confection for sale. Purchasers report having sold as high as $75.00 per month in this way. Write for prices and particulars to E. E. Dow & Co., Redlands, Cal.

FOR SALE
Perfectly equipped
propagating plant,
fine opening for an
all round man. Plenty
of deciduous and olive
budding.
Box 63, Rialto, Cal.

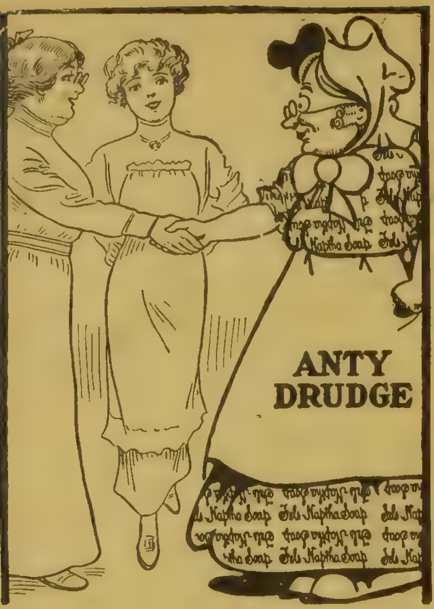
"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.



Mrs. Goodsense—"Anty Drudge, my daughter has told me how kind you've been to her, and I'm glad to meet you. When I go back to the city I'm going to see that all my friends use Fels - Naptha Soap. Mary thinks it's the grandest thing she ever used. She says it's the greatest help she ever had for all kinds of work, and the directions are so easy to follow."

If you are one of the women who *don't* know about Fels-Naptha Soap and the easy, quick way it will do your work, you'd better lose no time trying it. You'll find that it's the best soap for *every* purpose that you ever used.

It works best in cool or lukewarm water, and does scrubbing, dishwashing, housecleaning, even the weekly wash, in less than half the time and better than ever before.

Better buy it by the carton or box. Easy directions are on the Red and Green Wrapper.

Fels & Co., Philadelphia.

Household Department

SWEET TOOTH.

Sweet Tooth, silly youth,
Ate so many raisins and chocolate drops
That the wise world said,
As it shook its head,
"He'll turn to sugar before he stops."

Here a munch, there a crunch
He nibbled and nibbled, till sure enough,
Gradually—lo,
From top to toe
He stickily changed to candy stuff!

Cinnamon head, so it's said,
Marshmallow cheeks and peppermint nose,
Round sugar-plums
In place of thumbs,
Lollypop fingers and lollypop toes.

Sweet Tooth, horrified youth,
Wept that he wanted his diet plain;
So he fed and he fed
On milk and bread,
And turned to a natural boy again!
—Nancy Byrd Turner, in Youth's Companion.

MAKING JELLY AT OAK LODGE

By Mrs. Hilda B. Nielsen, Before State Fruit Growers' Convention at Davis

Having been brought up in a city, and like a city girl, I knew very little about ranching, but my husband and I both dreamed of owning a little home of our own, and we made that dream a reality as soon as possible, so that explains how we happened to buy our little ranch in the West Gold Ridge section of Sebastopol five years ago.

We chose virgin land for our new home, which meant slow progress, for every foot had to be cleared, but what pleasure we derived from planting our little home orchard and garden and putting up a few improvements as space permitted! We felt that the world was our very own.

Having both come from the city, we were very ignorant as to the quantity of berries that our family could consume. My father in the east had sent to us from a New York state nursery a box containing 1000 two-year-old currant bushes. When I received his message I wrote immediately for him to countermand the order, but it was too late as the bushes were on their way west. They arrived in excellent condition. After managing to sell a few and giving all of my friends as many as I could persuade them to take home, 700 currant bushes remained to be planted on our ranch. We hesitated about planting so many as we could not get any encouragement from the ranchers in this locality as to how the currants would grow in this section, but, rather than waste the bushes, we planted them all, and this was the foundation of our large currant patch and the beginning of my jelly industry.

After the second year I saw that we were going to have lots more currants than we could use ourselves, and as my husband hadn't planned on taking time to help harvest the crop I thought of making them into jelly and of trying to sell the jelly later, and it is because of my success in doing this that I want to tell other women of the state how they can do the same thing that I am doing.

I owe my success entirely to my method of making jelly, which I happened to get through our Ladies' Home Economics Club, which is studying agriculture and home economics under the extension department of the state college of agriculture. Our club had for study Bulletin 203 on "Canned Fruits, Preserves and Jellies," from the U. S. department of agriculture. We not only read Bulletin 203, but we studied the principles and rules underlying canning of all fruits. Never mind the recipes in the back part of the book, but study, paragraph by paragraph, sixteen pages of the bulletin. Then and only then try your preserving and jelly making, and you will be surprised to see how much more confidence you will have in the results.

Remember that Bulletin 203 may be had only by writing to your U. S. senator or representative and just asking for it. Don't hesitate to send at once for it. and then to study it when you do receive it.

I have made all kinds of jelly and canned various kinds of fruit and vegetables, but I shall only tell you how I make my currant jelly as that is my specialty, and the same methods are applicable to all kinds of jellies.

All fruits must be picked when not quite ripe to get the best grade of jelly, just before the pectin has turned into pectase. When this change has taken place, which happens when the fruit is ripe, many fruits refuse to jelly. Some fruits and berries will make jelly when just ripe, but will give a cloudy, dark colored jelly which has a very strong flavor.

I usually pick my currants in the afternoon and make the jelly the following morning. In the morning wash them thoroughly, let them drain well and put in a large pan which is covered. Allow the fruit to come to the boiling point slowly. I add no water whatever to any of my fruit or berries, simply allow the heat to bring out their own juice. When it is at the boiling point I remove from the stove and allow it to cool so that I can handle it easily.

I have used only my home kitchen and so have all of my housework to do. While the currants are gradually reaching the boiling point my housework is completed.

I put all of my fruits and berries, except plums, through the cider press to extract the juice. Small jelly presses are on the market for $4.50 and upwards, I believe. These can be used on the kitchen table, but the cider press does the work just as well. No matter how small an amount of jelly I am making I always put it through the cider press, as I find that I get all of the juice that way, and not a particle of pulp. I always put my fruit or berries in a large flour or sugar sack and fill the sack not any more than half full, tie the top securely, and then put my sack under the pressure.

While my currants are under the press I return and clean my kitchen thoroughly, which means that I make it as clean and sanitary as I possibly can.

My reason for doing this is to get rid of dust and bacteria that can easily lodge on the top of my jelly while it is cooling and later on, when the jelly is subject to the right conditions, will form mold or cause the jelly to ferment. I scrub the floor well, and then when it is all scrubbed and clean pour boiling water over the floor, so as to kill any germs which may have been carried into the house. I take a dampened, clean cloth and dust the room thoroughly. I then feel that my kitchen is clean enough to start to make my jelly.

The juice is then brought into the kitchen and poured through two flannel bags, one inside the other. These bags are suspended from a hook over my kitchen sink. The flannel seems to clarify the juice to a greater extent than any one would think it possible, had they not used the flannel bags previously.

The juice is weighed and for every pound of juice I add one pound of sugar. I never trust measuring.

I put the cold juice and the sugar on the stove and stir them well until the sugar is dissolved, let the juice come to a boil slowly and skim

it three times before it has reached the jelly period.

Meanwhile I have been cleaning and sterilizing my jelly glasses and have my jelly gauge ready for use.

My gauge is the only secret that I really feel I possess, and it's such a great secret that I'm ready to pass it on to every woman who makes jelly. For all the work up to this point is utterly wasted, to say nothing of the fruit and sugar, if the jelly is removed from the stove too soon, or if it is is left on too long, all of the work and care you have bestowed on it, or may bestow on it, is wasted, for the juice only reaches the jelly point once and only remains there for a moment, and if you are not fortunate enough to have watched it and found it at the exact time you can never bring it back again.

My jelly gauge or syrup hydrometer registers the percentage of sugar in the juice. Baume's hydrometer is the one commonly in use. A large glass cylinder must be used to pour the liquid jelly with, and the hydrometer is dropped into the boiling juice in the glass cylinder. When the large Baume scale registers 69 per cent you then have perfect jelly, or with the small scale 29 per cent is right. The instant the correct percentage is reached push the jelly to the back of the stove and fill your glasses as soon as possible.

Allow the jelly to cool and harden in the glasses, set in large pans or trays for convenience of handling. If any dust is apt to be raised in the room cover the jelly with two thicknesses of antiseptic gauze or a towel boiled and left in the sunshine for 24 hours previous. The dust spores or bacteria must not be allowed to settle on the newly made jelly.

The jelly must be covered and put away the following morning. I have used parowax, covering the jelly perfectly with it, but I think I prefer paper circles to fit the glass, dipped in grain alcohol and laid on top of the jelly. Then put on the tin tops, which should be completely sterilized by boiling for half an hour or more, and then drying in the oven.

Jellies should be kept in a cool, dry and dark place. About 60 degrees F. is preferable. If you think of starting jelly making see that you have your market. Then make the jelly, canned fruit, preserves, pickles or jams to fill your orders. Have neat little lists to send to prospective customers and state what you have for sale. Work slowly at first and your trade surely will increase.

I might add that out of my jelly, plum butter and mixed mustard pickles, which are my specialities, have come orders for fresh ranch eggs, which I send weekly to the city, and for dressed ranch hens and fryers, which I send by parcel post.

It seems to me that the market is unlimited, and that in supplying various fresh ranch products a large and new industry is open to the rural women of today.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle.

Breakfast

Fresh Berries Hominy
Broiled Ham French Toast
Coffee

Lunch or Supper

Cream of Asparagus Soup
Peppers Stuffed with Fish
Potato Croquettes
Watermelon Pickle Light Biscuit
Tea

Dinner

Potted Steak Corn Fritters
Fruit Salad
Blackberries with Cream
Fruit Macaroons Coffee

Potted Steak

Three pounds of round steak, six onions (medium size), one cupful of diced turnips, one cupful of tomato juice, two cupfuls of green peas, one teaspoonful of salt, one-eighth teaspoonful of pepper. Cut the steak in pieces suitable for serving, dip in flour and brown well in drippings. Add the onions, turnips, tomato juice and seasonings and barely cover with boiling water. Simmer until tender (about two and one-half hours), replenishing the water if necessary, and serve garnished with the peas.

Peppers Stuffed With Fish

Trim the stem ends of your green peppers so that they will stand up. Cut off the tips and, with a small sharp knife, extract the seeds and as much of the tough fiber as will come away. Mince white fish fine, moisten it with a white sauce, season and fill the peppers with this mixture. Put in the oven long enough to heat through and serve.

Cream of Asparagus Soup

One bunch of asparagus, one pint of water, two of milk, one slice of onion or a teaspoon of onion juice, two tablespoons of flour, two of butter and one teaspoon of salt. Cut the tender tips from the asparagus and throw them into cold water. Cut up the rest of it into small pieces and cook in a pint of water closely covered, for 30 minutes. Rub through a sieve and set the pan in another with water in it. Put the asparagus and the milk in this; cream the butter and flour together and add to them a little of the hot milk. Stir and rub till it is a paste, then add to the soup in the boiler and season. While the soup is making boil the tips of the asparagus in a little salted water, strain off the water and put them into the soup just before serving.

Fruit Macaroons

One-half cup chopped raisins, one-half cup chopped peanuts, one cup powdered sugar, one large tablespoon of flour and whites of two eggs; drop mixture on buttered paper and bake a light brown in a moderate oven.

The poor man today can buy the news of the whole world for a penny, which is something Caesar could not have done for his empire. As people were once poor, there is no poverty today.

Cook in a cool kitchen

A good oil stove will do away with the swelter and discomfort of a blazing hot range. Get an oil stove this summer and do your kitchen work in comfort. The

New Perfection
OIL COOK STOVE

does all that any wood or coal stove will do. It bakes, broils, roasts and toasts perfectly. The long chimneys concentrate the heat just under the utensils. It is not wasted or thrown out into the room. The New Perfection doesn't smoke or smell; doesn't taint the food. It burns kerosene, the clean, cheap fuel. Think of the comfort—no coal or wood to lug; no ashes to dirty the kitchen. Ask your dealer for the New Perfection.

HAY

Under date of July 25, Scott, Manger & Miller say:

We have received during the week ending today, 3100 tons of hay. In the various districts large offerings are freely made. Producers are endeavoring to make sales of round lots, but there has been comparatively little hay changing hands. Some of choice variety is in demand. There has been some hay moving for export account recently, which has been of advantage and has helped to work off a certain amount of stock. Alfalfa is in light demand. We quote the average wholesale prices on carload lots of new crop hay on today's market as follows:

Fancy Wheat Hay, lt. bales	11.00@12.00
No. 1 Wheat or Wheat and Oat	9.00@10.00
No. 2 Wheat or Wheat and Oat	7.00@8.50
Choice Tame Oat	10.00@11.00
Other Tame Oat	7.00@9.00
Barley	6.00@8.00
Wild Oat	6.00@8.00
Alfalfa	6.00@9.00
Stock Hay	4.50@5.00
Straw, new	.40@45

GRAIN

Citrus Fruit Market

LOS ANGELES, July 29, 1914.

The general condition of the orange market is good; it is very probable, however, that within a few days an easy condition will prevail. Shipments during the last week have been over 800 cars, while normal shipments should be closer to 500. The fruit is of such excellent quality that sales are satisfactory, which tends toward freer movement of the fruit.

The general condition on the lemon market is very satisfactory, that is, west of Chicago where California lemons are being placed. The market is shot to pieces in Atlantic coast points by the immense receipts of foreign fruit. Sixteen thousand boxes sold yesterday at $1.05. This gives the importer slight leeway to make any returns to the Mediterranean producer.

Shipments.

Shipments of oranges to date from Southern California since November 1, 1914: 33,394 cars; lemons, 2.410; total, 35,804. To same late last season: Oranges, 12,372 cars; lemons, 1,875; total, 14,247. Total shipment of all citrus fruits two years ago this date, 32,130.

NEW YORK, July 27.—Twenty-seven cars Valencias, two mixed cars sold. Market is strong on Valencias. Weather fair.

VALENCIAS—	Avge.
Queen Louise, fy, Louise Villa	$3.15
Queen Louise, ch, Louise Villa	3.00

CINCINNATI, July 27.—Hot. Sold ve cars oranges. Market is declinng.

ANOTHER CITRUS PEST

(Continued from Page 99.)

chedule A, and we may say that chedule A is three-fourths of the riginal Woglum schedule. Mr. Cuniff believes fully that with this chedule he will get good killing as ate as November or possibly December. The tents, being new, will be ept in good condition, fumigation oprations being directly under the suervision of Mr. Cundiff.

In addition to the five gangs, with ve men in each gang, which will do ork for orchardists, contractors will nter the field with their outfits and rosecute the work as rapidly as posible. Even under these circumtances it will be impossible to cover ll the orchards of Tulare County in he one season. However, there are any orchardists who will use the ld-time spray pump, thinking to get easonably good results by this methd. On this point we quote as follows om The Horticulturists Hand Book, ssued by Horticultural Commissioner William Wood of Los Angeles County:

"They seem to require fumigation somewhat earlier than the Black scale, say from July 15th to September 1st for the best results, and sprays have proved useless. There seems to be very little work of parasites on this scale."

But let me urge the growers to insist on strong dosage. In some southern orchards most unsatisfactory work was done last year. Some claim it was due to climatic conditions. But we note that practically all the fumigating done under the direction of the Los Angeles County Commission, as well as many other sections, was successful. Some independent contractors in the county, however, were warned by growers that any "burned' trees might result in suits for damages, and this naturally impelled the contractors to reduce the dosage to the minimum.

The Tulare County work will all be done with the tents, marked under the Morrill system, and by the use of the Woglum schedule or a modified form of it as stated above.

It will be impossible for all the trees to be fumigated and sprayed this year. The tents ordered by the county will cover only about one-tenth of the 15,000 acres. If contracting and cooperative fumigators should do an equal amount and sprayers much more, there would be still more than half of the infested orchards untreated. The worst infested will doubtless be done first, though so far as possible the "block system" will be followed.

The worst infestation is in one of the oldest orchards. The trees are almost touching each other and some are so badly infested that fruiting is stopped and the trees are a sticky mass of honeydew and smut. Dieback or many dead twigs are to be found in this orchard. As noted by Mr. Weldon the infestation is not in Tulare County alone, but in other northern sections, also in Southern California where it has been successfully fought for years.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Deed of Gift

Will you please tell me whether a a deed of gift is legal? I have been told that it casts a shade on the title and might make the property difficult to sell. Is that true?—Subscriber.

A deed of gift is legal and should cast no cloud on the title. It might, however, make the property difficult to sell under certain circumstances; for instance, a deed of gift made at a time when the grantor is insolvent and with intent to hinder, delay or defraud his creditors is void. A deed of gift might cause some to wonder if such circumstances did not exist and to hesitate on that account to purchase the property from the grantee in the deed of gift. If a title company will certify to the title in such a grantee, that ought to be sufficient to clear away any cloud. Again a deed of gift made by a married man of community property, if made to some one other than his wife, is void or voidable. Of course, if the wife joins in such a deed that cures any doubt upon that score.

Ownership of Water

A and B own a stream of water flowing through A's land. On A's land water rises ranging from 110 to 130 degrees F. By a decree of the court A owns without restriction all hot water, but the court does not define at what temperature it becomes hot water. Can A hold said water as hot water? Has A any legal right to change the natural course (on his own land) to separate the creek water from the spring water? Has he any right to pollute said water and allow it to flow into said stream when said stream is the only source for domestic water for several persons?—Subscriber, San Bernardino.

I would have to have the decree of court you mention to guide me before I could answer the first part of your question, and perhaps I could not answer it then without knowing all of the details of the case. As to the second part of your question, A has no right to change the natural course of the waters on his land, if, by so doing he causes them to flow on to his neighbor's land at a place different from that to which they would naturally flow, and if the change causes damage to the neighbor. A has no right to pollute the waters of the stream so that the pollution will damage the lower owners.

Marketing!!

That's the Problem

It matters little whether you have to sell a carload of corn-fed steers, or a bushel of onions, the problem is before you. And you must meet it. Here's a concrete illustration:

Why Is It So?

"When the farmers of Kansas are feeding Elberta peaches to their swine, rather than to haul them to a 15-cent market, the housewives of Chicago and the great Northwest are paying one dollar a peck, $3.50 a bushel, for the fruit."—A news item.

This absorbing problem was threshed out to exhaustion in the Great National Conference on "MARKETING and FARM CREDITS," held in Chicago in 1913. The ablest men in the World participated in the deliberations and discussions.

232 Solid Pages

The report of this week's work, reduced to the very quintessence of Argument, Reason and Conclusion, makes a book of 232 pages of rare merit. It is full of the "why" of marketing, and it is put in very readable form—so plain that any one may read it for entertainment. Richly printed; cloth bound.

Only 1000 Copies

left, while there are 1,000,000 farmers and economists in this country who need and really want them. Price is just $1.00, postage included. During the month of July, 1914, these desirable books go onto the Bargain Counter to our subscribers. New subscribers or renewals are treated alike.

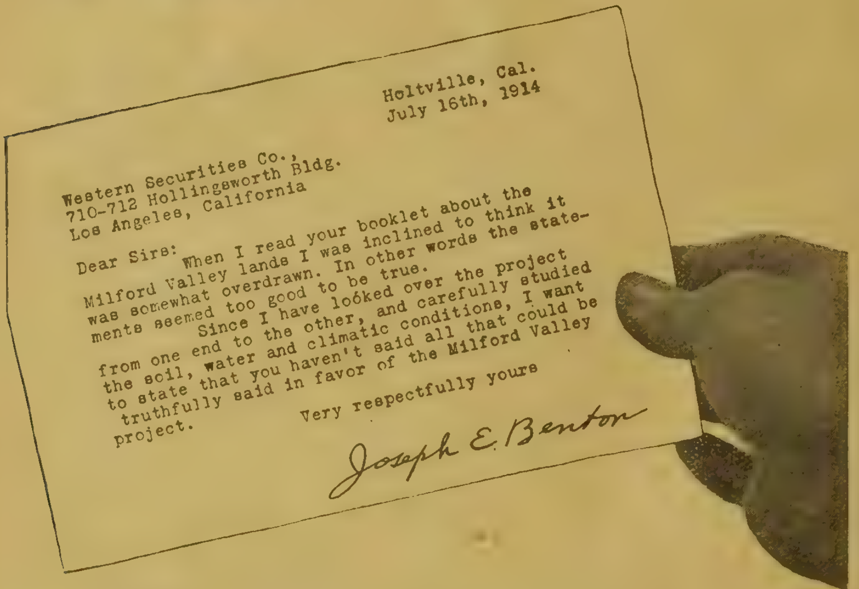
Address..

—he bought in Milford Valley and this is what he said!



Holtville, Cal.
July 16th, 1914

Western Securities Co.,
710-712 Hollingsworth Bldg.
Los Angeles, California

Dear Sirs:

When I read your booklet about the Milford Valley lands I was inclined to think it was somewhat overdrawn. In other words the statements seemed too good to be true.

Since I have looked over the project from one end to the other, and carefully studied the soil, water and climatic conditions, I want to state that you haven't said all that could be truthfully said in favor of the Milford Valley project.

Very respectfully yours

Joseph E. Benton

Mr. Benton's comments are almost identical with those of practically every man who has visited the Milford Valley irrigation project in the last eight weeks. No western farm land offering of the last ten years has met with greater approval and success than Milford. And no wonder! This land is being sold at $30 per acre, with a perpetual water right at $70 per share—the latter on twelve years' time, if desired.

When under cultivation and in alfalfa this land should sell within five years for more than $200 per acre—AND SHOULD ACTUALLY PAY FOR ITSELF TWICE OVER WITHIN THAT TIME. You can figure it out for yourself that this means not only more than 20 per cent annually on your investment, but the return of your original capital besides.

$30 An Acre

On Main Line of Salt Lake Railroad Adjoining Milford, Utah,

The older CULTIVATED LANDS in this district, EVEN 15 TO 30 MILES FROM THE RAILROAD, are held as high as $250 per acre and more. And the owners of these lands admit that the soil of the Milford project is as good or better. And our land IS RIGHT ON THE MAIN LINE OF THE SALT LAKE R. R. Practical, successful, keen-minded Southern California ranchers have purchased Milford Valley lands during the last eight weeks to the tune of over $250,000.00. There MUST be substantial reasons for this heavy sale. If you are in the market for something extraordinary priced away below actual value—make arrangements now to join our next excursion party at low homeseekers' rates. Go up and see why nine out of every ten buy this land at sight. Go and see the bumper crops of grain, alfalfa and fruit on lands adjoining the new project. Talk direct to the ranchers. Write for new illustrated booklet—also special article on Milford Valley in last issue of Western Empire magazine.

INVESTIGATE Our Money Saving —Money Back Plan, When Buying

BUILDING MATERIAL, PLUMBING SUPPLIES, Etc.

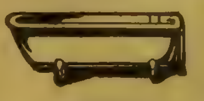
Do you realize what it means when an enormous concern of our size, always having the ready cash on hand, buys bankrupt stocks and also takes enormous quantities from the over-stocked manufacturers? If not, get in touch with us. Investigate our prices and quality of our merchandise. Clip out our money-saving coupon below. Mail it to us and receive one of our catalogs free. You will then appreciate the great savings we are offering on high class Building material.

Our Prices on Sash and Doors and Hardware are always the lowest

—ALL GRADES OF LUMBER—

Our prices on Lumber are at all times below market. Our quality is always up to standard. Let us prove this to you. Get our quotations. We furnish estimates free. We carry all grades of Redwood, Oregon and Sugar Pine, Shingles, Shakes and Laths. Our Mill is equipped with all modern and up-to-date machinery to turn out the finest workmanship in Finish Lumber. Our prompt Delivery System is for your convenience. One trial with us will make you a continuous customer.

PRICES SMASHED ON PLUMBING ! !



$8.00

Finest Galvanized 24-gauge Steel Bathtubs. Cannot be duplicated at this price. Also porcelain bathtubs of every description at $14.50 up.

We guarantee all bathtubs sold by us to be exactly as represented. Our Guarantee Tag goes with every one. If you are not satisfied with your purchase simply return to us and receive refund of full purchase price.

$3.75

Finest Grade Porcelain Lavatories. Every conceivable design and pattern. Write our Service Department if you are undecided as to what you want in Lavatories. Our department will advise you; other grades from —$4.25 up.

STANDARD BRAND PAINTS

Our Standard Brand of Paints is manufactured especially for us by one of the largest and best known manufacturers in the world. We absolutely guarantee it, both for durability and quality. It is strictly up to standard, and we also guarantee it to run true to color card and to be of uniform shade. We refund your money in full if you are dissatisfied. Color card sent free upon application.

"Standard" House and Floor Paints, per gal.	$1.50
"Standard" Porch Paint, per gal.	1.75

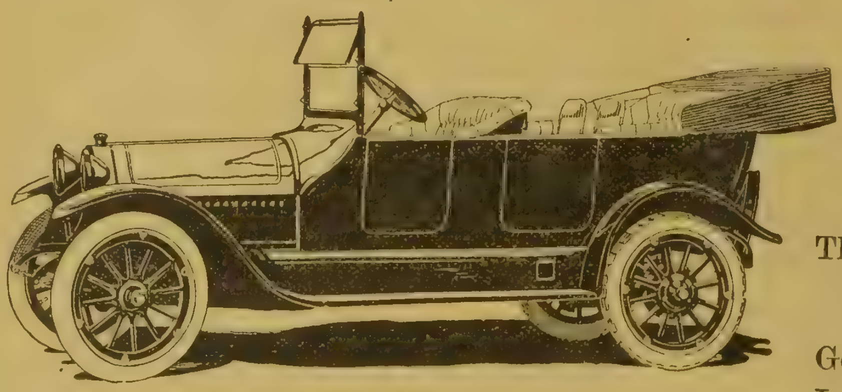
Feeding Cheap Alfalfa to High Priced Beef

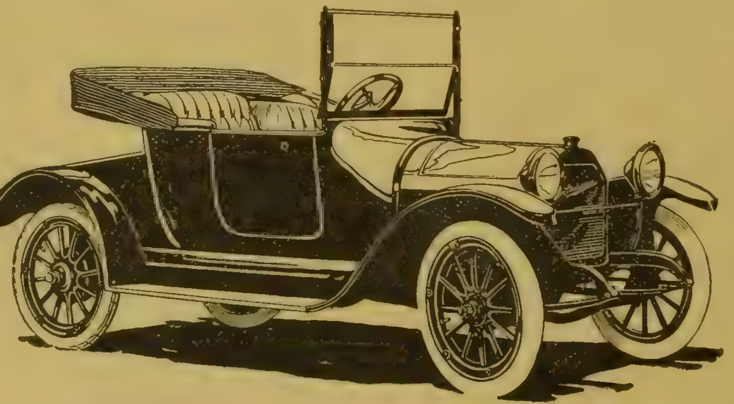
The Porterville Ranch Company Marketing its Alfalfa at Unsatisfactory Prices has Decided to Feed and Drive it to Market on the Hoof. The Manger in the Foreground Continues in the Far Distance Where the Faint Line of it May Be Seen Over the Load of Hay. It is Over Four Thousand Feet Long, Which Means Practically Four-fifths of a Mile.

The New Studebaker Automobiles



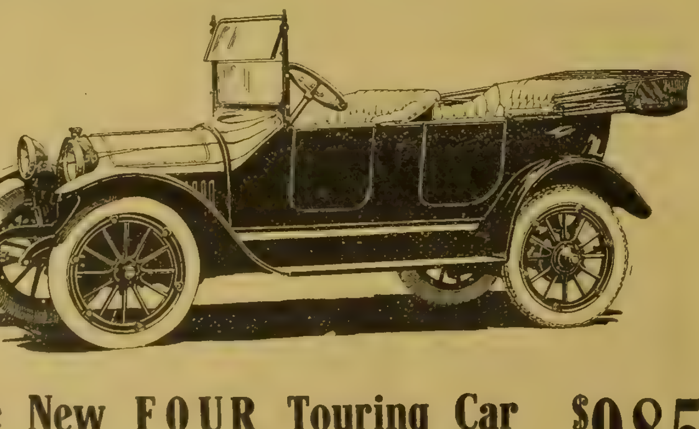
The New SIX—5-Passenger (7-Passenger $1450) $1385

Two body styles: Five-Passenger and Seven-Passenger Touring.
Wheelbase—121 inches.
Long-Stroke (5-inch), Small-Bore (3½ inch) Motor; Six Cylinders, en Bloc.
Smokeless, Non-Leaking Lubrication System.
Larger Valve Openings.
New, Exhaust-Silencing Muffler.
Annular Piston Rings.
Cellular Radiator.
Lighter Reciprocating Parts.
Crowned Fenders.
Lightened Clutch Operation.
150 Pounds Lighter.
15 x 2½ in. brakes.
34x4-in. Goodrich Tires on Q. D. Demountable Rims; Safety Tread on Rear.
Roomier Front and Rear Compartments.
Continuous Aluminum Footboard.
One-Man Type Top.
Built-in Rain and Clear Vision Ventilating Windshield. Attaching Rigidly to Top.
Scientific Anti-Rumble Gasoline Tank in Cowl.
Magnetic, Non-Leaking Gasoline Gauge, the only one Approved by Insurance Underwriters.
Full Floating Rear Axle, Shaft Locking into Taper at Hub.
Full Equipment of 13 Timken Roller Bearings.
Irreversible Steering.
Inter-Locking Ignition and Lighting Switches.
24 Finishing Operations in Painting Bodies Studebaker Blue.



The New FOUR Roadster $985

A three-seated roadster that actually seats three grown persons in perfect comfort. Driver's seat set slightly forward. A special top, baggage compartment at rear, etc. Same general specifications as FOUR Touring Car.



The New FOUR Touring Car $985

Two Body Styles: Five-Passenger Touring; Three-Passenger Roadster.
Wheelbase—108 inches.
Long-Stroke (5-inch), Small-Bore (3½-inch) Motor; Four-Cylinders, en Bloc, Exhaust, Manifold - Cast Separate.
Smokeless, Non-Leaking Lubrication System.
Larger Valve Openings.
Pressed Steel Push-Rods.
Annular Piston Rings.
Tubular Radiator with Auxiliary Water Tank.
Crowned Fenders.
Special, Dimming Headlights.
100 Pounds Lighter.
12 x 2½-in. Brakes.
Hot-jacketed Schebler Carburetor Bolted to Cylinders.
Magnetic, Non-Leaking Gasoline Gauge, the Only One Approved by Insurance Underwriters.
Generous Footroom in Both Compartments.
33 x 4-in. Goodrich Tires on Q. D. Demountable Rims; Safety Tread on Rear.
One-Man Type Top.
Built-in Rain and Clear Vision, Ventilating Windshield, Attaching Rigidly to Top.
Full Floating Rear Axle, Shaft Locking into Taper at Hub.
Full Equipment of 13 Timken Roller Bearings.
Irreversible Steering.
Flush Dash Equipment.
Extra Rim and Carrier.
24 Finishing Operations in Painting Bodies Studebaker Blue.

Manufactured Cars on Which You Pay Only One Profit

The Studebaker dealer in your nearest town now has on hand samples of the new Studebaker cars—FOUR and SIX.

Go to him. See the cars.

Inspect them point by point, and your knowledge of automobile construction will impress upon you the splendid safety, strength, stability and comfort of these cars, their fine finish, their generous room, and their complete and liberal equipment.

Through scientific, and up-to-date designing and motor refinements, these cars have power in excess of all requirements.

Remember, while you are making your inspection or taking your demonstration ride, that these cars are manufactured entirely—except tires, electrical equipment and a few minor items—by Studebaker, in Studebaker plants, and that no plant in the world is better equipped.

Remember also that their prices represent only one profit—the profit of the legitimate manufacturer who has eliminated the parts middleman from his business.

A motor car, to the farmer, is an economic necessity; not a luxury, as to the city man.

It saves his money; it saves his time; it helps him to get higher efficiency out of himself, his men and his land.

And it wipes out of his family forever the isolation and loneliness that are the dread of many farmers' wives, and that drive the boys and girls into the cities and towns early in life.

Just as the motor car is a good investment, so the Studebaker stands first in value among motor cars and we will tell you why.

For 65 years Studebaker has studied the farmers' needs, as a specialist in farm transportation, and the best way to supply them.

How well we have succeeded you can judge when you know that more than 40 per cent. of Studebaker cars are sold annually to farmers.

On Studebaker cars you pay only one profit, as we have said, and the money we save by our complete and thorough manufacturing and huge production goes into the cars themselves to make them better—

To make them last longer; to make them lighter yet stronger; to make them run farther on a gallon of gasoline and oil and on a set of tires.

One thing that adds excess value and life to a Studebaker car is the special steels we use, made to our own specifications especially for Studebaker cars.

Another is the scientific heat treatment of vital parts, like gears, axles, axle shafts, etc., which makes them stronger, longer-wearing, and permits lighter weight with increased strength.

A third is the absolute accuracy of our manufacturing processes, and the resulting perfect fit and alignment of parts, and perfect balance of the motor and the entire car, reducing friction and wear to the very lowest point.

Studebaker economy, in both FOUR and SIX, is known the land over.

Studebaker owners have found our cars peculiarly free from the necessity of repairs and frequent adjustment; all parts readily accessible and cared for with the least time and effort.

Ride in a Studebaker car—FOUR or SIX.

Note how it holds the road without weave or side-sway and know that this roadability is the direct result of Studebaker engineering and Studebaker complete manufacturing.

Equal economy, equal quality and equal roadability are not thus combined in any other "Four" or "Six."

Send for the Studebaker Proof Book which tells all about Studebaker manufacturing processes and illustrates them.

Vol. XLIII No. 6 LOS ANGELES: THURSDAY, AUGUST 6, 1914 One Dollar Yearly

Marketing Alfalfa on the Hoof

An Alfalfa Ranch in Tulare County Which is Solving the Cheap Hay Situation in a Most Sensible Way. Feeding the Beef in Corrals Almost a Mile Long.

The present season's oversupply of hay is putting hay producers to the test. Many will store and hold for more satisfactory prices, others will sell at present prices, and a few will secure good prices by feeding and marketing live stock. At least we think they will for we recently saw an experiment being carried on in Tulare County which looks good from the alfalfa producer's standpoint.

A few years ago the business men of Porterville, knowing of the exceptionally rich lands underlaid with water lying to the west of Porterville, and still within Tulare County, purchased a great body of it, sunk wells and proceeded to plant alfalfa. Water, soil and climatic conditions were almost perfectly adapted to the growth of alfalfa and good crops were the result. Ten tons was the return in the case of a few of the rich acres, others not so perfectly adapted ran five, six and seven tons per acre per year, the average amounting to considerably above seven tons. Up to the present year the handling of this rich property proved exceptionally profitable simply as a hay ranch. This year it is different, for while with the exceptionally cheap production it is possible to raise and dispose of the hay at this year's prices it is not profitable in comparison with former returns, so with the business foresight of the modern American farmer the company got busy. A string of corrals was built. These corrals, which are 100 by 208 feet in size, or approximately one-half acre each, make a string approximately 4000 feet long, or nearly four-fifths of a mile, and in them may be fed something over 1200 head of stock. The idea is to make each corral hold about 60 feeders secured from the ranges of New Mexico, Arizona or Mexico. At the time of the visit of the writer there were 641 head which had been in the corrals only a few days and they still were not over their surprise at the wonderfully rich feed they were receiving. So far only alfalfa is being fed. Some of this is from the stacks of cured hay, some is fresh cut green alfalfa direct from the fields. In addition, the finishing off will begin in a short time with a ration of rolled barley, seven to eight pounds to each animal daily, and, of course, alfalfa all the stock can eat, or at least 25 pounds per day per head. This is a year in which rolled barley may be had at a very reasonable price, and instead of storing and hauling to market it will be much cheaper to drive it to market in the form of high priced beef. It is assumed that from 60 to 90 days will be required to finish off the stock ready for the block.

As noted, the corrals are in one long string with a capacious manger running the entire length of one side and a lane along the other. The illustrations on cover page give an excellent idea of the arrangement. A roadway is being constructed along side the manger, and wagons directly from the stack or fields make the distance, filling with hay or grain. The arrangement of the lane on the other side of the corral is shown in one of the lower engravings also on cover page. As the gate swings open from the corral it closes the lane so that the stock are forced to go toward the exit. The method of gate construction is admirably shown, the "hinge" being the old time steel band around the upper part of the gate

(Continued on Page 135.)

Stocks for Fruit Trees

Address by U. P. Hedrick of New York Experiment Station, Before State Fruit Growers' Convention at Davis.

Nearly all fruit trees are consorts of two individuals. We distinguish the parts of the consorting tree as stock and scion—terms which need no definition. Fruit growers refuse to believe that the stock has any influence on the scion, at least the industry of growing fruit is carried on with little or no regard to the interactions of stock and scion. Yet there is no doubt but that stock and scion do react the one upon the other and that all fruits propagated by budding and grafting are influenced for better or worse by the stocks upon which they are worked. Experiments, experience and observation show that the physiological functions at least of both root and top are modified the one by the other. To this fact most of those who have given study to the question now agree, though they are not in accord as to the degree of the influence and the explanations offered by all are more or less hypothetical.

It is not a matter of wonder that fruit growers do not believe that the stock affects the scion, for we know little about it, and "nothing is so firmly believed as that which a man knoweth leath." Nowhere can one find clear cut definitions and careful analyses of the effects of the stock upon the scion. Everywhere there is much misconception and not a little deception in the use of stocks in the propagation of fruit trees so that fruit growers neither know what the best stock for a particular fruit is; or, if they do know, they cannot be sure that their trees are on the stocks of their choice. To complicate the situation further, results in the use of all stocks are profoundly modified by soil and climatic conditions, causing man to draw widely varying conclusions and more than all else bringing about the state of "confusion worse confounded" that we now have in the whole matter of stocks for fruits.

Were one to discuss the mutual influence of stock and scion in detail, citing examples of the manifold phases the subject assumes, he could easily fill a volume, a large one, and as interesting as large. In the time at my disposal, however, and for the topic under consideration, Stocks for Fruits, I can but briefly touch upon such parts of the subject as show the influence of the stock on the scion. Avoiding details and all taint of theory, let us consider the ways in which the stock influences the scion.

First, the stock modifies the form and stature of a plant. Pears on quince, apples on Doucin or Paradise roots, and cherries on the Mahaleb, are familiar examples of the dwarfing effects of stocks. Increased size less often, if ever, occurs. The altered size and forms of trees resulting from grafting cannot be said to be due wholly to diminished vigor and not at all to debility. Rather, the scion takes on the size, form and somewhat the peculiarities in habit of growth of the stock. Thus the scraggly Red Canada and Winter Nelis worked on Northern Spy, assume, somewhat, not wholly, Spy characteristics of growth; the pear on quince takes the size of the quince; the apple on Paradise or Doucin, the size and form of these stocks; a Montmorency cherry worked on a Mahaleb simulates the form of the Mahaleb; on a Mazzard, the form of the Mazzard.

Second—The adaptability of a species or a variety to a soil may be changed by the stock. Thus peaches when worked on plums may do well on heavy soils, where on their own roots they would be worthless. Conversely, the plum can be adapted to light soils by working on the peach, thriving still better on the Myrobalan in most soils. The almond is often preferable to the peach as a stock for peaches in irrigated lands. The Mahaleb is sometimes better than the Mazzard for cherries in shallow or in wet soils. These are but a few illustrations; many more might be cited if multiplication served a purpose. Possibly this is the most important of the favorable influences of the stock on the scion, for through it many fruits can be grown in unfavorable soils which would not thrive, in some cases would not live, on their own roots. The use of stocks to overcome adversities of soils, in my opinion, demands much more attention from fruit growers than it has had.

Third, through the stock a plant may be made to endure an incompatible climate. It would be quite too much to say that hardiness as an inherent quality is transmitted from the stock to the scion, but it is very certain that the increase in vigor imparted by some stocks to the scion gives greater hardiness to the grafted plant. In the case of late growing apples worked on Hibernal or Oldenburg stocks, greater hardiness results from the fact that the scion matures earlier than it would upon its own roots, and is thereby better able to withstand the winter. So too there is earlier ripening of wood and greater hardiness when the sweet orange is worked on the sour orange. Again, the slight obstructions to the flow of sap imposed more or less by the union of the different tissues of stock and scion may cause the scion to ripen earlier and thus bring about greater hardiness. Some plants, as the peach, must have a warm soil bottom heat, and therefore in cold climates the peach does better on the plum, which thrives in cold soils, than on its own roots. There are still other adaptations to climate for which we can offer no explanation.

Fourth, the stock, if diseased, may impart the disease to the scion. Such is the case when peach stocks infested with peach yellows or little peach are budded with healthy buds. The classical illustration of the conveyance of disease by grafting is that of variegation in foliage which usually passes from the scion to the stock. Variegation is a phenomenon possibly brought about by malnutrition, or, according to some, by the formation of some chemical substance which passes from scion to stock.

Fifth, the productiveness of the tree is often increased by the stock, paradoxically enough, either by increasing the vigor of the plant or by decreasing it. Trees sometimes fail to fruit well because of too much wood growth, in which case grafting on a less vigorous stock checks growth and makes the plant more productive; thus we may explain the greater fruitfulness of some dwarf apples and pears. On the other hand, a species or a variety may be too weak in growth to be fruitful, in which case grafting on a stock which imparts vigor may make them more productive.

Sixth, the time of maturity of both wood and crop may be changed somewhat by the stock, hastened on the one hand or retarded on the other, according as to whether the stock ripens earlier or later than the scion. It follows, of course, that the keeping quality is affected in the same degree as maturity. Thus, it is found that oranges on Trifoliata ripen earlier than on other stocks. The statement is common in literature that many late fruits budded on early ones ripen earlier and that some early fruits on late varieties, ripen later. It seems from what is known on this subject that we are warranted in saying that earliness is promoted in the scion, only however, when the stock ripens its wood earlier than the scion; lateness, when the wood ripens its wood later.

Seventh, the color of a fruit may be changed by the stock. There is little evidence to substantiate the claim often made that the characteristic color of a fruit is changed by the stock, but, as all know, color is heightened by earliness and lessened by lateness in the maturity of a vari-

Every Rancher should own a Western Gas Engine

The Small Bore Engine Of Highest Efficiency

Efficiency is what counts. That means light weight, reduced friction, simplicity, and above everything else, low operating cost. In demonstrating its reliability and its power, the **Western Gas Engine** has very forcibly proven that the small bore engine has the greatest efficiency and is the most economical. The World's leading gas engineers, without exception, agree that the **WESTERN** is correctly designed.

There is a certain type and size for your needs. Our Catalog gives complete information.

PUMPS

Whatever kind of a pump you need—we have it. Handling all styles of pumps we are not obliged to urge any one type on you, but are in a position to help you select the pump best adapted to your particular requirements. We manufacture and sell

Horizontal Centrifugal Pumps
Vertical Centrifugal Pumps
Deep Well Pumps, Power Heads
Windmill Pumps, House Pumps

Illustrated are three of the many different styles. Don't decide on a pump till you put your needs up to our Pump Specialists. Their advice and suggestions will cost you nothing.
WRITE TO US and state your requirements—by guiding you to a right selection we can probably save you both money and trouble.
FREE CATALOG 28-B describes Bean Horizontal and Vertical Centrifugal Pumps.
FREE CATALOG 28-D describes all other pumps; also Bean Distillate Engines.
A postal will bring either or both by return mail.

Citrus and Tropical Fruits

BROWN ROT GUMMOSIS OF CITRUS

Written for the California Cultivator

By H. S. Fawcett

Many questions are being asked by growers in regard to the nature of gum diseases and their treatment. Of the several different kinds of so-called gum diseases, the brown rot gummosis is perhaps the most common and most serious when all citrus regions of the state are considered.

These questions will be confined in this article principally to this form. Other forms, as scaly bark, etc., will be considered in later issues of this paper.

Question 1. Is the exuding of gum from a citrus tree always a sign of serious trouble?

No. Some forms of gumming are only, temporary and the tree soon overcomes them of itself. This is not true, however, of the brown rot gummosis, which is characterized by killing of areas of bark on the trunk clear through to the wood and the exudation of large quantities of gum. This form, if not checked, may in time kill all the bark at the base of the tree and cause its death.

Question 2. Is the gum the result or the cause of the diseease?

Merely the result. Many experiments have shown that in the brown rot gummosis the gum is merely the result not the cause of the dying of the bark. The bark first begins to be killed by the fungus, which is misroscopic, and the gum is only a product which the tree forms as a result. Attention therefore should be directed not so much to the gum as to the areas of killed bark where the fungus resides.

Question 3. What then is the cause?

Speaking only of brown rot gummosis, the causal agent is the invisible brown rot fungus (Pithiacystis citrophthora) which resides in the soil, (especially in heavy soils); the causal conditions are: excessively wet soil too high against the trunk, poor drainage, injuries to the base of the tree in digging around it in wet weather, etc.

Question 4. How should trees which begin to show brown rot gummosis be treated?

Use a sharp knife with a heavy blade. First determine to what extent the bark is killed to the wood in the vicinity of the exuding gum. Then cut all around the area about one-half to one inch into the live, unstained bark and a little farther at the top than at the sides, as the fungus usually extends faster upwards than in other directions. Then dissect out this entire area of bark that is killed to the wood and treat the wound and the entire trunk as well with Bordeaux paste. Experience seems to indicate that it is unnecessary to scrape the discolored wood.

Question 5. Is the further exuding of gum from the wound after cutting out the diseased bark and after the application of Bordeaux paste to be expected?

Yes, it is to be expected and need not cause any alarm unless more bark dies back on the edges. Considerable clear gum, especially from the upper edge, will form and run down over the edges of the wound. No attention need be paid to this gum except to examine the places at intervals of two or three weeks to see if any more bark is being killed. If the cutting was properly done at first, healing will begin to take place in a few weeks in spite of the gum all about the edges. The gum that runs down over the Bordeaux is free from infectious material. It will in time stop forming and fall away or be dissolved by the first rains. If any part of the margin of the wound dies further after treatment, that part only should be cut out further. No more bark should be cut off than is absolutely necessary to stop the progress of the fungus. Some trees have resistance enough when weather is dry to temporarily stop the progress of the fungus without aid, but it is usually unsafe to trust this natural resistance, if one wishes to avoid another outbreak the following spring.

Question 6. How would you prevent gummosis in planting a new lemon orchard?

On heavy soils I would plant only trees budded high (the higher the better, up to two feet or more) on sour orange stocks and avoid planting them too deep. Inoculation experiments have shown that to the brown rot fungus sour orange bark is most resistant, sweet orange somewhat less resistant and lemon bark very susceptible. Then after the trees had been set out for a year or two, I would protect the trunks with an application of Bordeaux paste in the fall before the rains begin.

Question 7. What is the formula and the instructions for making good Bordeaux paste?

A good formula for a small quantity is: One pound of blue stone (copper sulphate) dissolved in three quarts of water in a wooden, earthen or glass vessel; and two pounds unslaked lime slaked in three quarts of water in a separate vessel of any kind. When the lime is cool, stir the two together, making a slightly pasty light blue mixture. On a larger scale the formula would be 12 pounds of blue stone to eight gallons of water; and 24 pounds of lime to eight gallons of water. The blue stone is easiest dissolved by suspending it in a sack at the top of the water over night. If the blue stone is pulverized and suspended in warm water it dissolves rapidly. Good lime that is not air slaked should be used, and after slaking it with the water it should be allowed to cool before being used in making paste. If covered to avoid evaporation each ingredient will keep indefinitely, but after mixing the paste slowly deteriorates. Where it is being used over a number of days or weeks, just enough of the wet slaked lime and the blue stone solution should be mixed to make paste enough to last for one or two days, leaving the remainder unmixed in separate vessels. It may be applied with large brushes as is whitewash.

A number of lemon growers are using this mixture on the trunks of all the trees to prevent further infection. In situations where the soil is heavy and trees planted too deep or the bud unions on the lemon trees are too low and there is difficulty of controlling the moisture conditions about the trunk during the rainy season, the writer would suggest digging away the earth from about the base and painting the entire trunks from the first branches down over the bud union. If this is done in the fall before the rains begin it will tend to prevent any new cases the next spring and summer. Keep the earth from getting too high about the base of the tree, even though a small basin has to be left. Water standing temporarily in this basin after each rain will do less harm than the wet soil standing constantly against the trunk during periods of frequent rains. Where trees are mulched heavily this mixture would tend to prevent the damp mulch from encouraging brown rot gummois.

STOCKS FOR FRUIT TREES

(Continued from Page 123.)

ety. In the cases, then, in which the stock influences the time of maturity the color may be more or less changed. The speaker knows of an orchard of McIntosh apples which are grafted on Oldenburg, the fruits of which mature nearly two weeks earlier than McIntosh on standard stocks and are much higher in color.

Eighth, the size of a fruit is often increased by the stock. I need only cite the pear on the quince as an example though many other illustrations might be adduced.

Ninth, rather reluctantly, from my point of view, we must accept the testimony that the stock affects the flavor of the fruit borne on the scion. It is not hard to believe that larger, crisper, juicier fruits of a variety can be grown on some stocks than on others and that, therefore, the flavor is improved. But how a sour variety grafted on the stock of a sweet one, or the reverse, can change the degree of sweetness or sourness is past understanding, yet an abundance of evidence seems to prove such changes sometimes to be the case.

Tenth, some stocks shorten the life of the trees of which they are a part. Apples on pears and pears on apples are short-lived trees. Common pears, Pyrus communis, are short-lived on the Chinese pear, Pyrus sinensis. It may be laid down as a rule to which there are but few exceptions, that grafting a weak-growing species on a vigorous stock will result in a short-lived tree.

So far we have been discussing tree fruits. Much more is known about the influence of the stock on the scion in grape-growing, as you in Califorina with your reconstructed vineyards should know. To briefly epitomize: Experimenters hold, and I quote only from those of established reputation, that there are very appreciable differences to be noted between the chemical and physical composition of grapes grafted on various stocks and the fruit of vines on their own roots. Among the effects claimed for grafting, I note but do not vouch for the following: The fruit of the grafted vines is larger, has bigger seeds, thinner skin, the berries are less numerous, the juice is more copious, is usually both more acid and sugary, is less rich in phosphate, more highly charged with nitrogenous matters, has little tannin, less color, and the color is less stable; the vines are more fruitful; the fruit matures earlier. These differences vary in different cases. From the fact that the color is less stable and the proportion of the nitrogenous matters in the must is greater, the wines from grafted vines are said to mature more rapidly and are more sensible to injurious fermentations.

In an experiment with grape stock for American grapes, carried on for 11 years at the New York station, we found material differences between grafted and ungrafted vines, all included in the above summary.

There is no doubt, I must say in passing, that there is a reciprocal influence of the scion on the stock. We know certainly, for example, that the form of the roots is much changed by the scion. Thus, in starting apples in a nursery we graft or bud on seedlings which, ungrafted, would have root systems much the same, but at digging time the roots are as diverse as the varieties. Red Astrachan, for instance, has an exceedingly fibrous root system with few tap roots, while on either side of the Red Astrachan row Oldenburg and Fameuse are almost destitute of root fibers, having instead a deep tap-root and two or three prongs. So, with practically all fruits, though not as noticeable with any as in apples and pears. Nurserymen tell me the weaker the top-growth and the sparser the foliage of a variety, the more deficient is the root growth.

To the general rule that allied species grafted together retain their identity there are a few exceptions in which the scion acquires characters from the stock or the stock from the scion — the graft-hybrids of experimenters. There are on record a sufficient number of such hybrids, or pseudo-hybrids, to make out a case for hybridism through grafting. It would be interesting and profitable to consider in detail the several supposed graft-hybrids, but as none have practical value they are more suited to controversy than to real life—mentioned here simply to show the possible extremity of the mutual influence of the stock and graft.

What are the explanations for these various reciprocal effects of stock and scion? Plant physiology does not help us much in the elucidation of the influences of grafting. Theoretically, from the anatomy of plants, we can expect nothing more in grafting than the adhesion of the graft to the stock. The tissues below the union are those of the stock; above it, those of the scion. Yet there is some reason to suspect that definite substances pass from one to the other in the consorting parts of a grafted plant and produce specific results. Thus, as we have seen, when a scion with variegated foliage is grafted on a normal stock, shoots which spring from the stock below the graft are variegated. Or, if the deadly nightshade be grafted on a tomato, the poison, an alkaloid, atropine, passes down into the stem and root of the tomato. But, curiously enough, if the variegated plant or the nightshade be used as a stock, the variegation in the one case and the atropine in the other do not pass upward into the scion.

An ingenious and not at all improbable reason for some of the influence of the stock upon the scion was offered by a speaker in the French Academy of Science. He had made analyses of pear tree two years old from the graft on quince and pear stocks to determine the relative quantities of hydrocarbons stored in the stems of the two sets of plants. It was found that during the autumn and winter the reserve matter was markedly more abundant in the stem on quince stock. In the spring, therefore, the pear plant on quince is enabled to furnish a greater quantity of food matter, for the formation of fruit and crop production is greatly increased. Then again, the reserve food in the stem is nearer the fruit than in the root and is thus possibly more readily utilized. If these experiments are accurate we may find that the best stocks are those whose roots store the least quantity of reserve foods and so force the accumulation of reserve matter in stems.

Unquestionably some of the effects of stocks are due to altered nutrition, possibly to insufficient nutrition of stock or scion. All evidence points to the disturbance of nutrition as the chief cause of the effects of grafting. It may be that the food elaborated by the foilage of the scion is different from that which the stock would have had with its own foliage. It has been suggested that the differences in the specific quantity of the sap in stock and scion may be the disturbing factor.

But these explanations are not sufficient to cover all the phenomena arising from grafting. Truth is we have in the matter of grafting for most part only certain isolated facts to explain which we must rely, for the present, upon inferences which have the greatest amount of probability in their favor from the knowledge in hand. The poet says: "And still upon the thorniest stock, the sweetest roses love to blow." It remains for some one to tell us why.

Important though the effects of stocks as we have just discussed them are on the scion, any and all are but incidental to the true explanation for a two-part tree for practically all orchard plants. At the proper seasons in every nursery an army of expert workmen are found grafting or budding so dexterously, precisely and rapidly that their work is little short of marvelous. What are the reasons for all of this seemingly extra work of grafting? Why do not nurserymen sell us plants on their own roots? An intelligent body of fruit growers scarcely needs an answer to this question. You all know that in no other way can fruit trees true to name be propagated so rapidly. In some cases there is no other possible method of multiplying a variety. But unfortunately, the stocks chiefly chosen by nurserymen are those which can be worked most easily and soonest give a presentable nursery tree. The fruit grower in buying chooses a stock, if he gives the matter sufficient thought to make a choice, one that does not sucker, or one that best suits his soil, and in a few cases a stock that will give a dwarf tree. All other of the effects of the stock on the resulting tree are wholly ignored alike by nurseryman and fruit grower.

It does not follow, however, that whatsoever stock one wants can be used. Even when the botanical kinship is close some plants resist all of the appliances of art to make a successful union, while on the other hand there are quite distinct species of fruits that seem foreordained by heaven to be joined. Thus a pear will not grow well on an apple nor an apple on a pear, closely related though they are; but the pear readily unites with the quince or the hawthorn. So, too, the peach and the apricot are grafted on each other only with difficulty, but both readily unite with the almond and the plum. Sweet and sour cherries grow well on the Mahaleb cherry, but the Mahaleb will not grow on any of the cultivated cherries. Sour cherries upon sweet ones succeed less well than the latter on the former. The gooseberry will not grow on any of the edible currants, but thrives on the golden currant, Ribes auream. Something more is necessary, then, than botanical kinship, but just what no one knows, beyond, of course, the knowledge that there must be some conformity in habit between stock and scion; that the two must start in growth at approximately the same time, and that the tissues must be sufficiently alike that there be proper contact in the union. Yet these facts do not sufficiently explain the affinities and antipathies which plants show. Thus the propagator has little to guide him in selecting stocks and can choose only after making repeated trials, near relationship being the only guide, even though often an untrustworthy one.

Nor is the tale of tribulation yet told, for we shall find that not only are all grafted plants affected by the kind of stock used, but also by the manner of propagation, whether from seed or from cuttings. There is no question, for example, that stocks propagated by cuttings do not produce the deep tap and prong roots that seedlings do, and seedlings lifted and root-pruned the season before they are budded or grafted have a thicker and bushier root-system than if they be not so transplanted. And so, at the risk of stirring up more hares than we can possibly run down in this matter of stocks, it seems necessary to say that we cannot neglect for the best interests of fruit-growing the way in which stocks are grown. Undoubtedly for some conditions we shall find stocks from cuttings preferable; under others, and, generally, however, we shall find seedlings the better when, of course, we have a choice. So, too, usually, when nursery practice permits, a stock is better for having been transplanted before budding or grafting.

In passing it may be said that a retrospective glance in horticulture shows that the use of stocks for fruits and ornamentals is no new thing. The Latin poets, Cato, Columella, Virgil and Pliny could wield the grafting knife as well as the pen. It could be wished, however, that the statements of these old Romans were as accurate as the meter in their verse, for their inaccuracies prepared the ground for a crop of misunderstandings which even yet we are not rid of. It is probable that the Romans, and possibly the Greeks, propagated some fruits. The Romans certainly did roses, by grafting on stocks much as do our nurserymen today. The Paradise and Doucin stocks for dwarfing apples, dwarf pears on quince, the Mahaleb to dwarf cherries, all have been in common use in the Old World for several centuries as we learn from the old herbals. Shakespeare's familiar quotation:

"You see, sweet maid, we marry
A gentle scion to the wildest stock;
And make conceive a bark of baser
    kind,
By bud of nobler race; this is an
    art,
Which does mend nature; change it
    rather, but
The art itself is nature."

So much to show that we have the practice and experience of centuries to guide us in the matter of stocks,

CITRUS TREES

Buy from the largest Citrus Nurseries in the World

—and know what you are planting. Teague trees are better than others because scientifically grown. They are started right, grown right and shipped right. Ask for quotations.

We can supply all the STANDARD SORTS in almost any quantity—

ORANGES :: LEMONS
POMELOS

Teague trees are well rooted, strong and thrifty, free from scale, guaranteed true to name.

OUR BOOK "CITRUS FRUITS" — handsomely illustrated; a wealthy fund of accurate data —sent for 25c in stamps.

San Dimas Citrus Nurseries INC
ESTABLISHED 1890 BY R M TEAGUE
San Dimas, Cal. U.S.A.

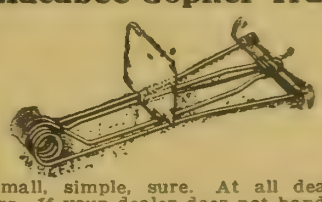
Perforated Tree Protector

The only Perforated Protector made; practically a small lath house about each tree, allowing the free circulation of air and mellowing the hot rays of the sun while giving perfect protection. No mouldy, smutty bark when using our wraps. WHEN DOES YOUR TREE NEED PROTECTION WORST? You know—while it is young and tender. Let us sell you Protectors. It's the best investment you can make after planting your trees. If your dealer hasn't them, send your order to us and we will fill it promptly.

Samples and prices furnished on application.

THE EXPAN CO., 935 E. Central Ave. Redlands, Cal.

Macabee Gopher Trap



Small, simple, sure. At all dealers. If your dealer does not handle it, send 20 cents in stamps and mention your dealer's name and get sample by mail postage paid. Write for prices in larger quantities delivered free by parcel post.

Mfg. by Z. A. MACABEE, Los Gatos, Cal.

SOMEBODY'S CHANCE

Six and one-half acres—2½ acres grapes, 2½ acres prunes, assorted fruits, 5-room house and bath, barn, windmill and tank, woodhouse, truck and buggy, road wagon, 5 poultry houses, 2 plows, 1 disc, 1 harrow, trays and boxes, prune dipper, 2 ladders and small cultivators. Price, $6000.00.

M. J. DUCHARM, Soda Spring Road, Napa, Cal.

though the accumulated wisdom seems to be of little present use.

The selection of stocks leads straight to the center of another problem. We are hearing much about the individuality of orchard trees and the necessity of propagating from individuals having the best characters. The speaker does not believe in the inheritance of acquired characters, finding but little in either theory or fact to substantiate it. Present knowledge makes more forceful every day the old aphorism, "Like begets like," "Race is everything," "A chip of the old block" and "Like father, like son." Heredity in the light of science is a tight compactment into which new characters seldom find a way. The multitude of trees in any variety, all from one seed, it seems paradoxical to say, are morphologically one individual. How, then, can the differences between individual plants in every orchard in the land be explained?

Ample explanation, it seems to me, is found in "nurture" without invoking a change in "nature" to account for the innumerable variations in orchards. Soil, sunlight, moisture, insects, disease and last but not least, the stock which supports the tree, these with many other factors, give every individual plant an environment of its own from which come characters which appear and disappear with the individual. Thus, I am sure, we can bend a variety by means of a stock, but I should be the last one in the world to hold that we could permanently mold it into any new form given it by a stock. Let go the force, whatever it may be, which temporarily bends a variety, and it snaps back into its same old self.

One more generalization and I am ready to conclude. In the refinement of fruit growing that is coming we must breed the stock as we now do the variety which it supports. The stocks of apples, pears, peaches, plums, cherries—all tree fruits—are supposed to be seedlings of wild species which we know vary much less than do seedlings of cultivated varieties. Yet it requires only a cursory investigation into the growing of nursery stock at home or abroad to find that apple and pear seed from the cider press and pits of stone fruits from canneries are commonly used in growing nursery stocks. Under present methods it is mere chance, a throw of the dice, as to whether one gets a tree on a good stock or a bad one. Would it not be a safe stroke of business for a nurseryman to select his stocks and through his catalog educate fruit growers as to the greater value of trees on selected stocks?

No one man's experience with stocks is sufficient to enable him to speak authoritatively on the subject, and in the present chaotic condition of our knowledge of stocks it would be a job for Job to start out and classify the contradictory opinions of the multitude who have expressed themselves on stocks in the horticultural literature of the past three or four centuries. The somewhat random and rather fragmentary thoughts which I have been able to give you may be summed up briefly for practical application as follows:

The future of fruit culture is bound up with the nature of the stock. The stock modifies the stature of plants; suits them to the soil and to the climate; influences fruitfulness; changes the time of maturity, size, color and flavor of the fruit; and affects the length of life of the trees. The stock, too, is influenced by the scion. The method of growing the stock, whether from cuttings or from seeds, is important. The effects of the stock on the scion, appreciable though they are, do not change the identity of a variety and are not heritable. If these arguments are well taken we can only conclude that fruit growers and nurserymen must give the question of stocks much more careful thought to the end, I am sure, that we shall thus secure more fruitful orchards.

FUMIGATION SUCCEEDING

Satisfactory reports come in from the Tulare and Fresno County citrus orchards as to the control of the Soft Gray Scale. The dosage schedule given in a recent Cultivator, however, is not the one in use, as by error it was handed to us instead of the correct one, which appears on another page of this issue. The error was caused by confusion regarding the sodium cyanide and potassium cyanide, which vary greatly in content of cyanogen. The corrected schedule may be counted upon to give a good kill and with careful handling do no injury to trees.

Allow us to repeat in order that we

(Continued on Page 143.)

Deciduous Fruit Culture

APRICOTS AND PEACHES

Written for the California Cultivator

By J. G. Berneike.

In order that I may not burden the columns of the Cultivator, allow me to state briefly just a few facts for the benefit of apricot and peach growers. Let them be wise.

The generally accepted estimate of the apricot crop for the state is 18,000 tons this year. The crop in 1912 was the largest with 20,000 tons. There was an idea current that the estimate for this year was too low, and eastern buyers were holding off partly because they thought prices might take a slump, since they had already eased off.

Much to the surprise of everyone here it turns out now that the crop in Orange County will fall considerably short of expectations, and this statement is based on deliveries made to the association packing house to date this year, compared with deliveries from the same orchards last year. The highest offer made here so far has been 9½ cents per pound for a fancy lot. The general offer now is 6½ to 8 cents. Some fruit has been sold at 8½ cents. There is but little buying and selling as yet.

The actual opening of the Panama canal will settle the question of freight rates. The realization of the fact that the crop is likely to be smaller than estimated will likewise settle an unfounded expectation of a slump in price. Association figures show an increase of only 12½ per cent over last year, instead of nearly 100 per cent as anticipated.

While apricot growers are holding firmly with the expectation of getting a living price, what about the peach growers?

Speculative buyers are selling the peach crop now at prices which will not pay expenses. They expect the growers to shoulder the loss. What will the growers do now? Pretty soon the speculator will knock at their doors to tell them what the market price is. What can the grower do? He can stand for a living price and turn the tables on the speculator, making him shoulder the loss. Will he be wise? Or will the peach grower be the only dull witted grower who cannot see through the wiles of the speculator, and unite with his neighbors to present a solid front? Since it costs the grower nearly five cents to produce a pound of dried peaches, less than five cents is not a living price.

CITRUS TREES FUMIGATED

GOOD, CLEAN, SOUND FRUIT in much GREATER ABUNDANCE than do UNFUMIGATED TREES

Use

CYANEGG
FOR
FUMIGATION
R&H C Co
TRADE MARK

Improved Form of

PURE (129%) SODIUM CYANIDE

- It is in 1-oz. pieces.
- It prevents waste.
- It generates uniformly.
- It saves money.
- It is free from "Fines."
- It is convenient to use.
- It does clean work.
- It saves time.

Because it generates evenly, little or no SULPHURIC ACID is carried out of the generator with the Hydrocyanic Acid Gas. Result—the practical elimination of burning and pitting of fruit.

The life of tents will be materially prolonged with the use of this material.

Practical field experiments have demonstrated its merits.

"Cyanegg" is the ideal material for use in the generation of Hydrocyanic Acid Gas, for fumigation operations.

F. W. BRAUN
Los Angeles
AGENT
THE ROESSLER & HASSLACHER CHEMICAL CO.

What a few prominently successful citrus fruit growers think of fumigation with hydrocyanic acid gas:

Mr. O. B. Griffin, assistant manager Leffingwell ranch, Whittier, Cal.:

"The fumigation of citrus trees is a profitable investment for the citrus fruit grower, and properly done will bring large returns."

Mr. McGill, manager McNally ranch, La Mirada:

"Correct and proper fumigation is the keystone in the structure of the citrus fruit industry. Without it there could be no profitable growing of citrus fruit."

Judge Erskine M. Ross, Los Angeles, Cal.:

"I have your letter of this date asking for a brief statement of my experience in respect to the advisability of fumigating citrus trees. As I have been a grower of such fruit for many years, I ought to know something not only of the advisability, but the absolute necessity of fumigation in localities where one's trees are subject to scale. I know from experience that a good crop of merchantable fruit cannot be produced on the same trees that produce a good crop of scale of any kind. I have, among other orchards, a good Valencia orchard of a fine quality of fruit. My failure to fumigate it three years ago caused me practically the loss of the crop of that orchard for two years; the income from which either year would have paid the cost of fumigation many times over. I did not fumigate it that year because those who examined it for the purpose, including myself, thought that it would go through that season without any substantial harm, without fumigation; but the scale multiplied so rapidly and so unexpectedly as to bring about the result above indicated."

Mr. Hemphill, manager for C. C. Chapman, Fullerton, Cal.:

"Correct fumigation spells clean trees, more and better fruit, highest prices in the market, and larger returns for the grower."

Mr. W. C. Hendricks, manager, Azusa Citrus Association, Azusa, Cal.:

"The cost of fumigating citrus trees should not be considered as a part of the expense account in the handling of a citrus grove, but rather as an investment that brings speedy and large returns on the money paid out."

Corona Lemon Co., Corona, Cal.:

"Replying to your inquiry, I did not suppose any California Citrus Grower in this day and age would doubt the absolute necessity of fumigation for scale. Any man who has scale and cannot fumigate should sell out as soon as possible, for there is no place for him in the business."

W. H. Jameson, Corona, Cal.:

"In reply to your favor of the 18th we have to say that we are strong believers in fumigation with Cyanide, as we consider it the most practical way to control the scale pest that has as yet been discovered.

"Whenever scale begins to make its appearance in orange or lemon trees here the grade of the fruit is lowered and if the scale is not cleaned up the trees begin to show the effects and the yield will surely be materially affected."

Mr. Pease, Horticultural Commissioner of San Bernardino, has knowledge of trees producing from four to six times more oranges and better fruit the first year following fumigation than they produced before fumigation.

Small Fruits and Vegetables

THIS MONTH IN THE SACRAMENTO VALLEY

Written for the California Cultivator

By S. S. Rogers.

Much of the land which was planted to early spring vegetables will during this month be ready for replanting to fall and winter crops. Where irrigation is practiced an application of well rotted manure should be put on at the rate of 15 or more tons per acre and spread evenly over the surface. This should be plowed under immediately to a depth of 10 or 12 inches, which should be sufficient to thoroughly cover it. The soil may be left in this rough condition or worked down and thoroughly irrigated as soon as possible in order to hasten the rotting of the manure. In a short time after the irrigation the field can be replowed and worked into condition for replanting. Where irrigation is not practiced it will be found more advantageous not to apply the manure until the winter rains have commenced. As soon as the field has been plowed after the irrigation it should be worked into a fine mulch as soon as possible and planted immediately, for it will lose moisture much more quickly during this month than at any other time of the year. The seed should be planted a little deeper than is desirable in the early spring.

In choosing the vegetables to be planted this month care should be used to select varieties which are fairly resistant to frost, for many will not mature until winter or early spring. The following list comprises some of the vegetables which can be safely planted in the Sacramento Valley during the month of August: Golden Wax and Canadian Wonder beans can be planted during the first week or 10 days of this month with a fair chance of securing a crop before the frosts come. The Golden Wax is a little more popular than the other variety. Cabbage seed can be planted this month or the plants set in the field. The Late Flat Dutch is the most popular variety, although the Sure Head and Winningstadt are used to some extent. Cauliflower plants can be set out this month or the seed planted. It is too late in the season to plant celery seed, but the plants may be set in the field. Many growers use the White Plume and Black varieties for the local trade and the Golden Self Blanching for shipping. If planted this month the first variety should be ready for the holiday trade, while the Black will not mature before spring. This latter variety will stand a low degree of temperature without serious injury, which makes it especially valuable for the spring market. Lettuce can be safely planted, and the Los Angeles variety will be found very satisfactory. Onion seed for the early spring crop should be planted in cold frames during this month. The plants will be ready to plant in the field during November and should mature a crop during May or June. The Italian Red is the most popular variety for this crop, although the Australian Brown is grown to some extent. Aside from the above mentioned vegetables the following can be planted during this month: Beets, carrots, parsnips, radishes and turnips.

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator

By O. M. Morris.

The list of vegetables which may be planted is almost as complete as the flower list. In fact, we may safely include in the list everything but melons and squash.

Potatoes for late crop are now being planted. These will be ready to harvest in about four months. Early potatoes do not keep through the summer, and it is always necessary to raise what we term a late crop for winter supply.

Peas planted now will be ready for use during the holiday season. Beans are also seasonable, and the Kentucky Wonder variety may be planted for a succession of crop. With the beginning of next month it would be advisable to plant bush beans. Probably the best of these for late planting is the Canadian Wonder, as it is more hardy and will stand cold weather. The winter or shipping crop of cabbage and cauliflower should be planted. This will be ready to harvest following the holidays, or even before. Large quantities of cabbage and cauliflower are shipped east every year, and it has proved a very profitable industry. Turnips and all the root crops may be planted, as well as stock beets for winter feed. These latter will help out materially during the late fall and winter seasons.

As a rule the month of August has found gardening operations rather at a standstill but there is no reason why most any of the crops should not be planted, provided sufficient water is given to put the ground in good condition before sowing the seed. With one or two irrigations following, this will give a crop of most any of the vegetables and they will thrive even better from this time on than during midsummer.

Plant onions for a winter crop. The early varieties should be chosen, such as White Queen, Mammoth Silver King, or Bermuda. These will be ready to harvest during February and March at a season when onions are always a good price. The White King will produce more quickly than any other variety. Planted in the usual way onions require four pounds of seed to the acre, and there is probably no crop raised that is more profitable, but they require close attention and considerable work.

GARDENING MANUAL

The Home Vegetable Garden, by Adolph Kruhm, published by Orange Judd Company, New York, $1 net. The Cultivator will be glad to secure the book for its subscribers at this price or, including a year's subscription to the Cultivator, at $1.85 postpaid.

The book is written for the eastern gardener largely, yet is filled with information for gardeners everywhere. The author is a gardener of long experience and he has many most practical hints for making and caring for the garden, especially as to securing largest returns. It is particularly valuable for the beginner and the small home gardener.

The following abridged table of contents suggests the completeness and practical value of the information contained: Location, Soil, Preparing the Ground, Spading or Plowng, Fixing the Planting Season, Putting Seeds in the Ground, Depth to Sow, Keeping Records, Successive Planting, Crop Rotation, Intensive Cultivation, Hotbed Construction and Various Classes of Garden Vegetables, with a Vegetable Planting Table. There is no detail overlooked, and yet the book is a model of conciseness, with all its information readily available. Beautifully printed on heavy wove paper, 24 full-page illustrations from photographs.

The Ornamental Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

It has frequently been said that Southern California has two seasons of springtime, the commencement of this month being the second spring or planting season. Everything in the list of flowers and vegetables which is timely for March planting is in season for planting during August. This applies to the entire list of perennials for spring flowering. If planted soon you will have strong plants for bedding in about three months.

Californians should feel especially called upon this year to plan ahead to make the state more beautiful than ever in order that we may hold our reputation as a floral state when our visitors come next spring. We want to keep them, or some of them, and every attraction will assist. The school children of the city have been enlisted to the number of 30,000, we are told, and prizes are being offered for best results. We should all get busy and work to beautify our city—and all of California.

Among the old-fashioned flowers which appeal to every one are the delphinium, snapdragon, campanula, hollyhock, gypsophila, Mexican and California poppies and petunias. Some of these have been so improved as to no longer be eligible to the "old-fashioned class." I lately saw several hundred plants of the Chateris hollyhock in full bloom which formed a most delightful picture. These are more dwarf than the older class and the flowers are much more compact on the stem. They are very large, double and crepe-like, and come in most delicate shades. Another splendid sight was a large bed of the new auriculate flowered Sweet William (Dianthus barbatus hybrida). This is strictly a novelty of great merit. Heretofore this class has required two seasons to come into bloom, but hybrid seed planted last April is now in its full glory, commencing to bloom in three months from planting. The flowers are larger and more diversified in form and color than the old kinds, some of the individual blossoms measuring one and one-half inches across, and the heads six to eight inches, with splendid stems. As a rule the head is less compact than the old type. It shows its parentage very strikingly, Dianthus Barbatus x D. Laciniatus.

This is the particular time to plant stocks, pansies, annual phlox, calliopsis, gaillardia, snapdragon, calendulas, candytuft, centaureas, cosmos dianthus, poppies, gypsophila, mignonette, forget-me-not, salpiglossis, schizanthus, scabiosa and the winter flowering sweet peas. This list does not cover all, but the leading items that are in season.

Care should be taken in preparing the pansy bed to have it well shaded from the sun at this time. The best results are obtained by selecting a small bed in the garden and making a frame six inches by one foot deep, and after seeds are planted, cover with burlap or good muslin and keep well watered. The other varieties mentioned do not require so much care, but a little shade of brush or a coarse straw mulch would be advisable, as the ground dries so quickly, and if freely watered the bed is apt to crust over and prevent the plants from coming through. Small branches with the leaves on are fine for this purpose.

ATTRACTIVENESS OF THE COUNTRY HOME

Here are some sentiments taken from recent publications which express the lure of the country for the boy or girl who is so fortunate as to live within reach of country sights and sounds.

"A child whose early years are spent largely in the country will fondly remember his youth and his beloved animal companions, for country life for a child is rich with happy associations, while the youth of a child kept constantly in the city is a starved sort of a thing."

"When we say widen the outlook for the boys and girls we do not mean, that they must go away from home to find the world. If you will just show them that the world is right under their feet and over their heads, and that they have all the science right at hand, and all the arts for that matter, they will not wander from home. Still it is necessary to furnish them intellectual tools and stimulus in the way of books and magazines. Unfortunately, most of our country homes have only those papers that give a questionable lot of passing information."

"A country cannot hope for agricultural prosperity unless the face of the youth of the land is turned toward her fields and meadows, and the boy of this country, alert, eager, questioning, will face the direction of most vital interest—the city, if it offers the greater thrill and opportunity—or the country, if it beckons with big enough call to the pulse of the youth. But the appeal has got to be geunine; it has got to flount a banner and stir the blood and promise some sort of a tangible victory.

Now is the time to consider the plans for making the surroundings of the country home attractive, that environment may exert its strong influence in the right direction. The tin cans and other unsightly accumulations of rubbish should not be a part of the memory of home which any child carries into adult life. A few seeds of vines planted where needed will make a thing of beauty of some ugly object which cannot well be removed, and "a thing of beauty is a joy forever."

This is a practical phase of home life which should not be crowded aside for what may seem to be more immediately remunerative interests. Make home surroundings attractive and beautiful and so increase the hold of the country home on the young folks.—Virginia H. Corbett, Colorado Experiment Station.

Do not plant shade-trees too near the house. Give the air a chance to circulate round and through the house. Set the trees so as to shade windows during the hottest hours, if you want them shaded, but never close enough to prevent the air from entering the windows freely.

The blooming season of almost all annuals may be greatly prolonged, not only by picking off the seed heads, but by cutting back severely, the entire plant, which will, except in a season of severe drouth, make a fine, new growth and blossom profusely. This is especially true of the cornflowers or bachelor buttons, marigolds, larkspurs, and candytuft, and also of those general favorites, the nasturtiums, or tropaeolums, not, however, taking off the central stalks of these, but picking closely every day to prevent the formation of seed.

Asters unquestionably take rank as the finest of midsummer annuals, and their development and training will amply repay any extra care that may be bestowed. They do not thrive in stiff clay soils, and before sowing the seed or transferring from the hotbed the border designed for them should have a specially prepared soil of loam, rich compost and sand.

Do not plant flower-plants too close together. Verbenas should be at least 18 inches apart; petunias the same; phlox a foot; balsams a foot; pansies 10 inches; zinnias 18 inches; marigold two feet; poppies 10 inches. If flowers are too close in the bed they will not make as thrifty a growth nor will the flowers be as large and plentiful.

If the lawn is a little bumpy, fill the depressions a little at a time with a fine garden soil. Put half an inch of soil on at a time and let the grass grow through it before putting on any more. In this way a lawn can be made smooth in the course of a season or two without being torn up and lying bare for months.

Keep flower beds out of the center of the lawn. They show with better effect if used as borders for walks and around the sides of the lawn.

Do you want a soft, thick turf on your lawn? If so, mow it often and let the clippings lie where they fall. They will soon settle in the grass and after a while they will make a soft cushiony coat, which keeps the soil from drying out too much and fertilizes it as they decay.

BANKING BY MAIL

Has become a common business practice.

The various departments of the SECURITY have planned to facilitate mail transactions.

Attention to financial matters is made easy for those living at a distance.

Many of our 88,000 depositors do all their banking business by mail.

Mail deposits are promptly acknowledged, and receive the same careful attention as those made by a depositor in person.

Four per cent on Term Savings Accounts.

Write for full information regarding Banking by Mail.

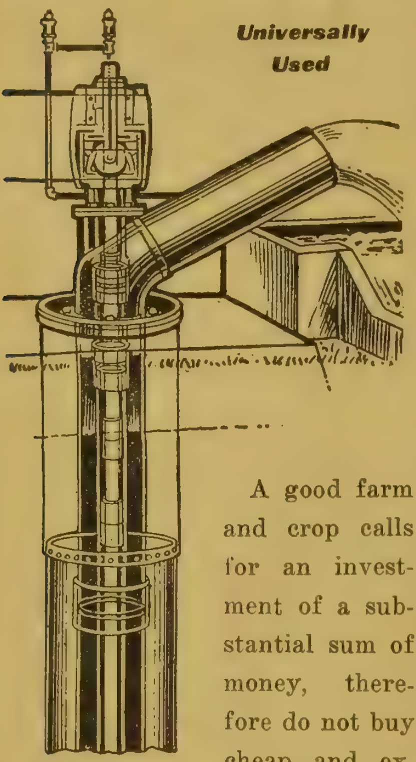
Two Great Factors in Water Development

Layne & Bowler Pump and Screen

Universally Used



A good farm and crop calls for an investment of a substantial sum of money, therefore do not buy cheap and experimental machinery.

For over 10 years the Layne & Bowler pump and patent well screen have been the most prominent factors in the development of water, and have been the choice of the most up-to-date irrigators.

Water with this great system is always available, and produced at the very lowest cost.

"Let the World's Largest Water Developers Solve Your Pumping Problems."

Our Illustrated Catalog No. 30 tells all about this pump and screen. It also gives valuable irrigating information. Write today for it.

THE WALNUT PROTECTIVE LEAGUE

On June 18 a representative meeting of walnut growers and shippers was held at 313 Fay building, Los Angeles, for the purpose of discussing the advisability of forming a walnut league which would be representative of the entire industry in California, and after a lengthy discussion, the following resolutions were adopted:

Resolved, That is is the sense of this meeting, after careful consideration, that the walnut growers, shippers and persons interested in the walnut industry, do forthwith proceed to form a voluntary, unincorporated organization to be named "Walnut Protective League."

Resolved, That the secretary, in conference with Mr. Farrand, reduce to writing the plan outlined and agreed upon by the meeting today and cause the same to be submitted to the various growers, shippers and others interested in the walnut industry, a general outline of the proposed plan to be so submitted, to be substantially as follows:

1. That the name of the organization shall be "Walnut Protective League."

2. That the purpose for which the league is formed is to handle all general questions which affect the walnut industry at large, such as legislation, state and federal, transportation, and any and all other questions affecting the upbuilding and protecting of the walnut industry, but without reference to and excepting the various methods of marketing.

3. That membership in the Walnut Protective League shall be entirely voluntary and all growers, organizations of growers, or shippers of walnuts, are eligible to membership in the league, and all such persons are urged to identify themselves with and to become members of the league for the purpose of aiding in the accomplishment of its purposes and to participate in the benefits to be derived from its formation.

4. That funds for carrying on the business of the league shall be raised by general assessment upon the nuts shipped by its members, such assessments as may be necessary to be made from time to time by the executive committee of the league which is to be provided for, provided that no one assessment exceed one cent per hundred pounds upon the basis of walnuts shipped by each member during the past season.

5. That during the year 1914, a membership fee shall be charged each member joining the league, of one cent per 100 pounds on shipments made during the shipping season of 1914, payable to the league not later than January 1, 1915. After the year 1914 the membership fee shall be ten cents per ton on shipments made by the member joining, during the season immediately preceeding his becoming a member.

6. That the affairs of the league shall be handled by an administrative committee and by an executive committee to be selected by the members of the league, which committees shall have such power and authority as the members themselves shall determine.

7. That the members of the league shall provide for the election of a president and vice-president, a secretary, and a treasurer, and shall prescribe their qualifications, the president and the vice-president to be members of the executive committee; compensation, if any, for all officers and employes of the league to be fixed and determined by the executive committee.

8. That membership in the league may be cancelled at any time by any member by filing with the executive committee of the league, notice in writing of his resignation or withdrawal.

Be it further resolved, that the secretary of this meeting be instructed to circularize prospective members, furnishing them copies of the proposed plan of organization, and if deemed advisable to call personally on any or all such prospective members to solicit them to become members of the league.

Further resolved that when this meeting adjourns it adjourn subject to the call of the chairman who is authorized to fix the time and the place of holding a meeting of all persons desirous of becoming members of the league upon the plan outlined.

There seems a great need for a closer union amongst those interested in the walnut industry in California at this particular time. Legislation is now pending, which if not combated will greatly increase the cost of production, harvesting, packing and shipping of walnuts, including the probability of an advance in freight rates. Every person in any way interested in the producing, packing or shipping of walnuts should be vitally interested in the work that the proposed Walnut Protective League will undertake. The proposed eight-hour law, as previously advised you, will work untold hardship to the walnut grower and packer as will also the minimum wage scale of $2.50 per day of eight hours. It is of the utmost importance that we have the help of the entire industry at this particular time in order to fight this adverse legislation. Money is not the only thing that is necessary. Of as much importance is the moral effect that such a league would have in appearing before legislative bodies. It is a well known fact that no one shipper can go before such legislative bodies and present such problems affecting the industry generally, and receive anywhere near the amount of consideration as could the representatives of the league, where it could be shown that practically the entire industry was represented by the organization. We must have a strong union embracing the whole industry to forcibly present the growers' side of these various problems.

The cost of membership in the league, as you will note, will be a very small item. It is doubtful if an assessment of over one cent per 100 pounds of nuts shipped will ever be levied during a single year. Undoubtly there will be years when assessments will be skipped altogether, and in comparison to the work the league can do, this cost is infinitesimal.

It might be well here to review a few of the accomplishments of the Citrus Protective League, a similar organization handling the general problems which confront the citrus industry. This league was organized eight years ago. They have never made a single assessment of over 25 cents per carload on fruit shipped by their members.

The first great work of the Citrus Protective League was their successful efforts in reducing the railroad rates on oranges from $1.25 to $1.15 per 100 pounds. This was accomplished in February, 1907. Since that date this saving of 10 cents per 100 pounds has amounted to $6,172.000 to the citrus industry, and at the present rate of shipment is saving the growers about a million dollars annually. The ruling they secured regarding refrigeration of citrus fruits is saving the industry $50,000 annually.

It was directly through the efforts of the Citrus Protective League that the lemon rate case was fought to a successful conclusion whereby the rate on lemons was reduced from $1.15 a 100 pounds to $1.00. This reduction is saving the lemon growers a quarter of a million dollars annually, and the railroads have had to refund as excess charges to the growers, approximately $845,000 as a consequence of the successful fight made by their protective league.

The Citrus Protective League also carried on a great fight against reductions in the tariff in face of an organized effort on the part of the New York importers to put citrus fruits on the free list. The league was successful in having retained a half cent a pound duty on lemons and oranges.

The Citrus Protective League has also done a great deal of good for the industry in such matters as securing from the state and federal governments the assistance of the highest class of experts to make investigations and reports as to the proper methods of growing, shipping and packing citrus fruits and in quarantine legislation and in securing experts to combat their fungus diseases and other pest problems. They have also done a great deal in frost protection work.

The total cost of maintaining the Citrus Protective League during the eight years it has been organized has averaged 60 cents per car per year upon the shipments of its members. This represents approximately 1½ mills per box and has been the means of saving to the orange growers in freight alone 7.2 cents per box and to the lemon growers 12.6 cents per box in the last few years. This to say nothing of the general benefit to the industry as a result of their many other fights and investigations.

There is absolutely no reason why the walnut men cannot organize as effectually as have the citrus men. A world of good can be done which will be of equal benefit to all concerned in the walnut business, whether they be independent growers, shippers or associations. It is therefore to be hoped that a general response may be had to this urgent call.

While the members of the California Walnut Growers Association are shipping a majority of the California walnut crop, it has been the expressed desire of the officers and a majority of the directors of the California Walnut Growers Association that the league be controlled outside of the California Walnut Growers Association. This is the policy which has been adopted by the Citrus Protective League, as their president, vice-president and several members of their executive committee are not members of the California Fruit Growers Exchange, and this same policy will undoubtedly be followed in the organization of the Walnut Protective League.

As soon as sufficient applications (form of which is given below) are signed to assure the league success, a meeting will be called for the purpose of electing permanent officers and members of the various committees, and, while you will note that no membership fees are payable until January 1st, 1915, funds have been arranged for, for the fight that must be promptly undertaken in order to defeat the eight hour law and minimum wage scale in the coming election.

* * *

The undersigned hereby agrees to become a member of Walnut Protective League in accordance with the above outline and to pay the membership fee and assessments as therein provided, so long as he will remain a member of such league. Dated..............

8 Hour Resolutions

These are "For Sure" Resolutions this Time and from the Morgan Hill Farmers Union.

We gave at one time "resolutions" which were not resolved by the Rucker Farmers' Union, though we thought they were when sent to us. They were simply "resolutions for discussion," but not endorsed by the membership. Now, however, comes a series of resolutions passed by the Morgan Hill branch of the Farmers' Union:

"Whereas, The basis of all prosperity rests with the productivity per acre; and

"Whereas, The industrial advancement of the people as well as the wealth and prosperity of the individual are alike solely dependent upon the financial condition of the farmer; and

"Whereas, The enactment of the proposed general eight-hour law would cripple the fruit, farming and allied industries of California and paralyze industrial progress and business; and

"Whereas, Increased taxation, accident insurance, higher wages, uncertain crops, all tend to add to the farmers' burdens; and

"Whereas, California, by reason of her geographical position, is already badly handicapped in reaching the domestic as well as foreign markets; and

"Whereas, The laboring people would be deprived of a large portion of their means of support by reason of the spoiling of much of the fruit crop; and

"Whereas, The immediate result of such a law would be the great depreciation of property values; and

"Whereas, No real benefit could possibly accrue to the working man or to anyone else; be it

"Resolved, That the Morgan Hill branch of the Farmers' Educational and Cooperative Union is opposed to the enactment of a universal eight-hour law; and be it further

"Resolved, That it is the sense of the Morgan Hill branch of the Farmers' Educational and Cooperative Union that organized effort should be made at once to educate the voters, especially of the towns and cities, who know little or nothing of the farmers' needs, to the end that they may not be induced to vote for the amendment calling for such a law.

AVOCADO NOTES

Written for the California Cultivator

By O. N. Cadwell, Carpinteria.

As there is more or less said or written about the avocado, or alligator pear as some call it, I will venture to give a little of my experience:

YOUNG AVOCADO TREE

Photo of Avocado Taken by Joseph Sexton June 19th. Loaded with Fruit Yet Only Seven Feet High.

In June, 1911, I set about 50 seedlings. About three-fourths were small plants, running about five to eight inches, balance about 20 inches high. I estimated their age at one and two years.

They were planted in ordinary hill or mesa land; part rather shallow soil with a hard stony subsoil. The trees have all grown thriftily and have not suffered any from frost.

Last year, 1913, a few of the trees blossomed, four or five of them maturing specimens of the fruit. One tree bore some three dozen, the others one to five. All purple thin-skin, averaging about four ounces each in weight, and compared to the larger ones on the market were as good in quality. Season November to March. This year nearly all the trees blossomed and have more or less fruit. Some are loaded and bending to the ground.

The trees, all being seedlings, there are no two just alike, differing in foliage or growth, and the fruit seems to differ as much as the trees. We hope to get one or more varieties that will be well worth growing. The whole thing is an experiment with me. The trees are beautiful all the time.

Joseph Sexton of Goleta is much interested in the growth of the avocado and is very generous with his time and money in testing varieties from many places to find out the very best varieties that can be successfully grown. He certainly deserves a great deal of credit for his work and undertaking.

Electric Driven Centrifugal Pumps

It is absolutely noiseless and has neither pistons, valves or gears to get out of order.

Every Byron Jackson Centrifugal Pump is designed to operate continuously under various conditions.

Only the highest grade of material and workmanship enter into its construction. Severe tests have proved that its high efficiency is sustained over long periods of service.

Patented.
Jackson "1912" Direct Connected Pump.

Electrically driven centrifugal pumps are used extensively for irrigation work.

We furnish these pumps for one horse power up.

SUGAR

The beet sugar manufacturers are making an appeal to the housekeepers of California to use the home product. With duty free sugar soon to come, it is a question whether sugar beet growers and manufacturers will remain in business, and the only way that coast people can aid is to increase the consumption of this one of the great products of the west. We believe that in every way beet sugar is the equal of cane sugar, although there has been a prejudice against it on the part of some housewives. Chemical analysis and experiment station tests make the point that wherever cane sugar may be used, beet sugar may take its place.

PROTECT "COOPERATIVE."

The suggestion was made at the recent state fruit growers' convention that there should be legal protection given to the word "cooperative" and to all words which might be used to convey the impression that a concern is a cooperative one, when, as a matter of fact, it is simply a corporation handling produce for profit. There have been cases where producers have been misled by the use of the word "cooperative" when there was no cooperation. Cooperation has enough problems confronting it without having to beat down a prejudice which may be established by the transactions of concerns which have claimed to be cooperative. Let our legislators consider this matter.

A TON OF WATER

We have seen the statement in an eastern farm paper that there are plenty of women in farm homes engaged in lifting about one ton of water every day. This certainly seems an immense load to put upon the farm woman. Possibly the figures are manipulated slightly so as to make a good story, for we imagine but few farm women of even sturdy stock would stand up under such a continuous load. But sure it is there are too many homes where the working appliances are of the crudest and where the home keeper becomes a mere burden bearer. There are so many labor-saving appliances which may economize effort that it is inexcusable to put such a load upon her.

COVER CROPS

Of all the questions that come to the Cultivator none are more perplexing and none come oftener than those regarding soils and how to keep up fertility. Farmers as a rule recognize the fact that the securing of the requisite chemical elements for plant growth is comparatively simple, but to keep up a proper physical condition is vastly more difficult. We have gathered a fund of information along this line which will be used in our next issue. Stable manures, cover crops, green manuring crops, or any other means of securing greater fertility will be discussed. It will be a symposium, for we will have opinions from producers in many parts of the state—and not only opinions, but facts developed through series of experiments. It will be a most interesting number and we believe will aid materially the farmer who is seeking for information as to how to maintain his soils in condition of highest productiveness.

BETTER TOOLS

The Associated Farm Papers, of which the Cultivator is one, have set about to secure information as to the work of agricultural colleges in training pupils in the handling of tools and in the advantages of improved implements and farm machinery. Sixty-seven colleges were addressed. Fifty-six responded, and of these 54 teach carpentering, 51 blacksmithing, 36 electricity, 20 painting, 48 cement construction and in 48 of the schools answering it is necessary for the student to attain proficiency in these branches in order to get a diploma. In 23 of the schools students of both sexes take up the manual work, and in 54 of the 56 the students are taught specifically the advantage of good tools over poor ones. In these 56 colleges the attendance is 25,916, and in answer to a general question as to other schools in the same state which give manual training the general answer was: "The great majority of high schools." Another few years and we believe the advantages of manual training will be even more apparent than they are today.

WAR

With wars and rumors of other wars yet to come, it looks almost as if all the governments of the world were entering into the turmoil. We sincerely trust the western hemisphere will remain out of the war zone. There will be enough for America to do to feed the combatants on the other side of the ocean. With the Panama canal open the Pacific coast will be able to do its share and reap certain benefits. There never seemed to be a better opening for the dispersal of our crops than there is at this moment.

Let us be prepared to the fullest to send through the canal in largest quantity California wheat and other grains, beans, potatoes, tomatoes and canned fruits, both dried and canned and even fresh. Then we should be ready to ship more beef and pork. The hay producer is complaining because of no demand for an enormous crop, and yet the world is hungering for more meat and is offering long prices. The crying need of California is more live stock. If war continues for years, as it may, big prices will be paid for beef, for pork and for draft animals. Fuel oil is already feeling the stimulus. The increase in these industries will give rise to others. Let the farmer be wise and take advantage of Europe's turmoil. It is not to our liking; the suffering will be great, but if it cannot be prevented we may at least provide much which will lessen Europe's hunger.

TESTING COOPERATION

Papers published in the lima bean growing sections, especially of Ventura County, report the fact that assaults being made upon the cooperative association selling the products of the lima bean ranches may prove successful. Perhaps with these attacks from outside the association there are some faults within, but we believe the greatest weakness of these associations is within their own membership. It takes some little faith in our neighbor and a thorough understanding of marketing conditions to be a good cooperator. This particular association was started to aid the small growers and the small growers were amongst its first members. The larger growers finally recognized the worth of the institution and the necessities of the marketing situation and united in supporting it. The larger dealers who were not reaping the benefits endeavored in every way to weaken the hold of the association upon its membership. This has finally resulted in the dropping away of a very large proportion of the smaller producers, and their stocks have been used to batter down the prices of their cooperating neighbors.

We hope the bean growers will recognize the necessity of holding together, for the bean industry means much to California and without the protection of cooperation we believe it will not continue to be as large a factor as it has been.

Agricultural News Notes

Hares and rabbits exported from New South Wales in 1913 amounted to 6,940,965 pairs, valued at £373,633. The carcasses are frozen before shipping.

Many Virginia apple growers have reserved space in ice and cold storage plants for their entire apple crop and will hold to market themselves instead of selling to buyers.

In the second North Coast egg laying contest concluded the last day of March on the Grafton experiment farm in New South Wales, the average number of eggs laid per hen for the year was 190. Most of the fowls entered in the competition were White Leghorns.

Japan's minister of agriculture and commerce has issued an ordinance, which came into effect on July 1, prohibiting, for the purpose of preventing the propagation in Japan of the Mediterranean fruit-fly, any importation and delivery, whether as cargo, as travelers' effects or in parcels of fresh fruits, vegetables, berries, seedpods, etc., which have been shipped from Hawaii or have been landed there.

A special train consisting of 10 cars of various refrigerating systems was sent to Siberia from European Russia in July to test the possibilities of a better exchange of products and to determine better means of distributing perishable freight. On the way out the cars will carry loads of fruit, and, as emptied in the various Siberian towns, will be filled with butter and meat to be carried as far east as Vladivostok.

A diversified farming campaign lasting three weeks has just ended in Southern Mississippi. The United States department of agriculture, the Mississippi state department of agriculture and the Mississippi agricultural college were the forces directing the campaign. The people were urged to abandon once and for all the one crop system of farming, the growing of cotton exclusively. This system was held accountable for some of the recent bank failures in the Mississippi valley.

In anticipation of the opening of the Panama canal many vessels have applied to the surveyor of the port of New York for measurement under the canal rules. There is no fee for measurement and foreign nations also can measure for the canal traffic. Under the canal rules it will cost the American steamships Kroonland and Finland $10,725 apiece to pass through the canal, or more than $21,000 for the round trip from New York to the Pacific coast ports. For a fair-sized freighter the tolls will amount to about $5000 and for an auxiliary motor yacht about $78.

An agricultural experiment station is to be established in Libya by the Italian government in the oasis a short distance from Tripoli. Experiments will be carried on in cultivation by irrigation and by dry methods and complete small farm units conducted to ascertain the value of a given equipment. Special attention will be paid to animal industry, the improvement of native species, such as the camel, donkey, sheep, goat, cow and horse, and to the increase of grazing lands and provender. A depository for farm implements and tools will be established, not only for the needs of the station, but to lend or hire for private trials.

Agricultural News Notes of the Pacific Coast

Northern California

Serious mountain fires have been raging in Siskiyou County.

The Gravenstein Apple Show is being held this week at Sebastopol, Sonoma County.

The Merced district claims over 1200 cars of sweet potatoes for this season's output.

According to the California Fruit Distributors the total shipments of deciduous fruits to July 21 were 3,777¾ cars.

Butte County apple growers are planning to participate in Watsonville's California Apple Show to be held in San Francisco.

A plan for a mammoth Butte County Fair, to be held for a month in Oroville in 1915, has been suggested by one of the county supervisors.

Much interest is being shown in the emergency potato convention which will convene in Stockton September 9, for a three days' session.

The thermometer has been staying close to the 100-mark in the hop fields in Mendocino County, and hop men are happy, as the hot weather insures good crops.

The survey of the Pitt River Irrigation and Flood Water Storage Project has been ordered. The reclamation service and Shasta County are financing the survey.

Tuolumne County's honey exhibit which was being built in the comb has unfortunately been destroyed by fire and the bees' work of many months is lost.

At the recent meeting of Pajaro Valley apple growers at Watsonville action was taken to bring a standard pack bill before the next legislature for the purpose of regulating shipments of cull fruit, both into and from the state.

From Newman, Stanislaus County, comes the report of an over-supply of crickets. It is stated the insects were attracted by lights in the open saloons and came into the bars in such numbers that the saloonkeepers were forced to close up.

The list of prizes has been published for the Ukiah Hop Festival and Mendocino County Fair to be held in Ukiah during September. The committee of arrangements states that many of the cash prizes are larger than those offered at the state fair.

For the purpose of cooperating with its newly appointed farm adviser Napa County has been divided into 13 farm bureau centers. The governing power of the county farm bureau is placed in the hands of 17 directors, one from each of the 13 centers and four at large.

The Inland Waterways Association of California has arranged for a number of meetings to be held in the Sacramento and San Joaquin Valleys on the following dates: Willows, August 5; Oroville, August 7; Marysville, August 8; Bakersfield, August 12; Porterville, August 13; Visalia, August 14; Hanford, August 19; Madera, August 20; Modesto, August 21. The object of the meetings is to acquaint all sections of the great valley with the work and purposes of the association.

Central California

Madera County has a new farm adviser appointed August 1. He is Thomas C. Mayhew.

October 14-15 has been selected as the date of the Creamery Operators' Convention at Modesto.

Apiarists of Kings County are gathering their honey crop. The general estimate is that it will be light.

The Stanislaus County Poultry Association held a meeting July 30 to discuss arrangements for their fall show.

Directors of the Kings County Fair Association have announced that the University of California will this year exhibit at their fair.

Turlock cantaloupe growers are this year shipping to eastern markets for the first time. The first casabas are now being shipped.

Sugar beet growers in the Alpaugh district of Tulare County are now delivering. The beets are showing a good percentage of sugar.

Fumigating operations in the citrus orchards of Porterville and Linsay, Tulare County, are in full swing. Every available outfit is being secured.

Directors of the Del Monte Junction Growers Association closed the membership roll for this season the first of August. It now has about 20 members signed up.

The California Cured Fruit Exchange has selected a new manager in Henry M. Ellis, and has also announced its intention to remove the headquarters to San Francisco.

The suggestion has been made that the winter fair held in Visalia, instead of being termed a citrus fair, shall be called the Tulare County Citrus, Grape, Dairy and Agricultural Fair.

Turlock reports melon prices "shot to pieces" as a result of the tremenduous crop that is being harvested. The season opened July 6 with an $18 a ton price, which has now dropped to $2.

Peach growers in the district about Dinuba, Tulare County, are discussing the need of a cannery to save them another year from the loss they have suffered this season in being unable to dispose of their fresh fruit at reasonable prices.

The Visalia Cooperative Poultry Association has filed articles of incorporation. One of the directors states: "We saved enough on our feed purchases alone to warrant the association's existence."

The California Associated Raisin Company shipped last Sunday 60 carloads of raisins. Moving pictures of the train were taken before it left Fresno, to be used at the Panama Pacific Exposition. The train was placarded, every car bearing a raisin banner.

The newly organized Comet Citrus Association of Porterville has elected the following officers: A. G. Schulz, president; I. Jay Boothe, vice-president; E. H. Strong, treasurer; F. L. Kennedy, secretary and manager. The new directors are: A. G. Schulz, P. M. Schofield, E. H. Strong, I. Jay Boothe and H. F. Brey.

Southern California

The Pomona cannery is putting out 60,000 cans of peaches a day.

Riverside is planning an Orange Congress, to be held in April, 1915.

One rancher in San Jacinto last week lost 65 acres of wheat by fire.

An addition to its lemon house is being built by the Fillmore Citrus Fruit Association. The improvement will be finished in time for the navel crop.

The U. S. department of agriculture has discovered that some oranges are being shipped to Eastern markets under false descriptions. Some of the boxes are not labeled at all.

Small express shipments of early grapes were sent from the Coachella Valley in Riverside County during the entire month of June, mostly to Arizona, Utah and San Francisco.

Committees representing the County Fair and the proposed Orange Congress to be held in Riverside next April are asking the county supervisors for aid for the two shows.

Citrus men of Southern California are somewhat exercised over the unusually large second bloom on the orange trees this year. Navels and Valencias alike are showing heavy bloom.

"Under the new marketing policy of the Walnut Growers' Association growers will save $60,000 in brokerage on this season's crop," says President Hargraves of the Orange Association.

The Palo Verde Valley Boosters' Association is working to secure a government station for the Palo Verde Valley. It will also place exhibits of products at the county, state and Pan-American fairs.

A recently rendered decision of the interstate commerce commission in the case of Pacific Fruit Exchange against the Southern Pacific Company, points to reductions in rates on deciduous fruits from California to southeastern points.

Orange County is trying to decide the question, "Whose business is it to cut weeds along the roadside?" County Horticultural Commissioner Bishop states that he believes the recently appointed board of forestry has jurisdiction over the weeds.

Supervisors of Orange County have delayed action on the formation of a storm water district to protect Anaheim and surrounding territories from the overflow of the Santa Ana river. Action has been delayed to give protestants a chance to state their views.

At the recent meeting at Fillmore of the Farmers' Club, R. S. Vaile announced that his resignation as county horticultural commissioner was before the supervisors, as he is to have charge of a new bureau of practical farm work at the state citrus fruit experiment station.

The Los Angeles County Good Roads Association has just been organized with the avowed object of "aiding to procure county, state and national aid for permanent improvement of the county highway and toward bringing about a uniformity in traffic ordinances of the various cities in Los Angeles County."

The Coast

The University of New Mexico has bought over 2000 acres of land adjoining its campus.

A number of small forest fires broke out in Oregon the latter part of July. but were quickly brought under control.

Drouth over Manitoba, Saskatchewan and Alberta is causing great loss to wheat fields. In fact the crops are burning up.

Eighty-two hundred head of cattle have been distributed among the Crow Indians of Montana. The cattle are Hereford grades.

The range in Colfax County, New Mexico, is unusually fine. Ranchers have been able to take beef right off the range without feeding.

Grasshoppers are reported as doing serious damage to alfalfa in Umatilla, County, Oregon. Grasshoppers are also attacking orchards.

Spokane County, Washington, is reported as having a bumper crop of Wagener apples, with Rome Beauties and Jonathans about average.

Prof. O. M. Morris of the agricultural college at Pullman, Washington, says that the way to stop the spread of fire blight is to stop watering the trees

The Farmers Union of Arizona has put itself on record as opposing the proposed $10,000,000 bond issue for transcontinental highways and reclamation.

Grasshoppers are reported so numerous in Umatilla County, Oregon, that they will greatly reduce the third cutting of alfalfa. They are also attacking some orchards.

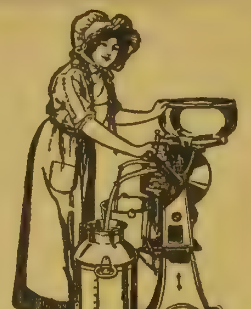
A heavy yield of peas has been packed by canneries in Webber and Morgan Counties in Utah. The canneries will next work on tomatoes, which also promise a big crop.

Officers of the Farmers Union of Walla Walla, Columbia and Garfield Counties of Washington have filed with the secretary of state an argument opposing the eight hour law.

Experts from the United States department of agriculture have spent several days in the cotton fields of Salt River Valley, Arizona, rogueing the Egyptian cotton. Seed from these fields will be used for planting by members of the central association next year.

Fruit growers of Keesling, Washington, in their local association, have declared themselves in favor of pooling the entire fruit crop of the Spokane district as a marketing measure that will lead to greater uniformity in price and insure against loss to individuals.

The Apple Growers Association of Hood River, Oregon, at its recent annual meeting adopted new by-laws whereby each member shall have, in addition to his membership vote, a voting power in direct proportion to the tonnage delivered by him to the association the previous year. One vote is given for every 100 boxes of pears, strawberries and apples and every 200 boxes of peaches and cherries. Also provision was made by which members can be expelled on 10-day notice for failure to comply with the rules.



"DOG DAYS"
the best time
to buy a
DE LAVAL
SEPARATOR

THERE WAS NEVER BEFORE as good a time to buy a De Laval Cream Separator as right now.

THE "DOG DAYS" ARE AT hand when dairying is most difficult without a separator and when the increase in quantity and improvement in quality of cream and butter are greatest through the use of a good separator.

THEN THERE IS THE GREAT saving of time and labor, which counts for more in summer than at any other season and often alone saves the cost of the separator, aside from all its other advantages.

THIS IS LIKEWISE THE SEAson when De Laval superiority counts for most over other separators,—in closer skimming, larger capacity, easier running, easier handling, easier cleaning and absolute sanitariness.

A DE LAVAL CREAM SEPArator bought now will easily save its cost before the end of the year, and it may be bought for cash or on such liberal terms as to actually pay for itself.

Look up the nearest De Laval agent AT ONCE, or drop us a line and we will have him look you up.

Live Stock and Dairy

THE LITTLE RIVAL OF THE COW

Written for the California Cultivator
By Jean A. Koethen.

Almost in the shadow of the Arroyo Seco bridge at Pasadena a slender little woman, Miss A. E. Wood, is pioneering in a business which may some day become as common as the breeding of chickens, the breeding of Swiss goats for family use and the production of milk which is a little purer and richer than that of most cows and better than any other for babies and invalids.

It surely should be better than any other, for the price it brings, 25 cents per quart, is prohibitive for ordinary people. Even at that price Miss Wood says there is little profit in the dairy, for babies are hard to please, and if the milk does not agree with them she must look for other customers. It is very expensive, too, catering to babies. An ordinary goat, such as you and I might keep in our back yards, may have for the green part of its ration rose cuttings and trimmings from any shrub or tree, such as I saw Miss Wood feed her stud. It may also have potato and apple parings, carrots, turnips, and for aught I know, tin cans and old shoes. The goat that supplies milk for delicate babies gets no such luxuries as these. Alfalfa at $16 a ton, or clover, if it can be had, are the only greens permitted. Even the alfalfa does not always suit. Sometimes it is too stemmy. Then the goats take the leaves and the stems go to the chickens.

The great advantage of goats' milk over cows' is, that it is absolutely free from tuberculosis germs. It is also richer than cows' milk and contains less curd.

"The keeping of a goat for family use is getting to be quite a fad," said Miss Wood. "Whenever I am ready to part with a doe I find a customer waiting. The demand is always greater than the supply. A goat, you know, is much easier to keep than a cow. It can be picketed in the back yard or tied on a vacant lot, requires but little shelter, eats the refuse from the kitchen and gives just milk enough for one family. A doe I have for sale now for a family that is leaving town has been giving from three and a half to four quarts for nearly a year, and has supplied the family not only with milk, but with all their butter. It is said that seven goats can be fed for what it would cost to feed one cow. I think, with the kitchen refuse and green stuff a family could provide, a goat could be fed for 10 cents a day. In that way you get all the milk you can use, and your butter beside, for the price of a quart of cow's milk daily."

These Swiss goats are known as Toggenburgs, from the name of their native valley. They are no longer imported, however. A hoof and horn disease is making great ravages among the goats on the continent, and a strict quarantine is maintained.

The average milk production of these goats is from three to five quarts daily, and a goat maintains her productiveness much longer than a cow after being bred. Miss Wood pointed out one doe that was bred 10 months ago and is still giving two and one-half quarts per day. When this doe was fresh she gave four quarts.

A doe never does her best the first year or the second. In fact it is not till she has been bred three times that she is really at her best. Does are not bred till they are a year old. There is no haste, for they are profitable milkers till they are 10 or 11 years old.

Miss Wood has two grades of stock, the pure-bred Toggenburgs, which are a soft brown color, and the grades or half-breeds, which are a grayish white. She is improving her stock as rapidly as possible, and will before long have nothing but pure-breds. A grade doe may be had for from $35 to $50, but a mature pure-bred Toggenburg costs $100. The grades are good milkers, but the pure-breds are better. A pure-bred kid is worth $75.

What do they eat, these high grade, pure milk producers? A balanced ration, similar to that of a cow, just what, Miss Wood would not say. "If I told you today, it would not be true tomorrow," was her smiling reply. "I am changing and experimenting all the time as I get new suggestions from the agricultural papers." In general, they have a mash of whole and ground grain in the morning, and alfalfa or clover at night—only two meals a day, for their busy mistress has not time to give them three.

Several kids were running about among the does, gentle little creatures, apparently more suitable for children's pets than for subjects of scientific experimentation. They are easy to raise, but are very sensitive to dampness and must be carefully housed at first. The old stock is indifferent to weather and sleeps out altogether when the nights are fair. A shed with a tight roof is at hand, however, and the gate always open, so that they may sleep in or out as they please.

Brutus, the stud, is the registered son of a four-quart mother, for inheritance is just as important among goats as among cows or fowls. He is a fine, handsome fellow, and the pet of his mistress, who never goes walking without bringing home some succulent dainty to tempt his appetite and cement his affection.

It was getting toward feeding time as I picked my way throug the corral and up the hill to the crest of the arroyo, and does and kids were crowded about the gate waiting to be called to their supper which was already carefully distributed through the mangers under the shed. Some of them followed me to the farther gate, feeling sure, no doubt, of the kindness and good will of any creature in petticoats, for they are like confiding children, these denizens of the Swiss mountains.

It is not the easiest work in the world, caring for a herd of from 12 to 20 milk goats, but Miss Wood likes it, and finds as much pleasure in the working out of the problems of feeding which every breeder must work out, as in the anticipation of the day when she can let the dairy go and devote herself to raising $75 kids for family use.

MARKETING ALFALFA ON THE HOOF

(Continued from Page 123.)

post, and a socket with pivot at bottom with another steel band to hold the gate post in place. The men shown in this picture, reading from left to right, are Mr. R. P. Cundiff, Mr. W. B. Phillips of Porterville, and Mr. W. E. Premo leaning against the gate. Mr. Premo is secretary and manager of the corporation, which owns 700 acres of alfalfa in this great ranch.

The watering arrangement cannot be fully shown, though a hint is given in the illustration where Mr. Cundiff and Mr. Phillips are standing by its side. The electric pumping plant is shown in the background between the two men. From that the water flows in underground pipe to the water stand pipe shown in the engraving. It is forced to rise almost to the top of this standpipe, when it flows over in a large stream to the underground pipe which carries it to a similar arrangement in the next corral, from that to the next, and so on from corral to corral, giving to each a perpetually renewed supply of fresh water. The large stream escaping at the lower end is, of course, used in irrigating the alfalfa. This pipe line is 4200 feet long. The association, or rather the Porterville Alfalfa Company, is a stock company organized under the laws of California, and handles this farm the same as it would any other business proposition. The officers of the association are: E. E. Graham, president; Wilko Mentz, vice-president; W. E. Premo, secretary and manager; J. A. Ulmer, F. S. Kennedy, G. L. Robbins, directors.

ECONOMICAL MILK PRODUCTION

The manufacturer perhaps more than the retailer looks closely after the matter of cost, knowing that his principal hope of making a good profit lies in attaining economy in the actual production of the article, for no profit can be expected if the seling is below the cost price.

Is not the dairy farmer a manufacturer? So it would seem to be wisdom to look the more closely after cost especially as he does not expect the selling price of milk to soar. Assuming that the farm is in good condition and carefuly handled, what does milk cost per hundred pounds? That can be ascertained only by keeping records of each individual cow.

This is all the more necessary because "men (and cows) were deceivers ever". They may appear to be good heavy producers, but their value as economical producers can only be determined when their yield of milk and fat is checked up by the scales and test. Of what use is it when the factory pays 95 cents per 100 pounds to keep cows whose milk costs $1.25 per 100 pounds just for feed alone? This is what often happens till cow testing is taken up.

It is quite possible to have one dollar's worth of feed return two dollar's worth of milk through good cows, that is cows selected by the test. This is both economical and profitable milk production. The average cow is not an economical producer because she has not been selected, but, like Topsy, "just growed". A dairy farmer will prove his busines ability as a manufacturer when the herd is composed of economical producers. Make each cow pay a good profit C. F. W.

EFFICIENCY ON THE FARM

One of the most frequent sources of loss on the farm is an insufficient return from work horses.

Have you satisfied yourself on the following points?

Do your horses earn enough to pay for their feed and care, and enough to meet the interest, depreciation and other expenses, as harness costs and shoeing?

It costs $100 annually to keep the average horse, in Minnesota, but this horse works only a little more than three hours each working day. This makes the horse labor cost approximately 10 cents an hour.

Do you handle the horse labor on your farm so that the annual cost of keeping your horses is less than the average, or so that the number of hours worked is greater? Both methods will reduce the cost of horse labor, but the latter offers by far the greatest opportunity.

Can you revise your cropping system so that fewer work horses will be needed, or so that the work will be more equally distributed and thus make it possible to employ them more hours each year?

Can you raise colts and thus reduce the cost of keeping your horses?

Can you arrange to use your work horses for outside work when not busy on the farm?

Can you reduce the cost of keeping each horse by feeding less feed or cheaper feed and still give a proper ration?

Farm work done with fewer horses means a saving of $100 a year for each horse not needed.—A. H. Bento, Minnesota University Farm.

DIPPING HOGS FOR MANGE AND LICE

Treatment of hogs for mange should begin with a vigorous scrubbing with brush, soap, and soft water so as to remove the crust. A variety of coal-tar dips are on the market. Most of these are quite satisfactory if of sufficient strength and warm enough (about 110 degrees. Do not boil). The hog should be given a good thorough soaking in the dip, not less than two minutes. The hog must go under, head and all, at least once. Treatment must usually be repeated one or more times at intervals of eight days. Treat the whole herd and do it thoroughly.

An effective dip can be made from crude petroleum as follows:

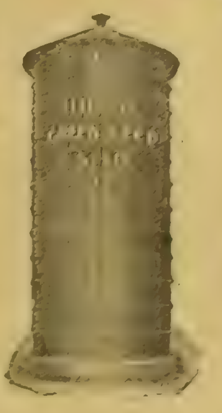
4 gallons crude oil
16 gallons water
1 pound soap.

The soap should be dissolved in the water by heating. An emulsion is then made by adding the oil and thoroughly churning the mixture. Water in different sections differs very greatly in the way it will combine with soap. If this amount of soap does not give a good emulsion simply add more soap. Avoid oily dips in cold weather.

While the hogs are taking the dip, thoroughly clean and then disinfect the pens. In case of true mange the fence posts, trees, and everything against which the hogs can rub must also be disinfected. Use a strong disinfectant and plenty of it. After treatment do not put the hogs back into lousy or mangy pens.—M. H. Reynolds, Veterinarian Minnesota University Farm.

We can only be valued as we make ourselves valuable.—Emerson.

Cut Your Cost of Producing Milk



One of our customers who is using two 20x40 silos says:

"By siloing my first and last cuttings of Alfalfa I cut down my mill feed bills over $4000.00 in one season, and the feeding of the Ensilage with chopped Alfalfa Hay increased the milk production from my 300 cows at least 10%. I consider the Silos saved their original cost the first season."

Ideal Green Feed Silos are a De Laval Product, made of the best materials in the best equipped mills on the Pacific Coast, and in every essential feature are built to suit California climatic conditions and to produce good Ensilage.

You would not purchase a leaky can for preserving fruit. Why take chances on a leaky silo when you can buy a perfect Ideal Green Feed Silo.

BUILD A SILO

If you want to save on feed,
Build a silo.
It will help in time of need,
Build a silo.
Build of concrete if you would,
Build of brick or build of wood,
Build of anything that's good,
But build a silo.

Dairy feeds are soaring high,
Build a silo.
Summer seems to be goin' dry,
Build a silo.
Cows, too, go dry fed on hay,
Sort o' seem to fall away,
They need silage every day,
So build a silo.

Pasturage costs quite a heap,
Build a silo.
Winter feeds are never cheap,
Build a silo.
Build it wide and build it deep,
'Cording to the cows you keep,
And for milk you'll never weep,
So build a silo.

That's the burden of my song,
Build a silo.
If you've cows you can't go wrong,
Build a silo.
Milk will flow and smiles'll come,
With the separator's hum,
And you'll shout "I'm glad, by gum,
I built a silo."

Krogh

This Turbine Is Very Economical

The perfect construction of the Krogh Turbine insures the very minimum running expense. The automatic balancer eliminates practically all wear. There is absolutely no end thrust. Just a smooth, soft purr—and the full flow of water is always on hand.

Economy in first cost, too. No pit is required. The working parts are submerged under the surface of the water. There are many other valuable features described in the booklet 85 B.

Krogh Mfg. Co.
San Francisco - Los Angeles.

The Old Reliable
PeterSchuttler
is the Easiest Running Wagon

It is built in the honest old-time way, by expert wagon builders—in the World's Greatest Wagon Factory. That's why it stands the wear without repair, and gives greater service and satisfaction than any other. Your horses can do more work with a Peter Schuttler Wagon—because it runs so much lighter.

Peter Schuttler Roller Bearing Wagons
run 1/3 easier by reducing friction on the bearings. A Big Improvement.

Irrigation and Forestry

THE RECLAMATION RECORD

Under authority of the act of congress of June 17, 1902, the reclamation service, one of the bureaus of the interior department, is charged with the survey, construction, and operation of irrigation works in the arid states. In connection with this work the service publishes monthly the Reclamation Record. During the early stages of the work the Record was restricted mainly to the formal report to the secretary on the progress of work on the various projects, with a summary of the principal contracts executed, specifications issued, and a few other matters of a like nature.

Secretary Lane a few months after taking charge of the interior department determined to make the Reclamation Record a medium of communication between the interior department and the water users. To accomplish this he directed that it should be made a more popular publication, embodying the best thought obtainable upon the problems of the irrigation farmer.

The reclamation commission, in hearty accord with this policy, adopted a resolution providing for the enlargement of the scope and purpose of the Record to include matter of more general interest to the water users and to subordinate the engineering features to the farming and irrigation activities. In addition it was decided to send the Record free of charge to all water users on reclamation projects who expressed a desire to have it.

About 7000 water users now receive the Reclamation Record regularly, and numerous requests from others to have their names placed on the mailing list are coming in.

Anyone in the remotest degree interested in a reclamation project should make arrangements with the Reclamation Service, Washington, D. C., to receive the Reclamation Record, the subscription price of which, to other than water users on the projects, is only 50 cents a year.

SACRAMENTO VALLEY CORN

Written for the California Cultivator
By Sacramento Valley Contributor.

Early in July a merchant in a Sacramento Valley town returned from an eastern trip, and in telling about it, remarked, "The country is beautiful, back there; everywhere you look, through Ohio, Indiana, Illinois and Iowa, there are beautiful corn-fields—corn 'knee high.' Too bad, we can't raise it here."

A friend, who was listening said: "Do you know that right now I can take you to a dozen places, within 15 miles of here, where corn is now 10 to 15 feet high?" And our merchant friend was very much surprised to learn it.

It is interesting to hear people all over the great interior valley of California say: "Well, we can grow some things pretty well, but this really isn't much of a corn country," when it is quite possible that within a few miles there may be as good corn growing as there is in America.

All that is necessary to increase many fold the corn crop in the San Joaquin and Sacramento Valleys is more corn growers. And it is pleasing to note that every year the acreage is increasing.

Around Hanford, in Kings county, there are some fields of corn, where the stalks average 12 to 15 feet high and big ears were forming by the middle of July. The same is true at Princeton in Colusa County, and around Butte City and Willows in Glenn County. It is a crop that does not need further demonstration to prove to any one interested that it can be grown and that it will pay, and the answer to the question: "Why isn't more corn grown?" is as near as we can arrive at it, either that we have too many other crops, or that we just haven't acquired the "corn growing habit."

There is no place where corn can be grown to better advantage than in California. We have the alfalfa in abundance to balance a stock ration, and corn will do more effective work in making meat here than in the East, where in winter a big per cent of the corn fed goes to keep the animal warm in order that another part of the corn or other feed may be effective in meat making.

And nowhere is the crop grown with less effort. In the Sacramento Valley it is planted anywhere from May to July, and it generally gets little, if any, cultivation or irrigation after planting. Not but that it would be a good thing to cultivate and irrigate, but it generally does well enough without it. All that is considered necessary is a good supply of moisture in the soil from winter rains, flood or irrigation, and plowing, harrowing and cultivation to conserve this moisture until the seed is planted.

A great deal of Egyptian corn is grown in all of the great valley. There is a big acreage this year in the Tulare Lake country and all along the Sacramento River. Much of this is threshed and sold for chicken feed, and some of it fed to hogs.

The acreage of Indian corn in California is sure to increase as we get more silos, and the acreage of both Indian and Egyptian corn must increase with the growth of the hog business.

Spraying Time
and there is no better spray than
Scalefoe

Not only for scale but nearly all insects, worms and bugs that infest plant life. It has been killing them for 15 years, giving the greatest satisfaction without injury, but positive benefit, to the plant. Write for circular with testimonials or better, try it.

Gallon can, 50c;
5-gal. can, freight prepaid, $2.00.

Must be mixed 20 parts water to one Scalefoe before using, making it very cheap. Write for prices in barrels delivered at your freight station.

THE FINE ART OF FEEDING

Written for the California Cultivator

By Jean A. Koethen.

Some one has said the proper feeding of laying hens requires, first, good hens; second, good feed; third, a good feeder. The good feeder is the man who understands his hens, who knows by an intuition which is almost a sixth sense, which are inclined to fat, which are eating too little, and who fits his feeding to the condition of his fowls and the time of the year.

In an experiment by Professor Dryden of the Oregon station, two pens of fowls consumed an average of 75.6 pounds of food, not counting green feed, and laid an average of 167 eggs per fowl. Two other pens, on just the same amount of food, with practically the same nutritive ratio, but with a different feeder, laid but 117 eggs each. Professor Dryden's skill in using the feeds at his command, in combining them in such a way as to give the variety which is the soul of feeding, and in making his hens work, made a difference of just 50 eggs per hen, and 50 eggs, at the average market price of 30 cents per dozen, would add $1.20 to the average income per hen.

If there is such a thing as a key to successful feeding it probably lies in these two words, "variety" and "exercise." That the ration should be balanced is, of course, understood, but there are at least a thousand different balanced rations, and every one may be unbalanced by the hen that eats it. What hen does not pick through her hopper of dry mash for the particular bit that pleases her, or turn her back on one kind of scratch grain in order to fill her crop, if possible, with another? The skilful feeder feeds a variety of grains—oats and corn in the morning, wheat at night, perhaps — feeds his mash moistened sometimes, with the addition of table scraps, cut-up greens or sour milk; gives beefscrap in winter and fishscrap in summer, or vice versa; buys green cut bone when he can afford it, and sometimes substitutes vegetables for alfalfa and mush for mash. Just how much it is worth while to vary from the regular menu of dry mash and scratch grain each feeder will determine according to circumstances.

If variety is important, exercise is the summum bonum, the ultimate aim and object of the careful feeder. If a hen can only be kept moving she will lay on almost any sort of ration, or on none at all, as a pullet of mine did this spring. Going broody, just as one of my large hens brought off a hatch so small that it was beneath her dignity to mother it, this pullet was given two chicks to mother. Pens and coops were all occupied, so I literally turned this brood "out to grass," giving them a box to sleep in, and occasionally, when I happened to think of it, throwing them a handful of chick feed. You would have thought that pullet (she was a tiny thing, too) could never have laid on such fare, but she was at it again in three weeks, and the two chicks, which she dragged round from morning till night in her search for food grew amazingly. When she left them, they continued to hustle for themselves, stealing from the turkeys whenever they could, and at a month old, were roosting in a tree. This does not prove anything, naturally, but it does suggest that exercise on good range will make up for a lot of deficiencies in the ration.

Without range it is difficult to secure exercise enough for the heavy breeds. Leghorns will keep hustling whether they need to or not, but Orpingtons and Rocks must be coaxed and encouraged to keep moving. Probably very deep scratching litter with the grain buried deep is the best substitute for range. The hens will scratch if they must, but only if they must. Many feeders keep the mash hoppers closed till noon, feeding in the morning nothing but hard grain in the litter. Others leave the mash accessible at all times, and give enongh grain at night to keep the fowls busy the next day. Others, again, throw a little grain into the litter in the morning and a little more at noon, that the fowl may always have something to work for. It doesn't matter how it is done, just so the hens are kept busy.

When scratching litter is scarce, it is a good plan to bury oats, which have been soaked over night, in the runs, but not too deep. After three or four days turn up the ground with a spade in one or two places and the hens will have a merry time digging and scratching for the succulent sprouts.

In feeding the heavy breeds, corn should be avoided except in very cold or rainy weather or for young stock, which can manage a good deal. Corn is the most fattening of feeds and makes the fat grow in layers, which is objectionable even in market fowls and a great detriment to laying. When the feeder handles his hens on the roost, as every feeder should, and finds them getting soft and baggy in the abdomen, he will, if he has the true poultryman's instinct for feeding, put those hens by themselves, and feed wheat and oats and green feed till they are "reduced." Leghorns may be allowed some corn, even in summer, though it is usually left out of the mash.

While we are feeding to avoid too much fat, we must be sure to have enough, for a hen must have some surplus fat before she can lay. At the Cornell experiment station a large number of Barred Rock hens were killed and cut open in order to determine the amount of fat necessary to good laying condition, and it was found that the fattest hens contained eggs ready to lay, while the egg organs of the leanest hens were entirely dormant. The explanation is that the eggs are developed in the ovary in the form of little ovules. These ovules form in follicles, and when ripe they burst and let the yolk or ovule fall into the oviduct and then pass down the oviduct where the white of the egg is formed about the yolk. A chemical analysis of these eggs shows that 64 per cent of the dry matter of the yolk of the egg is fat and that it is the only fat in the egg, except a small fraction, the white of the egg being practically pure albumen, the shell being mineral matter. It is absolutely necessary, therefore, for a hen to have some surplus fat in her body before she can start an egg, but the fact that she has this fat, or even that she has the yolks ready to be deposited, does not insure the development of the egg. Lack of food or water, rough usage or a sudden cold snap or rain may cause the material in the yolk to be reabsorbed into the hen's body for its own maintenance. Feed well then, at all times, but not a fattening ration, and if some hens put on too much fat, either compel them to "reduce," or send them to the butcher. A hen must be a good eater in order to be a good layer. If she turns the raw materials into fat instead of into eggs, off with her head.

This matter was gone into very carefully at Cornell and results charted, showing that "as hens increase in their consumption of food there is an increase of weight of body and an increase in the percentage of eggs produced." Professor Rice's conclusion is: "We must feed hens all they will eat and eat up clean of the right kind of food, because hens begin to increase in their food consumption several weeks before they begin to lay, as shown by this chart. They also increase in weight before they begin to lay. A condition of egg production is in a measure a condition of reproduction and carries with it a tendency for the animals to become fat. The history of any domestic animal bears out this statement."

In feeding any breed there must be discrimination as to age, season of the year, cost of feed.

The older a hen is, the more likely is she to put on fat, especially if she is a Rock or an Orpington, and the more must fattening feeds be guarded against. Young stock need some corn, particularly the cornmeal in the mash, and cracked corn is very good for them in combination with wheat or barley.

Summer feeding is differentiated from that of winter in this climate mainly by leaving out corn and cornmeal. In the east it is buckwheat that is omitted. At the Cornell station the mash, which consists of 60 pounds cornmeal, 60 pounds middlings, 30 pounds bran, 10 pounds alfalfa meal, 10 pounds oilmeal, 50 pounds beefscrap and one pound salt, is used without change summer and winter, the only difference being in the hard grain ration which in winter contains buckwheat. Here in Southern California the association mash is mainly used. It consists of (per ton): 600 pounds bran, 300 pounds shorts, 100 pounds feed meal, 200 pounds kaffir meal, 150 pounds beefscrap, 150 pounds fishscrap or whale meat, 70 pounds fine ground bone, 100 pounds alfalfa meal, 400 pounds ground barley, 10 pounds salt. In summer the feed meal is omitted.

There has been a good deal of discussion the last few years in regard to feeding during the molt, but the most common practice at present seems to be to feed well, but without much change from the ration of the rest of the year. At Cornell 120 hens which were well fed during the molt, but without any special "dope," each produced 25 cents' worth more of eggs in a year than the same number of hens which had been starved for two or three weeks according to the Van Dresser method. These hens were Leghorns, as are those of a Riverside breeder with whom I talked last week. This gentleman, Mr. W. G. Suits of the Bandini Poultry Ranch, says he makes no difference at molting time, except to give a moist mash in the morning in addition to the dry mash which is before the hens all the time. This mash is moistened with sour milk and contains the green feed as well. With heavy breeds it is probably best to reduce the feed somewhat at the beginning of summer, for these hens are likely to be overfat after the heavy feeding of winter, and an overfat hen cannot molt easily. When the hens are rid of their superfluous fat and have dropped most of their feathers, a little linseed meal is added to the mash and sunflower seed to the grain ration. Both these feeds contain a good deal of protein, and protein is as necessary for growing feathers as it is for making eggs.

Cost is always an important element in determining the ration. "Feed what you have or what you can get most cheaply" is a good rule. This applies particularly to barley, which is cheaper than any other feed just now in California. Barley has not always been considered a good feed for chickens. A bulletin of the Oregon station as recently as 1909 spoke of it disparagingly as "not extensively fed to poultry, but it is coming to its own and when properly prepared is as palatable as any feed. Neither whole nor rolled barley, dry, appeals to fowls, but steamed or soaked, it is very wholesome and they are fond of it. It is a good

(Continued on Page 143.)

The Summer Season

Don't expect to cram for eggs in the fall without preparation during the summer.

COULSON'S
EGG FOOD

used during the summer will reward you with a good egg yield in the fall. Secure it from any reliable poultry supply house.

Protect Your Chicks

White Diarrhoea is fatal and very contagious. It attacks chicks the first five weeks and kills 60 to 75 per cent of all chicks hatched. May wipe out your whole hatch. Save your chicks by putting in their drinking water

CONKEY'S
White Diarrhoea Remedy

Chicks drink freely and doctor themselves. Don't take chances on losing your whole hatch. Keep Conkey's White Diarrhoea Remedy on hand as an effective treatment and preventive measure. Prices 25c and 50c.

Lice Eat Poultry Profits

Lice are responsible for many poultry diseases, poor egg records and great loss of profits. You can get rid of them quickly by dusting your fowls with

Conkey's Lice Powder

A combination of effective lice killing ingredients. Use it on setting hens now, because it Kills the Lice—Doesn't harm Chicks. Price—15 oz., 25c; 48 oz., 50c.

Spray your poultry house and paint the roosts with

Conkey's Lice Liquid.

Thoroughly wipes out these pests that prey on your chickens at night. Qt., 35c; Half Gal., 60c; Gal., $1.00.

Guard your chicks against the deadly head lice.

Conkey's Head Lice Ointment

Kills them every time — doesn't harm chicks. 10c and 25c.

FOR GROWTH A AND EGGS FEED
STANDARD EGG FOOD

Standard Egg Food is composed of the best mill feeds, fish meal, meat scraps, bone meal, soy bean meal, oil cake meal, granulated milk and charcoal, properly proportioned.

Standard Egg Food should be fed as it is in a hopper and kept before your fowls at all times, but may be fed wet if preferred. It will make eggs.

PEERLESS POULTRY SUPPLY CO., 409 E. Third Street Los Angeles, Cal.

Low-Nozzle Traction Sprayer

THIS Sprayer is only one in the large and complete line which we handle. It has 12 nozzles, covering 4 rows, and sprays the plants completely—top, underside and all sides—enveloping them in a dense fog. Will spray rows 28, 30, 33 or 36 inches apart.

Four nozzles spray the tops of rows and the 5 pipe extensions give 8 nozzles close to the ground—2 each on the inside pipes and 1 each on the outside pipes. Lower nozzles are adjustable.

3 MACHINES IN 1

A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes. 1 and 3 sections. **Sold direct to you on one year's trial. Prices, $22.00 and up.**

THESE WHEELS ARE THE SECRET OF OUR SUCCESS.

We want every farmer and landowner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Possibly Red Spider.

My umbrella trees are losing their leaves. They are covered with web, but I cannot find any insect. The lawn grass under them is also dying. What is the trouble? Can I use a spray to control it?—Subscriber, Porterville.

Possibly this is a case of red spider or red mite. After the work of this pest becomes so pronounced the pest has usually passed on. It may be controlled by spraying with sulphur lime solution 1-33 or, if dry sulphur is preferred, the scattering in the tree of liberal amounts will secure at least a degree of immunity.

Homestead Lands.

Where can I get information regarding homestead lands in California?—

Of course, the land office in the district in which you wish to secure lands should be able to inform you as to location of lands in that district. We believe, however, that the land offices usually permit examination of books showing filings made, but do not make any report to prospective settlers. There are government land locators, but we do not know as to the integrity of these. Cases have been known where locators have placed people on rocky hillsides of no value whatever. The California Development Board has issued "Government Lands Newly Opened in California." Write the board, Ferry Building, San Francisco, for this list. U. S. land offices in California are located at San Francisco, Los Angeles, Susanville, Visalia, Eureka, Sacramento and Independence.

Diarrhoea.

What is the cause of diarrhoea with little chicks? Put out ten a week ago and lost all but one with it. Have been informed that water causes it.—Subscriber, Dixon.

Chilling, feeding too soon, and feeding sloppy or indigestible foods are the most common causes of diarrhoea in young chicks. Bacillary white diarrhoea comes from a germ on the egg laid by an infected hen, but this disease is rare in California, and it is much more likely that your chicks were chilled or improperly fed. Young chicks should be protected from wind and dampness the first four or five days, even when they are hovered by a hen. If they are kept warm and fed simple dry feed, such as rolled or steel cut oats, commercial chick feed and bran, or hard boiled eggs chopped, shell and all, with stale bread, there should be no trouble. Give them all the clean, fresh water they want.—J. A. K.

Poisoned Chickens

My chickens are afflicted with a peculiar disease. They appear to be in good health till a sort of paralysis attacks them, commencing in their legs and gradually spreading to their bodies. They go around in a sitting posture for a day or two and then fall on their sides, from which position they are unable to rise. In several hours they are dead. Can you give cause and remedy for this trouble?—Elmo Subscriber.

There must be other symptoms, diarrhoea, perhaps, or dark comb. It looks to me as if these chickens had gotten hold of some kind of poison, such as copper or arsenic from a spraying mixture or lead or zinc from paint skins carelessly thrown out, but overfeeding with too rich food sometimes produces similar symptoms. See that their diet is right—plenty of green feed, no corn, and that they scratch for all their grain. And look for poison. Give the sick fowls a teaspoon of castor oil or 20 grains of Epsom salts as soon as they are taken, and separate them from the others. This is all that can be done until you find where the trouble is.—J. A. K.

Moth-Catching Plant

Some time since I saw cuts and description in your valued paper of an insect destroying plant said to be the only one in the state. I have several vines that are identical except the leaf, which is shorter and lacks the vining. In other respects they appear the same—seem to be honey plants and are very sweet scented. Last evening I observed the moths on them and this morning I went out, to find them caught as in the specimen I send you. Will you kindly tell me the name of the plant and moth?—Subscriber, Hanford.

This plant is one of the milkweed family and bees frequently get so covered with the pollen masses as to be unable to get away. I have never observed such a large species of moth as this (Humming bird moth) captured in this manner by the plant. The plant I do not recognize from the fragment sent. Does this happen often?—A. D.

Alfalfa Refused to Bloom

The third cutting of alfalfa in this portion of Fresno County refused to bloom, the buds turning white. Around the edge of some fields and on the levees a very small portion of the plants bloomed. The crop was from one-third to one-fourth short. Some think it was caused by hot winds, others that it is the Utah weevil. I am inclined to think it the latter.—Subscriber, Kerman.

This query was referred to Mr. J. M. Bomberger of Modesto, who writes:

"It is probable that the 'alfalfa bacteria' on the roots have been killed either by too heavy irrigation or too close subirrigation, or there may be too high a percentage of salts in the soil; also that condition some time exists where the soil is quite sandy and has been leached by heavy irrigation. The alfalfa being all right on the levees would indicate the latter cause."

Sharpening Lawn Mower

On page 104 of last week's Cultivator we gave an article regarding sharpening lawn mowers, and have the following comment by Dr. R. R. Snowden of Los Angeles, one of the most practical observers of practical things connected with rural life.

"The article in the July 30 issue on 'Sharpening Lawn Mowers' will doubtless cause much work on lawn mowers with a chance of doing harm. Every lawn mower I have ever used had an adjustable bar that the blades slide over, cutting the grass between bar and blade. By setting this bar at the proper angle and contact with the blades both the bar and blades keep sharp without any filing or other work."

Rosebuds Failing to Open

When roses form buds and they fail to open, drying up before expanding, my experience is that applications of gypsum will cure the trouble and cause the roses to bloom normally. After two seasons of failure the analysis of the soil indicated the proper treatment, which, being followed, brought desired results.—R. R. Snowden.

Tomatoes Dropping

Commenting further upon a query which we answered in last week's Cultivator, Dr. R. R. Snowden writes:

When tomato blooms drop and the plant refuses to fruit it simply needs a reminder that it has grown enough and that something else is expected of it. This is successfully done by pinching off the terminal buds of all or most of the branches. My tomatoes that produced luxuriant vines and many blooms, but no fruit, responded promptly to this treatment both last season and this. So far as I know it does not fail.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Lymphangitis

About five months ago I worked a large four-year-old mare to a load for a mile or two over boulders in a creek bed. Next morning her hind leg was swollen between fetlock joint and hock and there was slight lameness. Thinking it not serious I hitched her up again and in a short distance she seemed relieved and worked the same as the day before. Next morning the symptoms were worse. Gave her complete rest for several days with no change. Put her to work again on soft ground with the same results, lameness and swelling each morning relieved by work. Could detect no heat, but on pressure the parts would stay indented for some time. Had her shod and in a few days she improved so I thought she was cured. Two or three weeks ago the trouble seemed to return and now she is worse than ever and swelling extends to the body. Seems healthy other ways. What is the trouble? — Reader, Monterey County.

The mare has lymphangitis, a disease that is caused by overfeeding Overfeeding causes the blood to become thick so it flows very sluggishly through the blood vessels. You probably know that the blood is carried to the different parts of the body through the arteries and returns through the veins. A third set of vessels called the lymphatics gather up the refuse, and after passing it through several glands return the material they are carrying to the veins. Several of those lymph glands are located in the inside of the hind leg, and when the blood is too rich those glands are taxed to their utmost. Any little scratch below the hock is liable to irritate the parts and cause the glands higher up to become inflamed. This clogs the lymphatics in that limb and causes the parts to swell. Often both limbs are affected. I hope this will make clear to you what is wrong with the mare.

To relieve her reduce her feed and give a physic, as follows: Aloin, one ounce; turpentine, six ounces, and raw linseed oil, enough to make two quarts. Mix. Shake well and divide into four doses. Give the doses four or five days or a week apart. After giving a dose if the mare is physicked noticeably, then do not give the next dose for a week. Also give her the following powders: Nitrate of potash, eight ounces; bicarbonate of soda, two ounces, and powdered gentian, two ounces. Mix and make into 12 powders and give one every day. For external treatment rub the swollen parts well with the hand morning and evening and apply the following lotion once a day: Chloride of zinc, one and one-half ounces, and water, one gallon. The lotion will do more good if you warm the amount you use just before applying it. Do not pour it into a metal dish. Warm it in an earthen or granite dish.

Abscess

Our milch cow has repeatedly had a lump on the left side of jawbone. We have opened it and found it full of pus. It gathers again immediately and she seems to be in great distress until it is lanced. Thought it was due to oat or barley beards, but find no trace of that. We feed oat hay, alfalfa meal and barley. Will it affect the milk?—Subscriber, Santa Cruz.

Can only suggest that the next time it is lanced a large opening be made. Wash it out and fill the cavity with air-slaked lime. Dust some of the lime into the cavity once a day until it is healed. The milk will not be affected unless it is due to tuberculosis. Would advise having her tested for tuberculosis.

Mare Thin

Have a mare 17 years old with a colt four months old. Feed her rolled barley and oat hay. She eats well, but is very thin. Will have very little work for her until plowing. Please tell me how to feed. What and how much for each feed? Would steamed barley be more nourishing and would stock molasses be beneficial?—Subscriber, Lincoln.

The mare may be a good milker and that would keep her thin while suckling a colt in spite of plenty of feed, good care or medicine. You say the colt is four months old. That is the proper time to wean it. With very few exceptions the mare and colt will both do better if the colt is weaned at four months old. At the age your mare is, would advise having the teeth fixed. Then do not overfeed. As to the amount of feed: One pound of hay to each 100 pounds of horse every 24 hours is enough, and when working hard the same amount of grain is about right, but when not working reduce the grain rations about one-half. That is a good general rule to go by. Give very little of the feed in the morning, not a large feed at noon, and most at night Be sure to allow plenty of drinking water. Steaming the barley once a day would make it easier to digest and help to regulate the bowels. Stock molasses is all right when fed sparingly. A teaspoon of baking soda once a day in the feed will also aid digestion.

Swelling on Chest

Have a 12-year-old mare that has swelling on her chest caused by reaching over manger. Have been bathing it and applying liniment, but it does no good.—Subscriber, Lincoln.

For the enlargement on the chest of the mare there is only one remedy. Spit it wide open, up and down, then dress it once a day with a good antiseptic solution. Permanganate of potash, one dram to a quart of water is good.

MONEY MAKING LITTLE LINERS

In this department we will insert your advertisement under a classified head for 12 cents per line per issue. No ad accepted for less than 3 lines. Our classified columns are the clearing house for our many thousand readers.

MACHINERY

SECOND HAND WINDMILLS, TANKS, PIPE PUMPS ENGINES
RANCH AND POTATO MACHINERY

New 1000 gal. galzanized tanks, $19.50; 2000, $29.50; 8 ft. windmills, $19.50; 10 ft., $29.50; 12 ft. $45.00.

HAY MACHINERY

La Dow baler, $95.00; Whitman Power baler, Southwick Power baler, binders, headers.

POTATO MACHINERY

Potato diggers, planters, cutters, cultivators, harrows, plows, Holt tractor, sprayers, sundries.

ENGINES AND PUMPS

8 H. P. Stearns, $135.00; 20 H. P. Stearns, $195.00; 28 Lambert, $295.00; 35, $350.00; Ames double acting, deep well pump, $135.00; single acting pumps, $20.00 to $60.00. Centrifugal pumps half price.

SUNDRIES

Bankrupt sale new stocks and dies half price; gears, large pipe fittings, pulleys, belt.

Demmitt Co., upstairs, 120 N. Main, Los Angeles.

We have pumps, motors and engines of all sizes and for all conditions, which we will sell or rent. If you want a complete plant or any part, write us your needs and get our prices. Can give you special low price on engine and automobile oil, also belting. Machinery & Motor Exchange, 733-735 San Fernando street, 732-734 New High street, Los Angeles, Cal. Main 6382.

For Sale—Used and new gas engines, 2 H.p. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild gas engines correctly. Get our prices. Lloyd, 806 N. Main, Los Angeles.

LIVE STOCK

Ohio Improved Chester White (O. I. C.)—Four boars, March farrow left; 8 sows, June farrow, ready next month. Selected sows bred for October farrow; pigs ready to ship December 1st. Three herd boars in use. All stock cholera immune. Booking orders now. Crated and registered free. C. B. Cunningham, Mills, Sacramento County, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor, Mayhews, Sacramento Co., California.

Thoroughbred Berkshire Boars of all ages from developed and large-boned hogs. Riccomi Bros., Mountain View, Cal.

For Sale—Young, registered Berkshire boars; fine, strong stock, weighing about 150 lbs. Stanislaus Ranch Co., R.F.D. No. 1, Crows Landing, Calif.

Glenview Poland China—Stock for sale. Chas. R Hanna, R. F. D. No. 3, Riverside, Cal.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

TREES.

For Sale—One and two-year-old Washington Navels and Valencia Orange Trees. Eureka Lemons and Marsh seedless grapefruit, for Spring 1914 delivery. Write for prices, or call and examine stock at Morris Citrus Nurseries, Cor. Juanita and Valley Center, R. F. D., Box 34, San Dimas, Cal.

Now Is the Time to book your order for fig trees. "My specialty." 25,000. Seventeen varieties, extra fine, well rooted, straight and branched, one and two year old trees. Price list on application. C. C. Terbush, R. 2, Box 543, San Gabriel, Cal.

For Sale—50,000 Sour Orange seed bed stock, finest quality, or will let to responsible party on percentage basis; also 2000 A1 late Valencias, two years old next spring, or might exchange for Washington navels. H. H. Eshelman, Soldiers' Home, Cal.

For Sale—A block of 3000 Valencias, 1000 navel and 1500 lemon trees, grown between orchard rows and must be moved at once. Prices right for quick deal. Also have budded and seedling Avocados. Smith-Roberts Nurseries, Tustin, Cal.

The 1200-Acre Nursery, growers of 1500 varieties of trees and plants. OREGON NURSERY CO. Orenco, Oregon. Sales office, 522 Chamber Commerce, Los Angeles, Cal.

1000 Avocado Seedlings—Pots, also can furnish nice plants, bare root, at low price. A. A. Quint, R. D. No. 2, Pasadena, Cal.

For Sale—Eureka Walnut Trees, budded on Native Black Walnuts. Choice stock. Order immediately. Don't delay. Wm. Holve, Fullerton, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

You Future Nurserymen—Write for prices on special stocks of plants to start business with. Ballou's Nursery, Pasadena, Cal.

Budded Citrus Trees and seedlings at fair prices. Will take auto or land. J. P. Butler, Jr., P. O. Box 145, Lamanda Park, Cal.

SEEDS AND PLANTS

Burbank Spineless Cactus—Robusta, Special and Columbia for forage; Eldorado, Banana, Royal, Sugar, Niagara, Green Fruit, Red Fruit and Opaline for fruit. Write for description and prices. J. T. Green, Box 63, Morgan Hill, Cal.

For Sale—Avocado Seeds (Alligator Pear) at $4.00 a 100; $35.00 a 1000. I also have to offer a few small yearling Avocado trees at $10.00 a 100. J. B. Wagner, Nurseryman, Pasadena, Cal.

$ $ $ $pinele$$ Cactu$—All varieties Burbank's fruiting and forage plants, 10c up. Plant now. Booklet free. Wonderful new Giant Rhubarb. Black Bros.' Nursery, 455 Lucas, Los Angeles. $ $ $ $ $ $ $ $ $

Alligator Pear Plants—Choice Avocado seedlings from Mexican highlands, two to three feet high. J. C. Bosche, 127 South Benton Way, Los Angeles, Cal., Phone 51208.

Thornless Cactus Slabs for sale at 5 to 15 cents each. Chas. R. Hanna, R. D. No. 3, Riverside, Cal.

WANTED.

Wanted—Married man with three small children would like position on ranch. Good milker and teamster. Can do any kind of general ranch work. Can run any kind of pumping plant and can do nearly all kinds of repair work. Would like steady position. Do not drink or use tobacco. D. L. A., care Ostrow, R. F. D. 2, San Diego, Cal.

Wanted—Man with agricultural training and several years' practical experience with dairy and stock cattle, desires responsible position on large ranch. Can furnish best of references as to character and ability. Address Henry Wade, 227 Cottage Grove avenue, Santa Barbara, Cal.

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property Free. American Investment Association, 12 Palace Bldg., Minneapolis, Minn.

Wanted—Steady position by expert in pruning and new style budding and grafting; any kind of trees or roses. Work guaranteed. Mike Detore, 138 South Los Angeles St., Los Angeles, Cal.

Wanted—Active young woman to buy interest in poultry plant at Long Beach, and assist in management. Address Cultivator Box 99.

Wanted—To hear from owner of good farm for sale. Send description and cash price D. F. Bush, Minneapolis, Minn.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

FARM LANDS FOR SALE.

For Sale—640 acres of land 40 miles from Los Angeles; Southern Pacific R. R crosses a portion of the land, 150 acres under fence, 80 acres in crop this year, 10 acres in alfalfa, can cut from five to seven crops of alfalfa per year and will average better than one ton to the acre for each cutting; have had plenty of water on the surface up to the present time, and I have a good pumping plant that will furnish plenty of water at all times; have three good wells, house, barn and other out buildings. I will sell all or a part $25 per acre and up; one-half cash, balance 8 per cent for any reasonable time. Address J. E. Youngblood, Lang, Cal.

VICTORIA, AUSTRALIA, WANTS SETTLERS

Special inducements; government land, railways; free schools; cheap irrigation; 31 years to pay for farms adapted to alfalfa corn, grains, fruit, etc.; climate like California, ample markets, reduced passages, special excursion next November. Free particulars from F. T. A. FRICKE, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

Tires
for
Bad
Roads

PENNSYLVANIA
Oilproof
VACUUM CUP TIRES

—the certain way to assure safety for yourself and for your car on bad roads. These tires are built extra strong and extra tough for the extra demand of hard country use. Their stout, massive, suction cups dig down in the soft mud, preventing many a bad slide. And the sturdy thickness of their tread is proof against the cutting and grinding wear of ruts and rocks.

Guaranteed for 4,500 miles, and averaging nearer double that distance.

Oilproof — through and through. You need never fear the fresh oiled road if you have VC's.

At dependable dealers everywhere.

THE CLIPPER
There are three things that destroy your lawns. Dandelions, Buck Plantain and Crab Grass. In one season the Clipper will drive them all out
Clipper Lawn Mower Co.,
Dixon, Illinois

Household Department

HELLO!

Dont' forget to say "hello!"
When you meet some one you know,
Maybe he's discouraged, sad;
Make him feel the world's not bad
With your cheery, warm "hello!"

We are children, don't you know?
Need the hearts that say "hello!"
Need the faces that are bright,
Need the souls that shed the light,
Need the friends that say "hello!"

When a man can say "hello!"
With his countenance aglow,
So that you can see his heart,
You may steal and use the art,
Imitate his rich "hello!"

—Eugene Secor.

NEIGHBORS

By Ida Alexander in Youth's Companion.

The holdings in the little village were not large. Some had one acre, some two, some three. Few had more. But Silas Green boasted no less than eight acres. Moreover, it was the most fertile and best-kept ranch for miles round. Strangers seldom passed it without remarking on its thrifty appearance. The lawn was always neatly trimmed; the orchard was well cultivated; the fruit trees were whitewashed at just the right time; the house shone without and within. Silas himself was inordinately proud of it. He never drove away without a backward glance; he never drove in without a satisfied smile.

And yet the very excellence with which the place was kept had brought him trouble enough. He could not endure to see other places kept differently. He had quarreled with all his nearest neighbors about the way to do this or to do that. Mrs. Green had remonstrated at first.

"What's the difference, Silas," she would say, persuasively, "about how things are done? 'Tain't as important as good, neighborly feelings."

"I don't like to see slipshod ways, that's all," the old man would remark, and he would shut his lips together.

"But it don't harm you any."

"It does! It does, Henrietta! There's Johnson; his tomatoes are a flat failure year after year. I told him he ought to change his fertilizer, and do away with that black rot they catch. But he wouldn't listen, no, siree! Every year it's the same thing."

"Well, his wife brought me over a bottle of ketchup last year, crop or no crop," said Mrs. Green.

"I reckon you sent her something first, Henrietta," Silas observed, shrewdly. Mrs. Green looked down. "And, besides that, the ketchup wa'n't any good," he added.

"No, but it stood for good and friendly feelings. She hasn't got 'em now. I met her at the postoffice the other day, and she scarcely spoke. I felt just terrible."

"Well, I wouldn't. If folks that need advice are too touchy to take it, and get mad, why, let 'em. I calculate we can about row this little boat of ourn."

So, indeed, it appeared. With such steady, experienced hands to do the rowing, there was small danger of shipwreck.

But as time went on, and the old man's blunt tongue and his habit of giving unwelcome advice estranged neighbor after neighbor, Henrietta Green felt the loneliness of having no neighbors. No one ran in to borrow this or that; no one came over with the first fruits of the preserving kettle; no one came to give or take, after the pleasant country fashion. As far as human intercourse was concerned, she might as well have lived alone on a desert island.

With Silas it was not so bad. Twice a week he made trips over the mountains, to dispose of his vegetables and fruit; every other day he drove to town for the mail; there were many things to break the monotony for him. Sometimes he proposed taking her with him.

"Get into your things and come along," he would urge her. "The ride'll do you good. We can get supper in town, so that you won't have anything to do when you come back."

But his wife never accepted the invitation.

"Some other time," she would answer, "not today."

She could never bring herself to explain to Silas that the cold greetings and averted eyes of her neighbors filled her with a gloom that the exhilarating trip over the mountains could not charm away.

Sometimes she cried from the loneliness of it. At first she had tried to keep her own relations with the neighbors friendly, in spite of the difficulties that her husband's sharp tongue made. But it was of no use. He affronted the men, and the women took up the quarrel. Little by little she was left out of everything.

At last she gave it up and confined herself to her household tasks, but they did not give her capable hands enough to do. Her leisure time she spent idly, sitting with folded hands and looking out over the hills.

By spring she had failed perceptibly. Silas watched her with fear at his heart. He called in the doctor, who laughed at his fears before her, and spoke seriously to him when they were alone.

"She needs waking up, Silas," he said. "The human family is a gregarious one. Give her some good times; get in the neighbors; don't let her be so much alone. 'No man liveth to himself.' Remember that. Now you just give her some rousing good times—or—else—I'm afraid—"

He paused and held out his hand. Silas took it with one that trembled.

"I'll do it, doctor," he said.

And then his face lighted up.

"I have it! I'll give a party!"

"Just the thing," said the doctor.

"But—no one would come," concluded Silas, hopelessly. "I'll do something, though," he went on. "I'll do somethin', or—die—too."

In the days that followed, he did his best. He tried in his clumsy way to persuade her to go driving; he brought her everything he could think of from the store in town. And she thanked him with a smile that moved him more than tears would have done. Silas clenched his hands when he was alone.

"I'll do somethin'." he repeated over and over. "Next week I'll do somethin'."

But he had not reckoned on the frailty of his own body. He came home one day, swaying dizzily. His wife made him lie down, and then changed horses and went after the doctor. When the doctor came, and pronounced the case typhoid fever, the fear on the face of Silas was not for himself.

"What'll she do now?" he whispered to the doctor. "I was going to take her for a trip next week. What'll she do? Will it kill her?"

The doctor shook his head.

"It will probably do her good," he said.

All that day, all that night, all the next day, Henrietta Green went swiftly about the old work and the new. She was worn and tired, as much from anxiety as from the actual work. At last Silas sank into an uneasy sleep, and she sat, half-dozing, by the kitchen fire. A tap at the door startled her.

"Come in." she said.

Mary Johnson entered, and with outstreched hands came swiftly across the floor.

"We've jest heard," she said. "I came right over. Don't you worry a mite. I have a brother who had typhoid once. He was terrible sick, but he pulled through, and he's a well man to-day. Don't you be afraid, Henrietta, and don't cry like that. You must keep up. Johnson's outside. He wants to know where the milk-pail is. And he'll feed and bed down the stock. We'll manage fine. Don't you worry."

Day by day, night by night, the old kitchen door opened to the old neighbors, who rallied round the striken house.

(Continued next week.)

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle.

Breakfast

Halves of Ripe Peaches, Soft Sugar
Broiled Bacon, Fried Apples
Southern Spoon Bread Coffee

Lunch or Supper

Creamed Potatoes Scalloped Salmon
Cottage Cheese Rolls
Apple Dumplings
Coffee

Dinner

Broiled Chicken
Baked Sweet Potatoes
Corn Oysters Lima Beans
Watercress Salad
Apricot Tarts Coffee

Southern Spoon Bread

Three tablespoons melted shortening, two cups cornmeal, one quart milk, one teaspoon salt, three eggs. Heat milk to boiling point, then stir in meal and salt, add shortening and cook five minutes. Cool mixture, add yolks of eggs well beaten, then beat whites of eggs to stiff froth and fold in. Pour batter into greased two-quart pan and bake in moderate oven 45 minutes. Serve hot, using a spoon with which to serve it.

Watercress Salad.

Look over the cress thoroughly, removing coarse stems, wash and place in a cool place until wanted. Make a dressing of hard-boiled yolks of two eggs, mashed smooth, to which add a pinch of salt, one of mustard and a little white pepper. Mix to a smooth paste with vinegar, then add either sour or sweet cream to make the quantity of dressing desired. Add more vinegar if desired. Chop the whites of eggs, add to the dressing and pour over the cress when ready to serve.

Apricot Tarts.

Take an egg, with its weight in crushed macaroon crumbs and fresh butter, a tablespoonful of sugar, a small piece of citron and a little flavoring. Beat up the butter to a cream with the sugar, add the crumbs and eggs, then the flavoring, mixing all well together. Line some patty pans with puff paste, put a small piece of stewed apricot in the center of each and then a thick layer of the mixture. Lay a piece of citron across each patty pan and scatter chopped almonds on either side. Bake for about a quarter of an hour in a quick oven.

Rice and Pimentos

One small can of pimentos, one cup of rice, one cup grated cheese, two eggs, one and one-half cups of milk, salt and pepper to taste. Wash the rice and boil it in plenty of boiling salted water, then drain; add the cheese, the pimentos, first having cut them in small pieces, the eggs which have been well beaten, the milk and the seasonings. Turn into a buttered fireproof dish and bake in a moderate oven for 20 minutes.

MAKING TIME COUNT.

One housekeeper writes that in her younger days she was always considered slow. She says: "When I began a task it took me so long to get through that I frequently became disgusted, and finally determined to try and overcome this natural inactiveness. I began with dishwashing, the most disagreeable task of all. I decided that 20 minutes would be enough time for ordinary dishwashing like mine. But try as I would it always took a good half hour. In a few days, however, persistence won and 20 minutes was sufficient.

"Then I began on sweeping, dusting and so on, taking up the different tasks one by one and allowing myself only sufficient time to do them well without unduly tiring myself. Housewives know that washing and ironing are the hardest tasks in the line of housework. I found that by having all the other work arranged and the minor work out of the way before starting I could accomplish more in a shorter length of time.

"I also learned to keep my mind on my work and not build air castles. In this way I overcame my slowness, and now even the dishwashing has no terrors for me. There are many others who can profit by my example, not only in their work but in changing clothes, reading, writing, etc. There is no necessity of being slow."

NOT FOR DONALD

Sandy and Donald were discussing the domestic infelicities of a mutual friend.

"Ay, ay," said Sandy. "Jamies Thompson has a sair time wi' that wife o' his. They say they're quarreling."

"What else can ye expect?" was Donald's scornful retort. "The puir feckless creature marit after courtin' for only seven years. Man, he had no chance to ken the woman in sich a short time. When I was coortin', I coorted for 20 years!"

This little dialogue took place on a railway journey, and in the further corner of the compartment sat an Englishman, listening and much amused.

"And may I ask," he inquired, "if connubial bliss followed this long courtship?"

Donald looked at him reproachfully.

"I tell ye I coorted for 20 year," he said, "and in that time I kent what woman was, and so I didna marry."

GOOD REASONING

Little Willie's mother had made him a fine new pair of knickers, but the little boy complained that they were uncomfortably tight. "They're tighter than my skin, mummie!" he declared. "Don't be silly, dear," remonstrated his mother. "They can't possibly be tighter than your skin." "But they are, mummie; because I can sit down in my skin, but I can't sit down in these trousers!"

A SOUTHERN "BLACK HAND"....

The Florida Times-Union gives the following:

Mrs. Collins found the following Black Hand letter pinned to the door one morning:

"Deer Mis Collins—Onless you put a jar of jam, a hunk of chokolit cake, a apple pie an' a bag of candy down by the old well, we will steel you little boy and keep him, onless you pay up a millyon dollars."

SAME HERE

Little Jack Stout was visiting a ranch and was out at the barn one morning watching his uncle feed the horses hay. It troubled him to see them given only dry hay and oats. Finally he said in a tone of sympathy: "Never mind, old horsies, we have to eat breakfast food ourselves."

"RIGHT-O, RASTUS"

One morning, when the senator was wandering over the farm, he came upon his man feeding the chickens. Rastus stopped him with:

"Good mawnin', suh! I been thinkin' this mawnin', and I made up my mind, suh, as I's lookin' at these heah chickens, that they's the usefullest animal they is. You c'n eat 'em 'fo' they's bo'n, and aftah they's daid!"

Meals on Time

A good oil stove gives full heat just as soon as it's lighted. There's no waiting for the fire to catch up or the oven to heat. Meals can be started later and still be served right on time. That means less work and less time in the kitchen.

New Perfection
OIL COOK STOVE

burns kerosene, the clean, cheap fuel and gives an intense heat that can be regulated just as you want it. It does all sorts of cooking and baking just as well as a wood or coal stove—and without tainting the food. Don't cook in a hot kitchen this summer. Don't lug coal and wood and ashes. Get a New Perfection. It saves all this trouble and it's economical, too. Ask your dealer for the New Perfection.

Standard Oil Company

Acetylene Ranges For Quick Cooking In Country Kitchens

You housewives in the country who labor over hot stoves cooking big meals for hungry families—how would you like this convenience, which every city woman enjoys?

How would you like to do your cooking on a gas range?

How would you like to turn on your gas with a twist of your wrist—turn it up or down just as hot as you want it.

If you have ever been in a city kitchen you know how much such a range will shorten your cooking hours and relieve you of the trouble and work of handling kindling, coal and ashes.

You also know what pleasure and comfort your household will derive from brilliant Acetylene lights throughout your house and barns. To date this convenience — Acetylene for Lighting — Acetylene for Cooking — has been supplied to over 250,000 country homes.

Pilot Acetylene generators are today the most widely sold light and fuel plants in the world.

The Pilot is extremely simple to operate. You simply fill the generator with water and Union Carbide about once a month. The machine then works automatically without further attention.

It feeds the gas it makes—genuine Acetylene—direct to your kitchen range, and to stationary light fixtures, yielding handsome, brilliant, white light throughout your house and all the barns and outbuildings as well.

HAY

Under date of August 1 Scott, Manger & Miller say:

Receipts of hay during the week were 4315 tons; last week, 3100 tons. Very few consumers are laying in quantities as yet for winter use. Producers continue to make strong efforts to dispose of their crops, but very little hay is changing hands in the country districts. Choice varieties of hay are extremely scarce to date, and arrivals of this are disposed of quite readily. Arrivals of alfalfa have been light, but as there is little demand at present prices remain the same. Arrivals of straw have been light.

We quote the average wholesale prices on carload lots of new crop hay on today's market as follows:

Fancy Wheat Hay, lt. bales	.11.00@12.00
No. 1 Wheat or Wheat and Oat	.9.00@10.00
No. 2 Wheat or Wheat and Oat	.7.00@8.50
Choice Tame Oat	.10.00@11.00
Other Tame Oat	.7.00@9.00
Barley	.6.00@8.00
Wild Oat	.6.00@8.00
Alfalfa	.6.00@9.00
Stock Hay	.4.50@5.00
Straw, new	.40@45

GRAIN

Wheat, Cal. Club	.1.55@1.57½
Corn, Eastern Yellow, blk	.1.70@171¼

Linseed Oilcake Meal	27.00@28.00

Citrus Fruit Market

LOS ANGELES, Aug. 5, 1914.

With about 70 cars going forward daily the market is generally in a good condition. The quotations yesterday were about the same as formerly, but a slightly easier condition obtains. War talk has in no way affected the market.

The eastern seaboard is still supplied with great quantities of imported stock, but a reduction in receipts is anticipated because of shipping conditions. Good prices are obtained for California stock in the Middle West.

Shipments.

Shipments of oranges from Southern California to date since November 1, 1913, 34,014 cars, lemons, 2,477; total, 36,491. To same date last season: oranges, 12,460 cars; lemons, 1,900; total, 14,360. Total of citrus fruits two years ago this date, 32,365.

NEW YORK, Aug. 3.—Nineteen cars Valencias, three mixed cars sold. Market slightly easier on Valencias. Fair and warm.

This schedule is recommended for use when treating trees infested with **Coccus Citricola (Soft Gray Scale)**, sometimes mentioned as False Soft Brown Scale, Longulus and Coccus Hesperidum.

This is the dosage schedule used successfully in the orchards of Tulare County.

DOSAGE SCHEDULE 110 % A, FOR HIGH GRADE SODIUM CYANIDE (IN OUNCES).

THE ABOVE SCHEDULE IS FOR R. & H. C. CO. 129% SODIUM CYANIDE, AND IS CALCULATED ON THE BASIS OF ONE OUNCE OF 98-99% POTASSIUM CYANIDE TO THE 100 CUBIC FEET.

FUMIGATION SUCCEEDING

(Continued from Page 126.)

may be perfectly understood: "The 85 per cent dosage being used in Tulare County is 85 per cent of 129 per cent sodium cyanide and not 85 per cent of Schedule A. This 85 per cent dosage, calculated into the Woglum system, figures 110 per cent of Schedule A., sodium cyanide."

Regarding the work done, Fred P. Roullard, commissioner of Fresno County, wires:

"Fumigation experiments and demonstrations at Mount Campbell show up well. I have examined 20 of the 25 trees treated and every tree examined appears to be a complete kill of Coccus citricola. Very little injury to the trees has shown up so far; no injury whatever when fumigated with dosages of sodium cyanide of 105 per cent or under."

Fresno County is awaking to the fact that thorough work must be done and is using a dosage of 75 to 110 per cent of the Woglum schedule A.

One fumigator writes: "I have made five different settings and all look good to me. The scale all seem to be killed."

CURED FRUIT BULLETIN

SACRAMENTO, July 26, 1914.

To Members Affliated Associations: At the meeting of our directors held in Sacramento on the 14th inst., two things of unusual importance and interest to members were accomplished. Not the least important of these was the selection of a general manager. Months have been spent seeking an available man who seemed to best combine the attributes essential to a successful manager.

The directors feel that in Henry M. Ellis, whom they have unanimously chosen as your manager, they have secured the right man. His more than twenty years in the fruit business has made him friends from north to south, has won the good opinion of the business world and the confidence of banks. His enthusiasm and sound judgment taken together will certainly place our undertaking well forward in the dried fruit industry.

Another event of more than ordinary interest to our members is the announcement of the fact that we have outgrown our present quarters and that within the next 30 days we expect to move our headquarters to San Francisco and assume our proper position among the dried fruit shippers in the center of dried fruit interests.

The opening of another dried fruit season impels us to remind growers that careful, conscientious work in the cutting shed and on the drying ground pays good dividends to growers who insist on having things done rightly. Remember that fruit cut too green loses in both weight and color. Insist that halves be completely separated by cutters and laid on the tray with pit cups straight up. Culls and windfalls should be kept separate from well ripened and well colored fruit, as mixing them in can only reduce the quality, grade and price of the whole lot. Black or dark colored pieces should be removed at time of taking fruit off the trays, as it can be done more cheaply and quickly then.

We have to tell you that the selling market on both apricots and peaches is lower—peaches especially. Some packers reported offering new crop peaches as low as bulk basis, Standard 3½c; better grades at proportionate prices, which will amount to not to exceed 3¼ to 3¾c, orchard run, to growers. We believe that these sales are being made short by speculative packers, because we don't believe that any growers have yet, sold peaches as low as packers will have to buy to resell at prices above stated. We surely don't advocate selling peaches so low because we well know that growers cannot produce peaches with any profit, even when as good a crop as this year, to sell at much below 5c, orchard run.

You may remember Mr. Dargitz' bulletin of June 9, 1913, in which he well stated the cost of producing five tons of Muir peaches green, to the acre, or one ton dried, to be fully $98.75, or practically 5c per lb. We will be glad to send copy of this last year's bulletin to any member or non-member who cares to see the figures on cost of producing one ton of dried peaches. We are not sure, with the large crop of peaches and other fruits this year, both in California and other states, that we will be able to get our growers an average of 5c for dried peaches, but we and every member should do all possible to get a decent price for peaches, and advise outside growers to try to do the same by holding for above 4c for their crops; advise your neighbors who are not members against selling their peaches too low, if they don't want to play into the hands of short selling speculators, who will make their profit on peaches regardless of the growers' loss, and it is only the growers' fault if they play into such hands.

We have sold half or more of the peaches our members will have this year, mostly for August-September shipment, at prices well above the present market, so are in a strong position for giving our members and others who may come to us good returns for their peaches, compared with what outside growers may get.

We also are in a strong position on apricots, prunes and raisins, a good quantity of which are well sold at prices rather above today's market, and have well established the fact that co-operative marketing is the right thing for our Californit fruit growers.—California Cured Fruit Exchange.

THE FINE ART OF FEEDING

(Continued from Page 137.)

growing feed and almost equally good as a laying feed. I steam rolled barley for my young chicks, filling a kettle two-thirds full, covering it with water and allowing it to come to a boil. After it has cooled it is eaten eagerly, sometimes by chicks a week old, and I have yet to see any bad effects from it.

At the Bandini Poultry Ranch I saw large quantities of whole barley being prepared for the evening meal of 1900 hens. The barley is soaked 12 hours in a tub of cold water covered with burlap, then taken out into shallow boxes about the size of a cherry box, only deeper, where it is left to drain for 24 hours, covered carefully to keep it from drying out. At the end of that time it is plump and moist, altogether more suitable for a scratch food than the rolled barley, and when mixed with a little wheat and whole corn it makes a mixture which Mr. Suits says is as good as anything he ever tried.

This is just an example of what may be done by a little thought to cheapen the ration. Sometimes it is possible to buy broken rice, cracker waste or stale bread so cheaply that it makes a material saving in the cost of the ration. Those who have sour or skim milk or who can buy it cheaply can save the expense of beefscrap, and there is nothing better for either laying or growing stock.

Why We Bought Milford Valley Lands

A Few Extracts from the Letters of Recent Buyers

"I covered 10,000 miles of country in my automobile, searching for the best farming advantages for the least money—I bought 160 acres in Milford Valley."
J. C. BELSHE
(of Missouri).

"After having investigated the best farming sections of Washington, Idaho, Wyoming, Montana, Colorado, New Mexico, Texas, Arizona and California, I have located in Milford Valley on land which I think is far superior to anything I have seen in any of the other sections."
J. H. DORAN
(Rialto, Cal.)

"My advice to the man who wants the best for the least money is—'Come to Milford.'"
D. S. STAMY
(of Iowa).

"I have found conditions that embrace everything I was looking for in Milford Valley. It's the place for me—and I want my friends to come."
LELAND S. BONHAM
(of Los Angeles).

(Extract from Western Union (Night Letter.)
"Your project is fully as good as represented. We have found extra good land, equal to best soil in the Imperial Valley. This land should be worth $200 an acre when in alfalfa."
ED RALSTON, JOHN BARRON, L. M. VAN HORN,
W. P. DOWNER,
(of Imperial Valley).

"This is the best land and water proposition I have ever seen. I am going to sell my farm and buy 160 acres in Milford Valley."
G. A. HALSTEAD
(of Whittier).

"We saw wonderful stands of alfalfa in Milford Valley which had not been replanted for 45 years. It's a great country."
FRED OUTLAND and
D. A. WEBSTER
(of Santa Paula, Cal.)

"You haven't stated all that you could have truthfully said in your booklet in favor of the Milford Valley project.
JOSEPH E. BENTON,
(Holtville, Cal.)

"My young son produced 800 bushels of potatoes to the acre on my land—netting $484."
HEBER GILLINS
(Who has been in this section for forty years).

"This is the land for men who want to make money."
W. B. WOOD
(Who has been in this valley for fifty years).

The Milford Valley project has been on the market a little over two months and this fertile $30 an acre land has been purchased by Southern California's most practical ranchers and thoughtful investors. Nearly every man who has visited the valley has bought as much land as he was able to buy RIGHT ON THE SPOT. So enthusiastic are these purchasers that they gladly wrote testimonial letters, and extracts from a few of the many are reproduced herewith. The complete letters are all on file in our offices and any prospective farm land buyer can read them upon application.

$30 an acre Adjoining Milford, Utah—on Main Line of Salt Lake Railroad

Perpetual Water Right $70 a Share—12 Years' Time to Pay for It If You Wish

The advertising of Milford Valley lands differs from any farm land advertising heretofore published, in that it consists principally of the statements of OUR OWN BUYERS. They are so pleased with their purchases that they are willing to have us publish their letter over their own signatures, accompanied by their pictures! Could stronger evidence of the desirability of a farm land offering be asked for?

But we want YOU to see for yourself—go and be convinced. Go and see the best Valley in the West—land that is being offered at a fraction of its real value. See land that should be worth $250 an acre when in alfalfa. Enjoy the glorious mountain air. As one visitor said, "This is surely God's country." Drink the pure soft water. See the great gravity irrigation system. See the bumper crops of grain, alfalfa and fruit. Write for booklet giving facts, figures, crop records, etc. Don't overlook the most unusual farm land opportunity of the last ten years.

INDEPENDENT of the WEATHER

The Farm that is equipped with the

Waterloo Boy Engine AND THE Woodin & Little Horizontal Centrifugal Pump

is not at the mercy of the weather. No matter how hot, cold or dry it may be, no matter what the conditions, this engine and pump will work steadily and well. And backing up the long and continuous service which this pump and engine will give is the intelligent and cheerful personal service which the **Woodin & Little Pump House** extends to all its customers.

Whatever is needed in the pump line you may be sure we have it. Whatever is purchased from us you can rest assured is of the highest quality.

Those wishing detailed descriptions of the pump and engine here illustrated together with catalogue of the big line of

Pumps for Every Service and Use—Gasoline Engines—Wind Mills—Pipe-Casing—Fittings—Brass Goods, etc.—can have it free of charge. Address:

WOODIN & LITTLE—PUMP HOUSE
33 to 41 Fremont Street San Francisco, Cal.
We carry the largest line of Pumps in the United States.
Call upon your nearest dealer for our proposition.

One idea—a new one—that of fitting a ball bearing to a tractor drive wheel, forms the foundation of The Yuba Ball Tread Tractor.

On that foundation is built a machine which embodies other ideas—some new and some not—some taken from tractors, some from automobiles and motor trucks, and some developed by the designers.

THE YUBA BALL TREAD TRACTOR

In The Yuba Ball Tread Tractor these ideas are combined to produce an ideal machine for farm and general road work—powerful, compact, dependable, easy and economical to operate; able to turn in an orchard row, in the bottom of an irrigating ditch, on top of a levee, or in a narrow roadway; usable to prepare the land in Spring, operate the pumps to irrigate in Summer, harvest the crop and haul it to market in Autumn.

There is a booklet telling how.

How the Bell System Spends its Money

Every subscriber's telephone represents an actual investment averaging $153, and the gross average revenue is $41.75. The total revenue is distributed as follows:

Employes—$100,000,000

Nearly half the total—$100,000,000—paid in wages to more than one hundred thousand employes engaged in giving to the public the best and the cheapest telephone service in the world.

For Supplies—$45,000,000

Paid to merchants, supply dealers and others for materials and apparatus, and for rent, light, heat, traveling, etc.

Tax Collector—$11,000,000

Taxes of more than $11,000,000 are paid to the Federal, state and local authorities. The people derive the benefit in better high ways, schools and the like.

Bondholders—$17,000,000

Paid in interest to thousands of men and women, savings banks, insurance companies and other institutions owning bonds and notes.

Stockholders—$30,000,000

70,000 stockholders, about half of whom are women, receive $30,000,000.

(These payments to stockholders and bondholders who have put their savings into the telephone business represent 6.05% on the investment.)

Surplus—$12,000,000

This is invested in telephone plant and equipment, to furnish and keep telephone service always up to the Bell standard.

Continuous Clean Cultivation Destroys Humus

Fertility of Soil Depends More on Physical Condition Than Upon Elements it Contains. No Matter How Rich a Soil May be Chemically it Must Have Vegetable Mold or Humus to Encourage Bacterial Action and to Serve as a Moisture Holder

"Many thousands of tons of commercial fertilizer have been and are being applied without evidence of any appreciable effect upon yield or quality of crops, simply because used upon soils deficient in organic matter."

The above, which is from "Fertilizers and Crops" by Van Slyke, is so well said and so emphatic that we use it for the text for the special articles by practical growers the state over. We believe that disappointment has come to many California orchardists because the application of commercial fertilizers has shown no results. The elements required by the plants have been added to the soils, but the physical condition has been such that it has been impossible for the rootlets to absorb the nourishment they needed. For some years we have been growing cover crops, or green manure crops, using legumes almost entirely because of the fact that they are hospitable to nitrogen gathering bacteria. Without doubt this practice will be continued for many years, but the more we study the subject, the more we are convinced that the addition of humus to the soil is a far greater factor in productivity than the securing of nitrogen. Humus is absolutely necessary if we would grow crops.

But What is Humus?

Loughridge says: "The name humus should not be applied to all of the vegetable matter of the soil in all stages of decay, as many seem to think, but only to a peculiar product of partial decay of vegetable and animal matters brought about under conditions of moisture, warmth, a limited amount of air, and in the presence of lime. Until humification of the leaves, roots and other plant debris takes place the beneficial effects of humus itself are not obtained, and the material, while loosening the soil (sometimes injuriously), is practically inert as far as enriching the soil with its nitrogen and mineral elements is concerned."

If this result is essential to the securing of crops, it is little enough that the Cultivator should give at least this one issue almost entirely to the discussion of this one subject. We have asked many who have experimented in producing humus to give us of their experience.

* * *

First we refer to an address recently delivered by Mr. W. M. Mertz of the California citrus experiment station. Mr. Mertz is a thorough believer in the use of legumes which will add not only humus but nitrogen, and he also believes that as a rule, if care is exercised to secure a legume well adapted to the section, as much humus will be added by legumes as by non-legumes.

Mr. Mertz Said:

"As high as 20 tons of green material has been grown upon an acre, however, 10 to 14 tons is nearer the average. By this I mean tops, not including the roots. From observations made by the university I place great faith in Melilotus indica, or common yellow clover, which is an annual. The nitrifying power of melilotus is exceptionally high, far higher than that of alfalfa even. One of the very best of humus producers is a non-legume, the common malva which grows almost everywhere on the better soils of California. As a rule the vetches are not so well received as formerly. The purple vetch, however, has proved exceptionally fine for some sections. At present it is not possible to get purple vetch seed in any quantity. The common field pea is used very extensively but will not stand trampling.

Humus

Humus is essential but its value is not as fully recognized as it should be.

Humus improves the texture of soils—it makes heavy soils lighter and more easily cultivated, warmer and more receptive to rainfall. It makes light, sandy soils far more retentive of moisture.

Humus promotes chemical action in the soil—it acts directly upon inert and insoluble minerals and affords a medium in which nitrifying bacteria operate.

Humus absorbs air and water.

Humus largely prevents the crusting of soil surface.

Humus contains nitrogen and is a nitrogen fertilizer. Humus contains soluble mineral plant food.

Humus, like all organic substances, may be destroyed by direct decay through exposure to hot, dry air. Humus is not in as great supply in California soils as it should be.

Humus is hard to get and probably more expensive than the chemical elements which plants require. Locality and conditions are to be considered in planting a cover crop.

Humus can be restored to soils if the farmer wants it badly enough to go after it. Use manure, cover crops, alfalfa hay, straw, weeds, shavings, sawdust, brush—anything—but get humus.

"A mixing of legumes and non-legumes is sometimes advantageous, for weather conditions may prevent a heavy crop of the legume and the hardier non-legume may overcome adverse conditions and give a mass of vegetable matter to turn under and thus benefit the soil by the addition of humus.

"In seeding use a large quantity, for while the preparation of the land be carefully done, the furrowing to permit irrigation or the failure to get all seed at proper depth, may materially reduce the product. It never pays to economize on seed of a cover crop. With melilotus and practically all the other legumes inoculation is not necessary in most California soils.

"One favorable feature of Melilotus indica is that it gives a large quantity of woody fiber and at the same time a large quantity of lush green foliage. Care must be exercised in the use of too great a quantity of dry woody material at one time. Cellulose is a factor in stopping rather than accelerating nitrification. Melilotus and bur clover together make a most satisfactory crop."

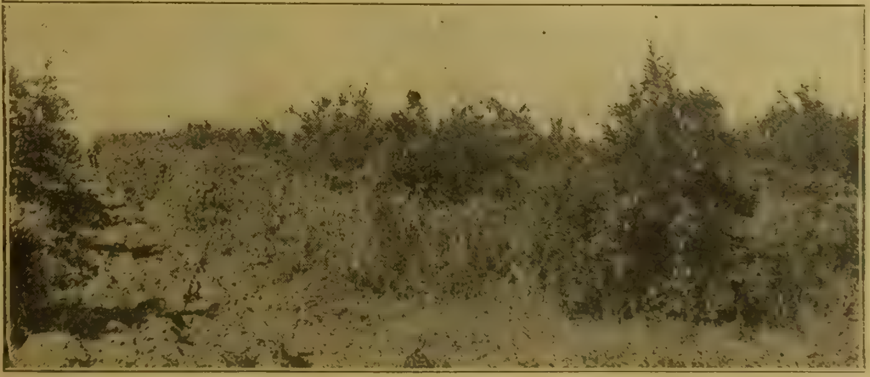
As to the economy or cost of cover crops, Mr. Mertz thinks that cover crops are cheaper than clean cultivation the winter through. The cost of seed and irrigation is more than equalled by the cost of continued cultivation the winter through.

Yield.

The yields of various crops observed by Mr. Mertz are given in the following table:

Average yield of green tops per acre. Average covering 5 years.

	Pounds	Tons
Purple vetch (one year only.)	36,699	18¼
Tangier peas	28,049	14
Barley (two years only)	27,334	14
Melilotus (four years only.)	25,916	13
Fenugreek	25,312	12¾
Bur clover	24,188	12
Lentils	24,090	12
Vetch (new ervilia) (four years only.)	23,107	11½
Vetch, common	22,960	11½
Rye (one year only)	21,766	11
Canadian field peas	18,169	9
Alfilaria (one year)	10,000	5
Average legumes	24,616	12¼



Humus Formers Grown in Tulare County

This is the orchard of which Mr. Brown speaks, the growth being vetch and native wild oats. This combination seems to give a far better growth of vetch than where it is planted alone.

The value of cover crops to the succeeding crop is shown by the following percentages of increase. The study of this table will show the reason for Mr. Mertz's preference for melilotus.

Average percentages of increase for various crops covering work of past four years:

Following cover crop or nitrate of soda.

Tangier peas	67.5
Melilotus clover	66.4
Canadian field peas	51.7
Nitrate of soda, (1080 pounds)	49.8
Vetch, ervilia	31.8
Fenugreek	30.7
Nitrate of soda (540 pounds)	29.7
Bur clover	27.2
Lentils	27.1
Nitrate of soda (810 pounds)	20.2
Vetch (common)	15.5
Nitrate of soda (270 pounds)	8.8

In addition to the above we would refer readers to the California Cultivator of January 4, 1914, in which a more extended discussion of cover crops is given by Mr. Mertz.

* * *

In referring to cover crops in Tulare County we have the following from

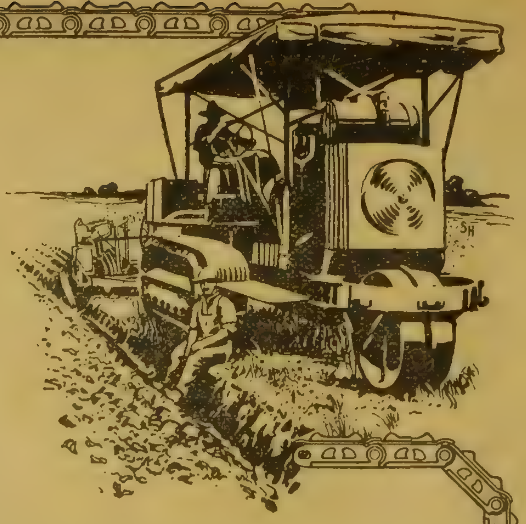
Chas. F. Collins, Tulare County Horticultural Commissioner

Cover crops in this County are confined almost entirely to the citrus district. Probably 75 per cent of the citrus orchardists grow winter cover crops, mostly of vetch and fenugreek, though some use rye and other grains. A small per cent (perhaps 25 per cent) grow summer crops, mostly beans.

Another Tulare County man writes of a cover crop, illustration of which is shown on this page.

C. T. Brown, Lindsay.

"This crop was vetch, about 50 pounds to the acre, held up by a growth of wild oats, which I never tried to eliminate from the grove. The vetch was sown in September and cultivated in with three-inch teeth, once over, not harrowed; furrowed six furrows to the middle, the water being turned on and when I finished the 10 acres, would start over again, till last of October, when rains kept it wet from then on. I should say the crop would go not less than four tons to the acre, probably more. (Probably Mr. Brown means four tons per acre of orchard, much of the space occupied by trees, not covered by vetch.—Ed.) It was plowed under between February 17 and 25, using a mold board plow and a chain to hold the growth in the furrows, not harrowed. It lay this way till the fore part of May, before irrigating, on account of pump troubles. Then furrows were made with mold board plow. We found the ground quite moist, even though the weather had been dry and warm with no late rains. Later the ground was harrowed and cultivated, and is now in fine condition, taking the water well. There seemed to be no trouble in cultivating; the material seemed well decomposed.



Plow Deep

Deep plowing takes *concentrated* power. The Caterpillar not only has plenty of power, but *it delivers it at the draw bar.* The long, wide tracks get a sure grip on the ground. There is no waste from slippage.

CATERPILLAR
Reg. U.S. Pat. Off.

Every ounce of power goes into the "pull"—so the Caterpillar can plow deep, and yet pull a wide enough string of plows so there is no side draft, even in dry, hard-baked ground. In most California soils it plows its own width or more.

Now is the time to figure on your fall plowing and the equipment you need. We have the complete outfit for you—Holt disc and moldboard plows—and the Caterpillar to haul them. Let us send you literature describing the entire line. Write today for Catalog B-57.

Everything for the power farmer—harvesters, disc and moldboard plows, harrows, scrapers, supplies and lubricants.

YOUR COWS
Need Nourishing Butter Producing Economical Feed

Messrs. Willits, Patterson & Green, June 18, 1914.
343 So. Hill St., Los Angeles, Cal.
Gentlemen:
In response to your inquiry as to the desirability of Cottonseed Meal as a food for cattle, we beg to advise that we killed a large number of cattle last winter and during the early spring months that were fed on cottonseed meal. The quality of the beef proved quite satisfactory and the percentage of yield compared to live weight was very good. We believe it to possess very valuable qualities for the fattening of live stock.
Very truly yours,
THE CUDAHY PACKING CO., R. Scott, Manager.

FEED COTTONSEED MEAL and HULLS

According to Government investigation this feed contains more digestible protein than any other. Cows like it——horses thrive on it—hogs fatten on it—chickens lay more eggs on account of it.

ECONOMICAL — EASY TO FEED

Send for interesting booklet. It tells how to feed it and gives a complete treatise on its many uses.

As to frosts there may be a possible warning in the observations of another Lindsay gentleman, Mr. Montague White. He reports that one orchard just west of Lindsay, which showed the greatest injury from cold weather, was one in which an immense cover crop was growing. As to condition of trees in that orchard, that is, as to whether they had sufficient moisture or the cover crop had taken all the moisture from the soil and the trees were suffering, we have not been able to learn. But this suggestion is worthy of consideration, for if cover crops are grown in citrus orchards we believe there should be greatest care exercised to keep the soil well supplied with moisture.

* * *

Wm. Wood, Horticultural Commissioner, Los Angeles County.

Cow peas for a summer crop have proved very successful in the Rivera district. This crop must be grown in summer, as it will not stand frost, and should not be tried unless the grower has abundance of water. Cow peas do best sowed in rows about 3½ feet apart; this gives plenty of room to irrigate and cultivate. The crop can be plowed under green or dry, and, if thought necessary, the peas can be harvested and the vines turned under; having abundance of time to decay and mix with the soil before the late winter or spring plowing commences.

Many Whittier citrus growers favor buying stable manure in preference to planting cover crops. The reason given by several prominent growers is that it is in the way all through the picking season; it gets badly tramped down by the pickers and teams that haul the fruit out, and often is difficult to plow or disk under when the ground becomes hard, which is often the case; and some say that there are times throughout the winter when they would like to work their ground, but cannot when cover crops are growing unless they destroy the crop before there is enough to do any good; and others claim if the cover crop is plowed under too green it sours the land. All admit that it is only a matter of time before they will have to depend on cover crops, but as long as they can get stable manure for their orchards at a reasonable rate they will use it in preference to cover crops.

* * *

Shavings and sawdust have been referred to as offering possibilities for humus making. A warning is necessary here, however, for we recall seeing a few years ago at Alhambra a streak of yellowed trees through a very thrifty orchard. The color of this block of trees was most pronounced, and inquiry was made of the owner as to the trouble. He said that so far as he knew it was caused by shavings, a deep layer having been placed over the soil in an experiment to find out whether as a mulch and later as a humus-former it would prove satisfactory. The shavings were fresh from the mill and this doubtless was the cause of the injury We have never heard of shavings or sawdust from pine or other trees proving injurious. However, these materials should be used with caution. Of course such material will require years for reduction to humus. On this point we call attention to a photograph of shavings being used experimentally in the Limoneira orchards at Santa Paula. On this point we have from

C. C. Teague, Manager Limoneira Orchards.

The shavings that we are using in our groves are used purely in an experimental way and we would not think of using them in general practice until it has been tested out. I would not consider it advisable to mention shavings as a means of getting humus until they have been pretty thoroughly tested out, as there is a possibility that injury may result. The only means I know to secure more humus in the soil is cover crops, stable manure and straw.

* * *

Some growers have used a cutter similar to an ensilage cutter to work up prunings from orchard into small pieces, turning these under to decay. To the limited extent to which this has been tested no harm has resulted and some orchardists have felt that there was sufficient benefit to justify the work.

* * *

P. J. Dreher, Pomona.

I believe the planting of leguminous crops where they can be grown to be very beneficial and the cheapest way of securing humus and nitrogen.

Where straw can be secured at reasonable prices and worked in the ground, without too seriously interfering with the work of irrigation, I think that should be done. I prefer straw plowed in, but any soft soil may be disked to equal advantage. If the straw were available I should prefer to apply it in the fall months for early winter so as to get the benefit of the winter rains to decay it.

I believe no one should allow any vegetable matter of any kind which is available at moderate cost to go to waste in the neighborhood of his ranch until it is in such condition that no more material of that kind can be used on it.

* * *

W. H. Doty, Los Angeles.

As the citrus trees have three separate and distinct periods of growth, February, May and September, each apparently for a different purpose, it has always been my plan to help them along by using a complete fertilizer in the early part of February, May and September.

The September growth, being the heaviest of all and the one in which the most can be done to help the sizing up of the fruit and also prepare the tree for a better crop the next season, I always apply a good complete fertilizer in the early part of September and at the same time put in some kind of a green crop, where the trees will admit.

I find that vetch and barley do the best for me, applying 50 pounds of vetch seed and 15 to 20 pounds of barley per acre.

It is unnecessary to say that a good deep seed bed is always essential. Putting in the green crop early and at the time of applying the fertilizer, I am always assured of a good green crop, one that can be plowed under early in January and have the ground in good condition, well supplied with yeast that encourages the growth of the bacteria that fills the ground with humus, all ready for the trees when they start the spring growth early in February. In that way I feel that the spring buds get a better start, make a better bloom and set a better crop. There is nothing better than stable manure in the right place (which is under an orange or lemon tree) but it is a matter of cost.

Securing Humus

General Discussion of Methods of Securing Vegetable Mold or Humus for Soils.

Written for the California Cultivator By Carrol B. Smith, Redlands

The necessity for humus and its importance to agriculture increase with time and the continued use of land. Especially is this true where irrigation and frequent cultivation are practiced. Both favor the rapid consumption of humus which is removed by the very large crops resulting from intense cultivation. And as humus, with its various activities and functions, is the very life of a productive soil, it must be consistently renewed.

When the agriculturist speaks of humus he refers to the total amount of organic matter in his soil in all stages of decay. Usually he has in mind such materials as stable manure, straw, damaged hay or the volunteer growth of weeds which he plowed under, etc.

When the chemist of the laboratory speaks of humus he means only a portion of the total organic matter—that portion which is soluble in a weak solution (four per cent) of ammonium hydroxid. The chemist's definition has reference to that part of the organic matter so far decayed as to be available to plant life, while the farmer's definition includes all the organic matter—decayed or not decayed——available and potential. The term "humus" as used in this article will refer to the total organic matter of the soil.

Action of Humus

The chief benefit derived from humus is the improved mechanical condition of the soil. Cultivation is easier and cheaper. The moisture holding capacity is increased. A soil rich in humus is more friable, of finer texture and does not bake easily. Without this improved mechanical condition of the soil all the operations of the farm become expensive and uncertain. Cultivation cannot be so thorough and must be more frequent. Root systems are not so deep. Slight drouths affect the crops. The soil has no life and cannot resist unfavorable weather conditions. Under such conditions the returns are less and the expenses greater.

The second chief function of humus is to supply the needed nitrogen. No humus, no nitrogen, is a cardinal principle in all farming. All nitrogen comes from some form of organic matter. Even the Chilian nitrate beds are supposed to be the result of former deposits of organic materials.

Besides these two functions just given, humus is essential because it creates a more uniform and warmer temperature in the soil. Successful crops are very dependent on warm, even temperatures. Then there is the process of nitrification and the formation of carbonic acid which makes soil moisture what it should be and enables it to make the naturally insoluble forms of plant food available. There are other factors of fertile soils dependent on a good supply of humus.

Humus Materials Obtainable

There is no substitute for humus; so we ask what is the cheapest and best way to get it? Common practice in some of the best cultivated sections of the country has answered the question for the time being. But more attention must be given this subject in the future. More area is needing humus every year and the supply today is not unlimited. I believe the citrus experiment station at Riverside will have new and important data on this subject in the near future and it will not be too early by the time they get it.

The most popular and cheapest sources of humus today are the leguminous cover crops grown in our orchards in winter. These include the Oregon winter vetch (Vicia sativa), the hairy vetch (Vicia velosa), and the Canadian field pea. The southern cow pea, really a bean, is gaining favor as a summer cover crop wherever sufficient water can be had, but on this account will not come rapidly into use. It is too subject to frost for winter use.

Besides the legumes mentioned, refuse straw (threshed) and damaged hay, including first cutting alfalfa (with its foxtail), are in very common use.

Vetch and Peas

These are members of the large and widely distributed family of legumes or pod-bearing plants. They alone of all plants are best able to thrive in soils devoid of nitrogen, as they derive their nitrogen from the air during their growth. For this reason they are preferred to the non-leguminous plants such as barley or rye. The grain crops do not add nitrogen to the soil though their root action is doubtless as beneficial as that of the legumes and their tissue makes humus. Of the two vetches mentioned the Oregon winter vetch makes the best winter growth in citrus orchards and can be turned under earlier in the spring or even the latter part of January when winters are favorable. But the hairy vetch grows only while the weather is warm. The seeds of either variety are planted in early fall, say August 15 to October 15, and both do well while warm weather lasts. But the Oregon vetch will make good growth during the colder months. The hairy vetch remains semi-dormant until the warm weather of March and April when it shows great vigor. The Oregon or Sativa vetch is for this reason better than the hairy vetch (V. velosa).

There are at least two other varieties of vetch that promise a larger tonnage of green matter than any now in common use, but the seed supply is not yet available for general use. I refer to the Ervillea and Attropopurea varieties. The Daisy carpa is also very promising.

Cost of Seed

The price of seed is often an important factor. The German seed (imported) is nearly always cheaper than the American product but has a lower percentage of vitality. The Oregon crop is occasionally damaged by drouth so that the seed does not fill out well and the supply is so shortened as to raise the price. The usual price this season is $3,50 to $4.00 per 100 pounds, using 25-50 pounds per acre, the larger amount where trees are small and the whole ground covered. It is advisable to use plenty of seed. The average citrus orchard

CITRUS TREES

Ranchers, Dairymen, Fruitgrowers and Investors

Are you looking for the **Best**—Absolutely THE BEST—conditions to be found in all California? Nothing like it anywhere else in all the State. Read and reflect—then write us for further information and full details.

Abundant and good irrigating and domestic water, all you want, when you want it, as you want it, any hour of day in the year at lowest possible cost (only the upkeep of ditches) averaging about 38c per acre, per year. One-half miners inch (about six acre feet) with every acre, from your own canal, with perpetual water right for every acre you buy.

The richest, loamy, easily worked soil, containing abundant lime and phosphates, producing enormous crops of alfalfa, grains, fruit and vegetables. (We just cut 28 acres of alfalfa, yielding 132 tons—almost 4½ tons per acre —at one cutting.)

Level lands, but with enough grade to irrigate easily, that can be cleared and prepared for crops at low cost.

Ideal conditions for live stock and poultry.

Good markets and R. R. transportation. Best of health conditions, in one of the finest climates in California.

Good neighbors, schools and churches, and solid banking facilities.

Positively the **VERY BEST** bona fide land proposition in the State, at reasonable prices and on easy terms.

Best of Bank and business references on request. We will demonstrate every statement to your satisfaction. You cannot afford to overlook this limited offer (only 55 forty-acre tracts in all) which is the new sub-division of one of the Banner ranches of this state. Just placed on the market by responsible owners. Write, phone, or call for further information and illustrated printed matter. G. M. REA, Sec'y,

Suite 630 H. W. Hellman Bldg., Los Angeles, Cal.

For Sale

A lot of light galvanized sheet iron pipe, 4, 5, 6 inches, in 10-ft. lengths, suitable for irrigation purposes. Prices right.

201 Main St. San Francisco

should have about 40 pounds per acre.

Canadian Field Pea.

The small white Canadian field pea seed is an old favorite. Of late years it has been used less because vetch seed was cheaper, but it has much in its favor. It is a vigorous all winter grower, gives good tonnage of green matter, and has a large tap root. The seed is larger than vetch seed and requires about 70 pounds per acre average.

I should say that 70 pounds of small pea seed would have same covering capacity as 40 pounds of vetch seed.

Tangier Pea.

The Tangier pea is a new promising variety. The seed is not yet plentiful. It will give a larger tonnage of vine than the Canadian, has tap root and is very vigorous. It is a good winter grower. If seed were available and cheap enough it would be superior to either the Canada pea or the Oregon vetch on account of its vigorous rapid growing habit and consequent amount of humus matter.

Root Systems.

The root systems of the legumes mentioned differ. The vetch has a fibrous mat of roots which tends to spread sideways with very little tendency downwards, probably due to easy development in loose top soil. There is very little or no tap root. The total amount of root, or its vegetative mass, is, however, considerable, and under equal conditions of growth and development, probably exceeds the peas. As a source of humus this root mass of the vetch is very important even though it tends to develop near the surface.

The field peas have well-defined taps, very long, with good resistance or penetration even in quite hard soils. These taps have good laterals, the number dependent on the open, rich nature of the soil. The Canadian pea root will go down four feet or more in a good sandy loam free from hardpan, between September 15 and January 15, in an average Southern California winter.

When and How to Sow Seed.

The seed of either vetch or peas can be sown between August 15 and October 15 with good chances of getting a profitable catch or stand. Vetch should always be put in before October 1, the earlier the better the growth. Peas will usually do well even when planted as late as November 1. But a more satisfactory stand will result with September planting.

Allowance must be made for furrows for winter irrigation, when necessary. So the usual practice is to first irrigate thoroughly and cultivate as though nothing were to be planted. Then drill in the seed about three inches deep and furrow out immediately or the day following. These furrows remain all winter, or until the cover crop is turned under. The depth of drilling seed will vary with soil. In light sandy soil four inches might be better and in heavy soil two inches sufficient. It will depend on locality and moisture conditions.

Some prefer to broadcast the seed just after irrigation and then cultivate thoroughly and furrow. The furrows must be in before the seed sprouts.

Others sow or drill seed before irrigating and allow those furrows to remain But where soil is a good loam or heavy the seed is apt to rot from excess water. Sandy soils may allow seed to be sown before irrigation. By irrigating first and thoroughly cultivating before planting, the ground is well loosened and the seeds come through better. By this method there will be no baking until after the next irrigation, by which time the cover crop is well started and better able to care for itself.

Cowpeas

Really a bean, of very great value for summer cropping.

Plow or Disk the Cover Crop

The most successful orchardists are working their ground as deeply as possible (an exception will be noted later). The object is to encourage deep rooting and a corresponding deep application of water. So I advise plowing the cover crop under. If the vine is too heavy some disk it first and then plow: The plow can do better work if ground is disked first. The only exception to this advice is the case of light sandy loam soils. There are soils in which tree roots persistently develop near the surface, no matter how deeply worked, and the continued cutting off of these surface roots reduces the crop very decidedly.

There are also soils subirrigated by nature so that the best root system is too near the surface to admit plowing. These are local problems and exceptions to the generally accepted practice of deep cultivation.

Non-Legumes.

The cereals such as rye and barley, and certain weeds like the mallow, alfilaria, etc, are certainly beneficial and desirable as a source of humus. They do not, however, increase the supply of nitrogen as the legumes do. But by their root action and development in the soil and the decay of their tissue when turned under they certainly improve the soil's condition and must be highly recommended. Rye and barley seed are cheaper than the

Things You Get Extra In No-Rim-Cut Tires

1 Extra Tire in 4

Goodyear tires now undersell 16 other makes. That is due to mammoth output—the largest in the world.

Numerous tires cost one-third more. You can buy four Goodyears for what three of such tires cost. That means to you one extra tire in four.

Or Extra Size

Or you can do this:

You can buy a half-inch wider Goodyear for less than some makers charge for smaller sizes. And the wider tires will fit your rims.

The same rims will take

A 30 x 3½ or a 31 x 4.
A 32 x 3½ or a 33 x 4.
A 34 x 4 or a 35 x 4½.

So with other sizes. The larger size has, on the average, 20 per cent more capacity. It has an extra ply of fabric. It has a thicker tread. It means far more mileage, far less trouble.

Yet the price men pay for many tires buys this half-inch wider Goodyear.

Four Extra Features

You get in Goodyear No-Rim-Cut tires the best tires men can build. A better tire, so far as known, is utterly impossible.

You get the tire which outsells any other, after millions have been tried.

And you get these four great features found in no other tire:

No-Rim-Cut feature—which makes rim-cutting impossible.

Our "On-Air" cure—an exclusive, costly process which saves all the blow-outs due to wrinkled fabric.

Our rubber rivets—hundreds of them are formed in each tire to combat tread separation.

All-Weather treads—the tough, double-thick anti-skids. Flat and regular, so they run like plain treads, yet they grasp wet roads with deep, sharp, resistless grips.

Those four great features—used by us alone—have saved tire users millions of dollars.

Half Former Prices

No-Rim-Cut tires are costing now half what they used to cost. They have dropped further than others because of our larger output. The same efficiency which perfected these tires is now bent on lowering the cost. And that's as important as any other saving.

Get this saving with the rest. Any dealer, if you ask him, will supply you Goodyear Tires.

legumes. The weed seeds—mallow, etc., cost nothing. All cover crops grown for humus increase the availability of insoluble forms of plant food.

Straw.

Threshed straw (usually barley) from the grain fields is a popular source of humus. It is baled and placed in the orchard between the irrigated spaces in the fall and spread over the furrows just after an irrigation. There is the advantage of a certain amount of seed left in straw which grows as the straw decays. The combination gives a good supply of humus and is freely used wherever straw is obtainable. The usual price paid is about $8 per ton delivered in the orchard. About one ton per acre of orchard is the usual application. It decays quite thoroughly by plowing time.

Alfalfa Hay

The first cutting of alfalfa is often used in place of straw and is really better, at the same price, as it contains more nitrogen. The weeds contained in the first cutting reduce its value as compared with pure alfalfa, but it is a very valuable source of humus. In years of scarcity it is fed to stock and not obtainable except at feed prices. Hay that has been damaged by rain so as to be unfiit for feed is still valuable for humus. It is handled and applied as in the case of straw.

Stable Manure

Manure is and always will be good humus material. There is not, however, enough of it to meet the orchardist's needs. Use it freely and often if not too high priced. Its plant food value is about one-third that of first cutting alfalfa and allowance must be made for the excess moisture and refuse sometimes contained. It is to be highly recommended wherever obtainable, but is not always a dependable source of humus.

Humus Value vs. Fertilizing Value

In this discussion a distinction should be made between the humic value of a material and its fertilizing value. The first has not yet been determined and may never be, but the fertilizing value of anything can readily be estimated, based on the market value of the three essential plant foods. The fertilizer value may be low and the humic value very high in a given material. The humic value to a poor soil is greater than that to a rich soil. It depends upon the agricultural need. By careful selection the two values may be well combined in one material.

Shavings, Sawdust, Culls

Such materials are good in proportion to their bulk. But they must be close at hand to be worth the haul and labor of handling. Their cheapness under special conditions is their only recommendation.

Local Humus Sources.

There are some situations where fenugreek or bur clover or yellow sweet clover (Melilotus indica) furnish more material and thrive better than the vetches and peas mentioned. These also are legumes, and what has been said of legumes earlier in this paper applies equally to them. Fenugreek is not a success in interior valleys, but is often preferred near the coast. Bur clover does well everywhere. Cheapness of seed is sometimes in its favor. Melilotus clover is promising. It grows tall, has strong, well-branched stalks and unusually good tap root. It may gain in favor as seed becomes available.

Buckwheat

This is a non-legume not in general use as it will not stand the winters. It must be classed as a summer cover crop and is possible only where excess water can be had. In inland valleys it makes an indifferent to fair growth and it is doubtful if its use will increase in such places. In coast sections where there is more moisture it is very successful and well thought of. Unless its yield of humus matter is excessive it has no special virtue over some good legume.

Cow Peas

The cow pea is really a bean and will not stand the winter cold. It is a legume and often used as a summer growth where water is plenty. Those who raise two humus crops a year (vetch or peas in winter and cow peas or horse beans in summer) believe it pays well.

Under the two-crop plan there are two short fallow or cultivation periods, one between the plowing of the winter crop, say January 30, and the sowing of the summer crop about April. The other is between the disking of the summer crop about August 30 and the fall sowing of the winter crop. The summer crop is usually disked, or if plowed, only very shallow, as the crop of fruit is maturing. and deep plowing at that time is a risk.

Most Humus in Shortest Time.

Use a combination of short fine straw and the legume that grows best in your locality. Apply both at same time. Place the bales in the dry centers. Sow the seed by one of the methods given (preferably after irrigation), then scatter the straw over the furrows just made for the winter. The legume and grain seed come through the straw together and grow as straw blackens and decays.

The result is a doubly heavy growth and they work well together. The grain plant supports the climbing vetch (if vetch is used) and the legume develops better than when running on the ground. The added warmth from the straw induces a better growth. The straw is practically rotted by plowing time and the question is only one of handling the heavier green crop.

The added lightness and fineness of the soil and the ease and depth of cultivation will be very noticeable all summer long. The way the water lasts will be very marked. The dark healthy foliage and full crop, together with the reserve strength of the orchard, will witness your wisdom and thought and care.

A PERPLEXING QUESTION

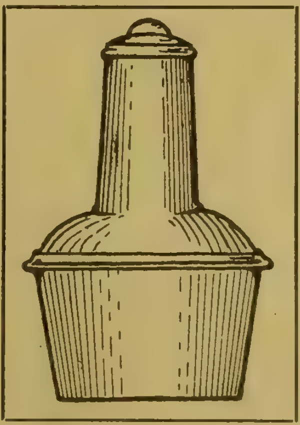
Written for the California Cultivator

By R. C. Allen, Bonita.

Your belief that "no question is more perplexing to the orchardist than that of keeping up the supply of humus in the soil" is certainly correct. Of course every orchardist knows the sort of things that will produce humus and the practical means of getting them into his soil will vary to some extent with the individual case.

Undoubtedly there is a general agreement that stable manure gives us the most positive and practical source of humus and everyone should use what he can get so long as a possible profit can be figured from its

NOW IS THE TIME



And it is getting late to check up your orchard heating equipment to prepare for the coming frost season—Delay may be costly—Last year so many orders were placed at the last minute that some growers were disappointed and were obliged to order inferior heaters—Luckily there was little frost last winter, but **does it pay to take chances** when we can supply you with safe insurance?

Our line this year includes a heater which **will burn the cheapest grade of oil without smoke.** Specify shipment when you wish, but place your order now.

Let us quote you prices. Address

American Can Company
San Francisco

or, in Southern California

Hammer Orchard Heater Co., **Consolidated Realty Bldg., Los Angeles**

will make the American farmer a king!

Watch *good* farmland soar in price!

All Europe is now engaged in what will undoubtedly be a long period of conflict. European agriculture and manufacturing will practically cease. The United States must feed the fighting nations. **The American farmer will have to work overtime.** Farm products will soar in price—**and good farm lands will also advance.**

Now is the time to take advantage of the **greatest farm land opportunity ever offered in the west—**

Milford Valley Lands

$30 per acre

under gravity irrigation system

Water right $70 per share with 12 years' time for payment if desired

Milford Valley lands are in a district where crops are netting from $50 to $400 per acre—think of this type of land at $30 an acre.

Milford Valley lands immediately become worth from $200 to $250 an acre when in alfalfa.

Authorities state this is the best alfalfa district in the west—3 cuttings net $70 and more per acre.

500 to 600 bushels of potatoes to the acre are ordinary crops in this district. As high as 800 bushels have been raised on a single acre.

Imperial Valley ranchers are buying Milford Valley lands—in fact, they have been our heaviest buyers.

Our great gravity irrigation system insures unlimited water at an annual maintenance cost that should not exceed 30 cents per acre.

The scil is of great depth and fertility—the climate is the finest in the west—elevation 4971 feet—as healthful as living in the mountains.

Pure, soft drinking water—high priced, eager markets, "main line" transportation facilities—tremendous possibilities of increase in land values—no pioneering—high type of well-to-do neighbors—no "homesteaders."

Best social and educational advantages—land is suburban to live, progressive city of Milford.

Milford Valley offers an exceptional opportunity for those who have already "made good," **to better themselves.**

Special excursions at low homeseekers' rates on Wednesdays and Saturdays—leaving 9 a. m. Write or call for new illustrated booklet.

use, but with the increased use of motor power the supply diminishes while the orchard area increases. Straw, especially bean straw, is almost as valuable for the purpose, but here again the supply is inadequate. As regards application, I have always hauled it direct from the field in the summer and disked it in. You ask if it would not have more value if plowed under deeply. As a rule one does not like to plow his orchard in the summer and thus lose moisture. Straw disked in the summer would be plowed under the following winter or spring and probably little of the humus would be lost. Even if so, there is a compensation in the fine condition in which the summer disking puts the soil.

The various cover crops are well understood by most growers. In young orchards where the ground is open they are sure to do well with proper culture, but in old orchards it is sometimes almost impossible to get good results. The citrus experiment station has conducted valuable tests which show great value in Melilotus clover, which seems likely to develop a more hardy growth in the shade of old trees than vetch. If we grow a cover crop we must have tonnage to make it worth while, and it is better to grow a heavy crop of rye than a spindling one of vetch, even though the former is not a nitrogen gatherer.

Another source of humus is the summer cover crop—again more practical for young trees than old—such as cow peas, soy beans or buckwheat. The two first are leguminous and where they do well produce an immense mass of green matter. Buckwheat occupies a position in summer crops similar to that of rye in winter as giving a sure and heavy crop.

Around Phoenix, Arizona, it is a common practice to grow alfalfa among orange trees. I believe that with us, in some soils and locations at any rate, it would be a good plan to plant citrus trees in rows 50 feet apart and grow a land of alfalfa between. The trees in such a case should be planted on a ridge so as to be well above the alfalfa. I am trying this with an old olive orchard and the experiment promises well.

When Mr. Luffman gave his talks in Riverside two years ago I was interested in his advice as to gathering every sort of vegetable trash and silt and putting it under the trees. Doubtless a lot of good stuff is burned up and let go to waste which might be put to use.

IMPORTANCE OF HUMUS

Written for the California Cultivator
By V. V. LeRoy, Claremont.

It is with a great deal of satisfaction that I see the interest your paper is taking in the subject of humus. The action of humus in our soil is not well understood by our scientific agriculturists, but it is becoming more and more sure that it is one of the most important ingredients necessary for the best results in the growing of fruit. I believe the horticulturists of California will save millions of dollars in fertilizers when the importance of humus is understood. Our soil has practically everything needed for abundant plant growth except nitrogen, humus and phosphoric acid. No amount of plant food is of value unless the plant can use it. In other words, all the elements for plant growth must be made available to the plant roots. Nitrogen is easily supplied in available forms, but from 15 years of practical experience in our arid region I believe large quantities of phosphoric acid and potash are put into our soils, which does not become available. Here is where humus gets in its work. By the action of humus and humic acid much unavailable plant food is made of use to plants. Without enough of humus in the soil great quantities of available fertilizers must be used to produce a profitable crop. This is accomplished by many, but hundreds might make their ranches profitable, who can't afford so much expensive fertilizers, by use of humus producing materials which in time liberate quantities of potash with which our soils are well supplied, and makes the unavailable phosphoric acid in cheaper forms available. In our arid climate humus is also much richer in nitrogen, about three times richer than in humid regions.

How to Get Humus.

How to get this valuable material into our soils is a question which must be solved generally by each grower, but to be successful in the future I believe this question must be solved. For years I have heard of horticulturists fertilizing in many entirely different ways, all commercial, all barnyard, part of each, some only using cover crops, others despising cover crops. Provided enough was used all have been more or less successful, but the cost of production has been large. After much study of the problem I b lieve the element of humus had more to do with the success than the kind of fertilizer.

For five years I used ten pounds of potash to the bearing tree. After reading some of Hilgard's lectures I concluded that I was throwing my money away and have not used a pound of potash since for over ten years, but have raised cover crops and supplied humus as much as I could. My crops have been uniformly good and of good quality, from six to eight boxes to the tree each year of navels. The year before last I had 5000 boxes on four and one-half acres after many years' use of cover crops (I planted my first cover crop in 1900).

The Cover Crop

I believe among large trees a cover crop does not produce nearly enough humus, as so little space can be covered. Still it largely pays because of many other uses. It stops washing, it makes many little canals for the rains to enter, below any hardpan or plowsole, thus storing moisture for the next summer, but above all it stops the constant cultivating and stirring of the soil burning out your humus and stimulating your trees toward winter growth, thus making them more easily frozen. From ten years' observation of a dozen orchards I firmly believe that constantly cultivating groves causes much more abundant dropping of fruit.

Cheapest Forms of Humus Supply

Bean straw and alfalfa hay are in my opinion the best and cheapest forms of supplying humus at present because of the large amount of nitrogen, as well as humus, in them. I would spread it in January and thoroughly disk it about the last of February.

Cover Crops at Minnetonka

Mr. Chauncy S. Sheldon of Minnetonka Ranch, near Claremont, has for two years been trying a somewhat new method of cover cropping for supplying humus. He sows a cover crop in the fall, the usual way, with furrows for irrigating, and leaves room for a furrow close to the tree. In February or March he plows every other space and lets every other space grow all summer, and matures a big crop which seeds itself for the next fall's growth. In February, a year after, he plows up the year's growth and allows the alternating space to grow its year, so continuing. The trees are doing well and producing good crops at a minimum outlay for fertilizers. His soil is in splendid shape and the trees do not show the lack of moisture during the summer although he has no more than the average amount of water. Humus is a great aid in holding the moisture in the soil until used. This looks like a system worth trying.

COMMERCIAL FERTILIZERS AS AN AID IN PRODUCING HUMUS

Written for the California Cultivator
By Ira S. Chapman.

There are many limiting factors in all crop production. By using the words "limiting factors" we are, in a broader way, stating Liebig's law of the minimum according to which the crop yield will be limited by the one particular plant-food element which may be deficient in the soil.

Buckwheat

Buckwheat grows fleshy stems, yet containing much of vegetable fiber. It has been grown more extensively this year than ever before in California orchards. See photo of buckwheat in orchard on cover.

This is true as far as it goes, but other factors aside from the lack of plant-food often limit crop production. The law must be extended to include such conditions as temperature, lack of moisture, excessive moisture, poor drainage, alkali or acid conditions, and soil texture, as well as poor cultural methods such as lack of or excessive pruning, improper cultivation, and humus. Any of these may be the determining factor which limits the yield.

As soon as one limiting factor is recognized and removed the production is raised to some certain point. Here another condition becomes the crop limiter and must in turn be remedied, and so on.

It is not necessary here to enter upon the beneficial effects of humus. Our soils are universally low in humus and every effort should be made to conserve and increase this most valuable constituent in the soil. Humus may be maintained in the soil both by the use of manure and green cover cropping.

The greatest value which attaches to barnyard manure and the plowing under of green cover crops is the attendant increase in the humus content of the soil. Care should be taken, however, in the use of these manures to see that the soil is plentifully supplied with lime, otherwise an acid or "sour" condition of the soil may occur.

But no matter how well the humus supply is maintained, or how thorough the cultivation, enough plant-food cannot be rendered available each year without artificial fertilizers, to produce the maximum yield.

Therefore, as long as it is necessary to use fertilizers as well as humus producing mediums to obtain maximum results, we can use those methods that will accomplish results in the most economical way.

There is no question or doubt but that barnyard manure is the first and most direct way of producing humus, but green cover cropping accomplishes the same thing. Certain materials or constituents contained in commercial fertilizers will increase the growth of cover crops. Most green crops used are leguminous plants, and as these plants withdraw most of the nitrogen required in their growth from the atmosphere, there remains only phosphoric acid and potash to be removed from the soil. These two elements are usually the principal constituents of a summer or fall fertilizer, and therefore are of direct benefit not only to the fruit crop but to the cover crop as well.

The expense of maintaining humus by the use of a green crop is very slight, especially when aided by a properly balanced fall fertilizer, and there is no question but that humus plus fertilizer is better than humus without commercial fertilizer.

SUGGESTIONS FOR A WILD CROP

Written for the California Cultivator
By J. W. Garthwaite, Corona.

In deciding upon the best plant to use for a cover crop, each grower must be guided by his own peculiar needs. One grower may think it well to sacrifice bulk for nitrogen, while another may feel that the need of his soil is humus and that the nitrogen can be applied in another form. Still another may be so situated as to be in danger from floods in heavy winter rains, and feel that his greatest need is for a crop that will root so heavily and grow so strongly as to retard rushing waters and so not only protect the ground from such catastrophes as befell many orchards in the very wet districts last winter, but conserve for the good of the soil a large amount of the surplus moisture.

Having considered these and other points and arrived at a decision as to the sort of plant he wants, the grower must then consider the conditions under which his crop is to grow—such as water, time of planting, trampling and so on—and sow a crop that will tolerate any adverse conditions which it may encounter. Until a couple of years ago, vetch, mixed with barley, seemed, from the standpoint of bulk and nitrogen, to be very satisfactory. Then the vetch grew weary of its good record and declined to grow. Many looked upon this as a natural result of a dry year, but the experience of the writer was the same last year, which was not dry, and the thought presented itself that two winters ago the unfortunate vetch was trampled night after night by companies of devils with blackened faces who bore firebrands and made night hideous with red flames and black smoke; and trampled day after day by other companies of devils carrying fuel for the fires of the night shift. And last winter there was some trampling, and every winter from now on there will be some. It would seem, then, that the most serious problem before the grower who wants a good cover crop and wants also to protect his fruit from frost by any of the methods in common use at present, is to find a plant that will stand trampling.

Wild Mallow.

On the question of nitrogenous crops which will stand such usage the writer has no word, but as a humus crop of great bulk and strong rooting proclivities which will stand all sorts of abuse a word or two must be said regarding the common maallow (Malva rotundifolia). Several orchards in this district were blessed last winter with splendid stands of this plant, which in many cases had by midwinter attained a height equal to half that of a full-grown lemon tree, and had sent out such a root system that a horse could scarcely pull it from the ground. In January or February the weeds were mowed, after which a new growth was put out even stronger than the first. In spite of this great bulk of stalk and root, no difficulty was experienced in plowing after disking with a well weighted and very sharp disk. The superintendent of the orchards in question, reports however, that in many cases

"Best on the Surface of the Earth"

"AMERICAN" Surface Irrigation Pipe

The pipe with the original double-locked turned seam—stronger—more durable—more convenient—more satisfactory in every way than riveted pipe, and far superior to any other surface irrigation pipe of any character.

In lengths 10 feet 6 inches.

Don't experiment with unknown pipe—get the tried and tested "American." Write for catalog.

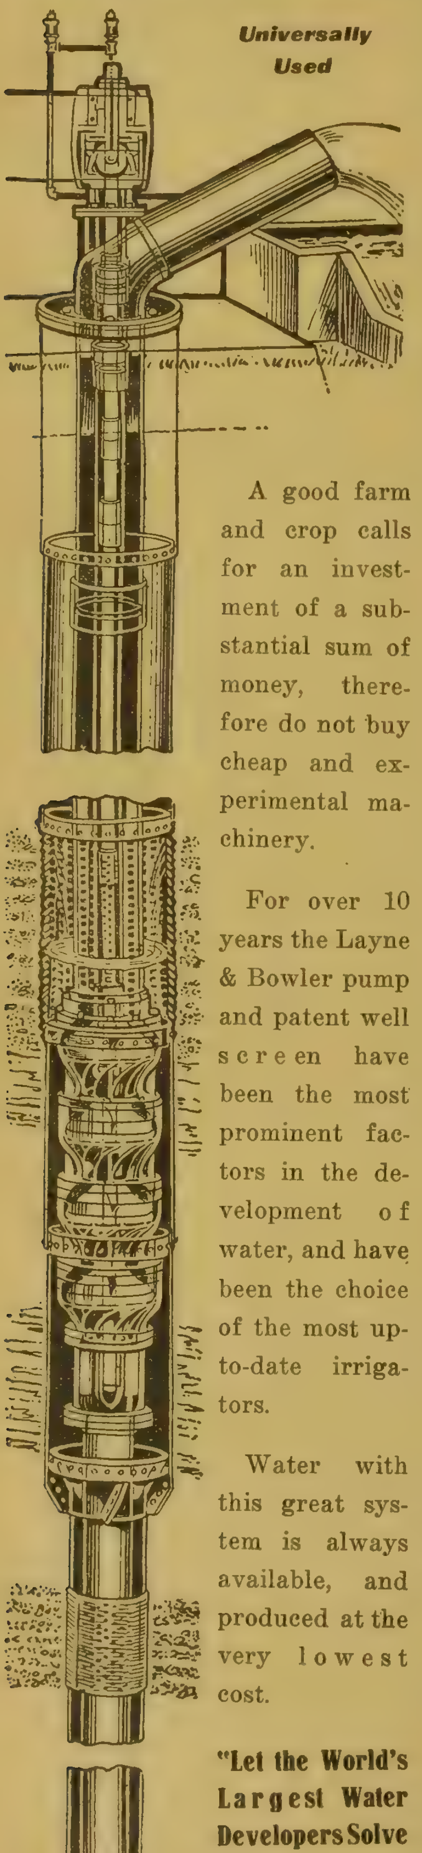
Two Great Factors
in
Water Development

Layne & Bowler
Pump and Screen



Universally Used

A good farm and crop calls for an investment of a substantial sum of money, therefore do not buy cheap and experimental machinery.

For over 10 years the Layne & Bowler pump and patent well screen have been the most prominent factors in the development of water, and have been the choice of the most up-to-date irrigators.

Water with this great system is always available, and produced at the very lowest cost.

"Let the World's Largest Water Developers Solve Your Pumping Problems."

Our illustrated Catalog No. 30 tells all about this pump and screen. It also gives valuable irrigating information. Write today for it.

Layne & Bowler Corp.

900-910 SANTA FE AVE.
LOS ANGELES, CAL.

he did not plow until summer, and in some cases not at all, and that owing to the beneficial effect of the heavy rooting of the plant, the ground is still in fine condition. He is not aware that mallow seed is to be purchased, but says his crops were all volunteer. He encouraged the weed by doing his fall work early, say in September, planting such nitrogenous crop as he wanted at that time. Then the mallow started of its own accord in any place where it had grown before. It would seem that where the desire is for a humus crop, or for a crop to protect the soil against flood, a trial of the mallow weed might be well worth while.

MORE DEFINITE KNOWLEDGE NEEDED

Written for the California Cultivator
By Fred M. Reed, Riverside.

Your letter asking for information about humus-forming materials for soils is at hand, and I hasten to confess that after 24 years of experience in fruit growing in this locality, I am as much at sea in regard to this matter as many of my neighbors. I have seen so many apparently successful humus forming practices turn out to be either neutral or failures, after a series of years, that I look with distrust on any positive statements about fertilizers or cover crops, especially where a man who has made a success in one locality claims that his methods will prove equally successful in other places and under all conditions.

I am fairly well satisfied that stable manure at four or four and one-half cents per cubic foot, is too costly a source of supply for citrus groves, either as a supply of humus or nitrogen or as a surface mulch.

Straw and Sawdust

In our locality, where the soil and air are both dry nearly all the time, the effect of straw, sawdust, shavings or stable manure made with shavings, is more of a damage than a benefit when stored in the surface soil, as all of them tend to dry the soil and make it hard.

Experiments

We have found that when such materials, and even much coarser stuffs, such as brush or palm stubs, are buried in pits or trenches below the zone of cultivation in shallow soils over hardpan or rock, that they serve as sponges to hold the moisture, and the trees are greatly benefited, but the same treatment of trees on deep moist soils does not seem to show any advantage.

Shavings Being Tested as a Humus Former
Photo By I. J. Condit

The securing of humus from shavings or sawdust has never proven very satisfactory, and experiments should be tried with caution. Never use redwood shavings or sawdust unless they have been thoroughly weathered and even partially decayed.

We have a small experiment of permanent mulch,—no cultivation or fertilizer for 18 months. The trees treated in this way are no better or worse than the other part of the orchard, which has been treated in the usual way and heavily fertilized both with stable manure and good commercial fertilizer. All have lamentably light crops set.

Return Prunings to Soil.

The practice of returning to the soil all prunings and leaves we find at least as beneficial as a source of organic matter in the soil as the ordinary grade of stable manure on the market. This material can be left on the surface until it gets brittle, a matter of ten days or less in summer, when all but the largest brush breaks up under a disk cultivator. This practice is not only cheaper than the foolish and wasteful one of burning or hauling this valuable organic material away, but I am sure that the mass of leaves and fine twigs make a much better material to mix with the surface soil mulch than the grain straws or the planing mill shavings, which if they contain either oak or redwood, may be positively poisonous to the plant roots.

Cover Crop Experience Conflicting.

As to cover crop, the experience in our locality is conflicting and unsatisfactory. No one can prove that the cover crop as usually grown hereabouts is either a benefit or a detriment to the citrus groves. We know of groves, side by side, which have had cover crops, and others whose owners have never used them, and now one system shows no advantage over the other either as to condition of the trees, crops, soil or financial returns, or lack of them. We are fairly well satisfied that a combination of vetch and rye, allowed to stay on the ground until April or May, puts a fine mass of cheap organic material in the soil, but the condition of the groves so treated certainly does not warrant one in boasting that the system is a practical success.

While these notes are merely a frank confession of ignorance on this subject, they may at least help to show the need of more definite knowledge of the matter than we now possess.

Cooperative societies to be of any benefit to the farming population must be organized, maintained, and operated by the farmers themselves for their own interests, and are not to be organized on a profit-making basis.

GRAINS FOR COVER CROPS

Written for the California Cultivator
By Chas. R. Paine, Craftonville.

Answering your letter of inquiry concerning the use of grains for winter and spring growth of cover crops, I reply that it has been quite a common practice in this region, this season especially. Growing crops on orchard areas, winter or summer, or both, for restoring humus, is now more practical than getting humus material elsewhere.

Most crops were plowed under while still green and the surface soil made mellow by the decay of the great mass of green material in the soil.

Where there was delay in getting it broken down and covered there was trouble in furrowing and irrigating, for the water was impeded in its flow, but, as I observed, the ground absorbed it as it did the rain so abundant the past season. New growth on orange trees is profuse in consequence.

This paper would rather not have an advertisement than to have a bum one. Ours are all sound and certified.

We Need More Exact Knowledge

We ranchers know only in a general way of the advantage of green cover crops, even of those non-leguminous, but we seem to be leaving the exact determination of their value to the experiment stations.

Because of well understood reasons applied fertilization (this season) was not so common as heretofore, green manuring largely taking its place.

We would like to have demonstrated to us by the constituted authorities the difference in new growth and fruiting results of different tracts, the one group fertilized as science says it should be, and the other group unfertilized, but having cover crops of various kinds, leguminous and non-leguminous, winter crops and summer crops.

Perhaps, when hard times come, on account of unpropitious seasons, and prices for the citrus crop that follow the lowering of the tariff, as one factor, we may be able to keep up the producing power of the fruit trees by supplying humus grown on the ground; of course, by such a method we are using up the natural supply of fertility. By the way, wouldn't it take us many lifetimes to do that, if we knew just how to rob mother nature of her immense supply?

I do not mean to say that applying new elements of food to a soil covered with old trees is not the part of wisdom and profitable. The monarchs of the forest make a fine living from self-made fertilizer and Whittier says: "Ever on old decay the greenest mosses cling."

Buckwheat in Grove

Just before I began to write this I went to an orchard less than a mile away where buckwheat was grown last summer and where I saw seed for a new crop sown again this spring. The plants average more than two feet in height and are very thrifty. They have no nodules on their roots and the foliage is not compact. I hope the grower will keep up the sowing for some years and that we may learn results of value. His orange crop was good last year and is as good, perhaps, as anyone's this season of varying crops.

PREVENTING FLOOD DAMAGE

Written for California Cultivator

By Georgina S. Townsend, Azusa

The terrific floods of last spring demonstrated, both upon slopes and levels, as nothing else has ever done, the incalculable value of cover crops. Orchards where the slope of the land was considerable were riddled with the rushing water wherever there was no cover crop or vegetation. The top soil was scoured off down to the feeding roots which were left exposed. Wherever the water secured a chance to gouge out it did so, leaving great chasms, yet once it hit a cover crop the eroding was immediately stopped, the waters sliding over the vegetation and filling it up with silt which proved a very valuable fertilizer to those who had in the cover crop.

Cover Crop as Soil Binder

The above photo, taken by J. R. Garthwaite in the foothills not far from San Gabriel River, is a good "horrible example" of an orchard in which there was no cover crop. The soil had been kept thoroughly cultivated and when the flood of 1914 struck the orchard every particle of surface soil was washed away and in its place a mass of boulders and gravel was deposited. The surface of other orchards nearby in which heavy crops of rye or other soil binders were planted were preserved almost intact. This is ordinarily a secondary consideration of cover crops, though in this particular case a most vital one.

The greatest damage was done along the washes where the storm waters carried away whole acres of land, with big trees. A few places were wholly protected and saved from destruction by various plantings along the edges of washes. Those who had eucalyptus bordering the washes lost less than those who had nothing, and borders of bamboo protected land to a great extent, but the most valuable of all seemed to be the pampas. In some places there are long hedges of this formidable plant, and against them the waters beat with terrific force, but without effect. Those who have land bordering upon even the tiniest wash would do well to plant the whole edge with pampas roots. The plant itself makes an attractive appearance even when not in bloom. It requires no care. It is far easier to secure than any made protection. Cement and wood and stone went out with the first rush of water in almost every place where they had been used, but the sturdy pampas turned aside not only water but the debris which it carried. It seemed impregnable.

The vetch cover crops did not protect the ground from the ravages of the water as well as some of the other crops, notably mustard and mallow. These tough, deep-rooted plants seemed to bind the soil more firmly and present a more wiry resistance to the water than did the vetch. We had planted our ten acres to peas, which did not make a very good stand during the winter, but mallow and mustard had volunteered until we had a heavy crop all over the orchard which stood four to five feet high at the time of the flood. The orchard to our east, some 40 acres or more, was bare, and had just been nicely cultivated so that it was soft and soluble as sugar. The Big Dalton when it broke over its bed came tearing down across the roads, ripping out cement walls and all obstructions, and tore across this cultivated ground, leaving it in great chasms, and carrying away several acres. Part of the volume of water poured down upon our ten acres, but striking our cover crop, silted it up and slid over. Not a particle of gouging was done where the ground was covered with growth, and from one to three feet of silt was left upon our land. This was exceedingly rich, even if we were obliged to distribute it after the storm was over. The slope of the land was great, so that the trees upon the lower edge were three or four feet under silt, all of which had to be removed.

SUMMER COVER CROPS

Written for the California Cultivator

By R. R. Snowden, Los Angeles.

I have found a deficiency of humus in the citrus orchard soils of California the rule rather than the exception, notwithstanding nearly every orchard annually produces a cover crop which is plowed under. That clean cultivation during the summer months is responsible for this condition is generally recognized.

Treatment of Summer Crop

In my opinion the best method of restoring and maintaining the humus supply is to grow a summer cover crop—preferably a legume—cut it as soon as sufficiently grown and allow to lie on the ground till after the first rain, then plow under. Plow after each rain as soon as the soil is in proper condition, thus securing the absorption and retention of practically all the water falling upon the land. While there would be produced an increased demand for moisture during the growth of the cover crop, this will probably be fully offset by the better conservation of the rainfall water, and after the first winter of this treatment the extra demand for water will be met by the soil itself with increasingly favorable moisture conditions. It might be advisable to follow Mr. Gerald Geraldson's plan of alternating this with clean culture in such a way that every two years each midrow will have received both treatments yet at no time having adjacent midrows alike in the summer.

Melilotus Indica Recommended

The legume I recommend is the yellow-flowered sweet clover or melilotus indica. This plant is deep-rooting, has a large root system, and compared with alfalfa will produce more dry matter in a given time. A portion of the humus produced will be deeply placed within the soil with corresponding improvement in aeration and tilth. These factors together with protection of the soil from the summer sun will encourage the development and activities of the beneficial bacteria and earthworms, both of which are essential to the highest efficiency of the soil.

Irrigation Through Cover Crop

It may be objected that the presence of the cover crop will hinder the movement of irrigation water. This obstruction may be minimized by opening the irrigation furrows after the seed has been sowed, leaving the furrows freer from growing plants.

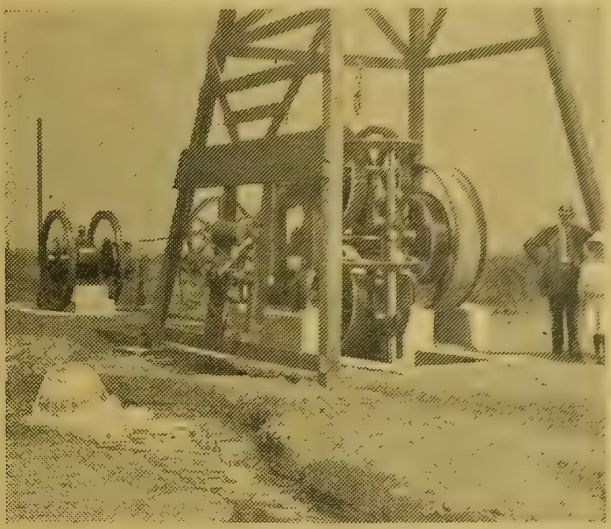
But even if some difficulties are encountered in this practice, the maintenance of an adequate humus supply is of such importance as to justify some sacrifice in other directions.

All the above suggestions are offered, assuming as a condition precedent to success, the maintenance of a proper chemical status of the soil.

Pomona Deep Well Pumps

THE BEST DEEP WELL PUMP IN AMERICA

This may seem like a very strong claim to make, but there are plenty of users in many states who will verify our claims in every respect.



This photo shows the pump and derrick of the Ritchie Plant, Ontario, Cal.

58 H. P. Pomona Pump Head; 12x110 Cylinder; 250 feet to water; 312 ft. to bottom of cylinder. Gives a 60-inch flow of water.

ASK ANY MAN WHO OWNS ONE

If you are figuring on installing a deep well pump we cordially invite you to come to Pomona and see our plant and talk with our irrigation experts. If you can't come to Pomona—write us.

Pomona Mfg. Co., Pomona, Cal.

Located in the Center of the Largest Deep Well Irrigation District in the World

We make a full line of gates and valves for cement pipe irrigation. The Pomona Patent Pressure Gate is the most popular gate in use anywhere.

Humus

The use of cover crops as a fertilizer and a means of adding humus to the soil has become established among the most progressive orchardists. The value of legumes in adding available nitrogen to the land is recognized in every line of husbandry, and the fruit grower has found the addition of humus a great saving in irrigation.

Fenugreek

Vetches, Burr Clover, Melilotus Clover are all highly productive of humus and nitrogen in soil. Fenugreek makes an especially dense growth and grows to excellent advantage in heavier and poorer soils.

Nitrogen

Hand in hand with the increasing use of cover crops has come the development of the nitrogen gathering bacteria, which has reached its highest point of commercial success in "Farmogerm," a high bred culture of bacteria, preserved in containers that admit air, yet prevent the admission of destroying germs.

Farmogerm

This product is most easily applied to the seed before planting, the result being an enormous increase in the foliage and nitrogen nodules of the crop. Many planters report an increase of three hundred per cent in tonnage, which is all returned to the soil through the decomposition of the plant. Write Dept. C for special literature and expert advice free.

INTERNATIONAL COMMERCE

We have from Mr. David Lubin, the Californian of whom we are all proud, who is now representing the United States in the international institute of agriculture at Rome, a letter in which he urges consideration of the proposal for an international conference on the regulation and control of ocean commerce by means of an international commerce commission. The maintenance of such a commission would aid in steadying the world's prices on staples. It is suggested that this conference be held in Rome in 1917.

ESSIG TO U. C.

We have letter from State Horticultural Commissioner A. J. Cook informing us of the resignation of E. O. Essig as secretary of the commission. Mr. Essig has accepted work in the entomological department of the University of California, so that California agriculture will still be benefited by his services.

SWITCHING CHARGE

Shippers who have had occasion to send produce to San Francisco or Los Angeles will be pleased to learn of the ruling of the interstate commerce commission abolishing the switching charge of $2.50 per car. This charge has been levied for years in these cities, while it has not been in cities of the East, and Pacific Coast shippers and receivers have felt it an unjust discrimination.

CALIFORNIA STATE FAIR

The premium lists of the California state fair are being mailed. Anyone interested should write the secretary, E. J. Delorey, at Sacramento. Mr. Delorey has only recently been appointed to his office as secretary. He was formerly secretary of the California Breeders' Association, also of the Los Angeles Driving Club. The premium list is the largest and most complete ever issued by the state agricultural society. We believe the fair will follow suit and be the largest and best yet.

WHAT IS HUMUS?

The above question is better answered in the articles in this issue than it can be on this page, but we take occasion to call attention to one answer given by Mr. Doty in his article. Mr. Doty does not believe that humus is formed as the result of decaying vegetable mold, but is a growth induced by bacterial action made possible by decaying vegetable matter. In this regard, permit us to give Webster's definition of humus: "A brown or black material formed by the partial decomposition of vegetable or animal matter; the organic portion of soil." But fortunately the question at issue is not a vital one, for Mr. Doty and all others agree on the necessity of securing humus. Whether a bacterium manufactures it in one way or another is a small matter, provided we get a sufficient supply.

DON'T SUMMER FALLOW

"Tillage is manure" and "Air is manure" are common sayings with writers who urge better culture of our soils to secure better returns. Both are true. Bacterial action is secured in soil only by the admission of air, and air is introduced into the soil by tillage. Consequently, increased fertility and moisture holding capacity as a result of summer fallow have induced many farmers to follow this method. Perhaps there are circumstances when it is justified by results. But there is one result often overlooked by the farmer until his soil becomes of such a putty-like consistency that he is compelled to stop and observe. Summer fallow is sure death to humus in the soil. Especially is this true in California's interior valleys, where the scorching sun soon destroys the life in the soil. Don't summer fallow in California if you would maintain your soil at the highest productivity.

POTATO CONVENTION

State Horticultural Commissioner A. J. Cook writes regarding the potato convention which will be held in Stockton in September. The intention at first was to hold this convention during the present month, but experts from the department of agriculture at Washington, whom it was hoped could be secured, were so occupied that they could not come until a month later. Now Dr. Cook sends us copy of Secretary Houston's letter in which he states that Mr. W. A. Orton and Prof. Wm. Stuart will attend the convention and be able to arrive about September 20, and suggesting as dates for the convention either the 24th and 25th or 25th and 26th. Dr. Orton is pathologist in charge of truck disease investigations, and Prof. Stuart has been in charge of potato investigations. In addition to these specialists other features will be on the program, and Dr. Cook assures us it will be one of greatest interest.

GRAVENSTEINS

King Gravenstein ruled all of last week in Sebastopol, one of Sonoma County's beautiful little towns. It has been our pleasure to attend several of these shows, and they are indeed most worthy of the effort of Sonoma County's apple growers. Regarding the present year's show we quote from a letter received from Commissioner A. J. Cook, who had the choosing of the judges who placed the awards:

"The apple show was superb. I doubt if another such collection was ever got together. In the hundreds of boxes that we examined we only found one worm, almost no scab and the discounts were very light indeed and came almost all from lack of stem or light bruises. This exhibition proved beyond doubt the value of such exhibitions. They have made Sebastopol famous and have called the attention of the whole country to the wonderful Gravenstein apple and, more than all, have resulted in securing a pack that is very superior. This will alone warrant all the expense incurred.

HUMUS

Doubtless every reader of the Cultivator is interested in the maintenance of soil fertility. That this particular issue is given almost entirely to discussion of cover or green manure crops will call for no apology. Almost every department is crowded out to make room for it.

Some years ago when it was seen that the supply of stable manure was not sufficient to maintain soil fertility the world felt great relief when the almost inexhaustible supply of bones was found scattered over the great plains, and thought, "There's the solution of the phosphoric acid question." With Germany's mines producing the required salts of potassium and Chile furnishing the nitrates, the chemist felt that he had figured out formulas which would bring greatest profit to the farmer. But too often the application of these chemical manures failed of best results. Sometimes the failure was charged to the dishonesty of the fertilizer mixer—and possibly this may have been correct to a degree—but careful investigations have shown that the elements of fertility are not the only requirements of a productive soil.

Bacteriology and soil physics entered into the discussion, and today the farmer understands enough of soil conditions to know that the question is a wonderfully complex one. This issue of the Cultivator looks at the question from only one angle, that is, how we may best restore and keep up the supply of humus in our soils. The discussions by those who have succeeded in their orchards is intensely interesting and we hope will lead to more consideration of this matter of vegetable mold in our soils.

Agricultural News Notes

The Panama canal is now open to commerce.

Russian thistles, cut young, are made into silage by New Mexico farmers.

Anti eight-hour law organizations have been formed in 20 counties of this state.

Apple growers and traders last week held their twentieth international convention in Washington.

Kansas began to send wheat to market this year on June 20. The usual time for the first car is July 1.

Farmers of Sedgwick County, Kansas, are learning to irrigate. They have had 20 pumps in use this season.

Up to the middle of July Florida's citrus shipments amounted to 21,000 carloads. The season closed the last of July.

New Mexico will have an extensive exhibit of sheep and wool at its annual state fair at Albuquerque, October 5-10.

Thirty-five nations have accepted the invitation of the United States to participate in the Panama-Pacific Exposition of 1915.

Hundreds of sheep were burned recently in the Bourbon stock yards at Louisville, Kentucky. A car of oil on tracks near the yards exploded burning many loaded freight cars and spreading to the sheep yards.

That all ocean freight rates be regulated by an international commission similar to the interstate commerce commission is the proposal of David Lubin of California, delegate to the international institute of agriculture at Rome.

A pest of grasshoppers is being fought by farmers of Fulton County, New York. The state department of Agriculture and department of entomology of Cornell are on the ground investigating and giving advice as to best means for destroying the hoppers.

Last year nearly 100,000 boys in 11 southern states, each raised one acre of corn. In the same states more than 33,000 girls each raised and canned one-fourth acre of tomatoes. This is a big showing for the work of the government in encouraging and organizing corn growing and tomato canning clubs through the south.

A national association for the extension of dairying has been organized in Argentina. It includes six commissions. The first is concerned with milk and the scientific maintenance of the dairy and the cows, the second with the sale of milk for consumption and the sterilization plant, the third with the manufacture of butter, the fourth with the manufacture of cheese, the fifth with the manufacture of other dairy products and by-products, the sixth with legislation, education and trades.

As a result of the sheep and wool conference held recently in Washington growers and manufacturers are urging a federal bounty system as a means of exterminating predatory animals on western ranges, the enactment of state laws to control dogs in farm states, the standardization of wool by the department of agriculture, the establishment of government sheep-breeding farms to determine the breeds of sheep best adapted to various conditions, and the creation of wool colleges for the promotion of more scientific methods in wool production.

Agricultural News Notes of the Pacific Coast

Northern California

Yolo County has decided not to hold a county fair this year.

Winters, Yolo County, shipped out her first Tokays July 28.

Butte County this season reports 12,500 acres planted to rice as compared with 400 last year.

Some 1000 acres of brush were burned last week in a forest fire near Willits, Mendocino County.

Over 3000 acres of the Phelan Ranch west of Chico, is being prepared for planting to rice.

The Humboldt County Dairymens' Association held its second annual picnic at Loleta, Saturday, July 25.

A full crop of Drake and Peerless almonds is promised in Yolo County. Ne Plus Ultra are reported about 65 per cent.

The packing of table grapes is proceeding without any check now since the warm weather has brought up the percentage of sugar.

Five hundred acres are planted to olives in Shasta County, according to report of County Horticultural Commissioner Lamiman.

Trial fields of tobacco planted last spring in Grass Valley are in splendid condition and it is claimed that it will be of fine quality.

J. F. Grass of Hollywood, has been appointed cow-tester of the Yolo County Cow-Testers' Association. Grass succeeds Hugh Cameron.

The biggest fruit train in the history of Eldorado County left Placerville one day last week with a consignment of 28 carloads of fruit and lumber.

The full farmers short courses in agriculture will be given at the university farm at Davis, October 5 to November 14. Horticulture will be given particular attention.

Cordelia, Solano County, is coming to the front as a shipper of fresh deciduous fruits, 70 carloads having been shipped so far this season. Much of the fruit is grown in Green Valley.

Humboldt County's farm adviser, A. H. Christiansen, has issued a report of his year's work completed July 1. Humboldt County was the first in the state to appoint a farm adviser.

The farmers of Mendocino County are building silos and buying blooded cattle and the old way of allowing cattle to "rustle their feed" is fast being superseded by modern scientific methods.

Hop picking in the Butte County fields will start about August 25, two weeks later than last year, according to the growers. Contracts for the hops are at present being closed at 13½ and 14 cents a pound.

Farm Adviser Searls of Yolo County in his July report to the Yolo County farm bureau stated that during the month he had made 78 personal visits to farms. Four spraying demonstrations were made for the control of the red spider. Fifteen demonstrations were made of the summer pruning of apricot trees. Sixteen soil tests were taken. Two hundred and twenty-five hogs were vaccinated with serum to save well animals in infected herds. Only one animal was lost.

Central California

Fresno County is shipping Malagas.

A dairy show is to be held at Modesto in October.

Rice is being produced successfully in Tulare County.

There are 5000 arces of sweet potatoes about Turlock.

Bakerfield reports heavy shipments of green fruits every day.

A Tulare County man is exhibiting specimens of white tomatoes.

An Inland Waterways Convention was held last week at Stockton.

Barley producers are holding, watching and waiting war prices.

Fresh fruit shippers are greatly relieved at the turn of the railway men's strike.

The cannery at Selma, Fresno County, is running full handed on peaches.

The Watsonville Apple Annual will make extended exhibit at the coming state fair.

The Modesto Irrigation District has advertised the sale of its $610,000 bond issue.

During the hotter weather many haymakers have done their mowing in the moonlight.

Fumigation in Tulare and Fresno County citrus orchards is proving thoroughly successful.

The harvesting of almonds is to begin early next week in the Modesto section of Stanislaus County.

Directors of the Kings County Fair Association recently met at Hanford and discussed details for the coming fair.

Tulare County peach growers are much dissatisfied at the low prices. Three and three-quarter cents is now offered for dried.

Porterville reports its crop of lemons one of the very finest. One ranch is anticipating an output of 6000 packed boxes.

Farmers living along Packwood Creek have asked an injunction to restrain the sugar company from emptying its refuse into the creek.

The San Joaquin Valley Sugar factory at Visalia is expected to run for another month. The factory is now handling 400 tons of beets a day.

Grape buyers of Lodi, San Joaquin County, have fixed a price of $20 for Tokays delivered before September 10, after that the price will be $12.50 per ton. This is lower than in former years.

The Dinuba Farmers' Union packing house started work on dried fruits the last of July. After peaches are out of the way the packing house will work on raisins practically all the winter.

A serious forest fire swept along the banks of the San Joaquin River in Madera County and pasturage and hay on several ranches were destroyed. A force of 500 fighters finally brought the fire under control.

Members of the California Green Fruit Association in the Fresno district are urging that a concerted effort of all deciduous fruit growers and shippers be made to have a general standardization law passed by the next state legislature.

Southern California

The sugar factory at Huntington Beach is now operating.

Work has begun on Riverside's new citrus by-products factory.

A Tri-County Cow Testing Association was recently organized at Riverside.

Ventura County proposes to have a representative agricultural fair this fall.

Celery growers of Orange County are now busy setting out the new crop.

Fumigation has commenced in the Lemon Grove section of San Diego County.

The last of the grapes have been brought into the packing house at Coachella.

Prospects for the bean crop in the Bolsa section of Orange County are most excellent.

Farmers of Ventura County organized on July 28 to work against the eight-hour law.

Santa Barbara County sheep men are planting carob trees expecting the pods to furnish forage.

Riverside boosters are touring the various parts of the county working up sentiment for the coming county fair.

Brawley cantaloupe growers are already planning next season's distribution. This year's crop has paid fairly well.

Beet growers of Bolsa, Orange County, are busy harvesting sugar beets. The sugar tests are reported running high.

Owing to war prices on cheese and low prices on butter, Imperial Valley dairymen are making cheese. This is especially true of the Swiss dairymen.

Imperial Valley's cantaloupe crop for 1914 amounted to 4446 cars. There were also shipped out this season 476 cars of watermelons. This latter figure includes casabas.

18,000 geranium plants are to be distributed by the Santa Ana chamber of commerce, on August 19. These are for planting along street parkings of the county, to make them beautiful for 1915.

Perris, at a recent meeting of her chamber of commerce and alfalfa growers, has decided to postpone the Alfalfa Day celebration for one year and then join in assisting to boost the county fair to be held in Riverside in October.

Superintendent Walter Packard of the Imperial Valley experiment farm at Meloland is urging all ranchers who can afford the time to spend a few weeks at Davis, taking some of the farmers' short courses offered in fruit culture. The courses will be given October 5 to November 14.

A quarantine against citrus nursery stock has been issued by Ventura County's Horticultural Commissioner, applicable to San Diego County, Orange County, Los Angeles County (except the San Dimas district and the San Fernando Valley), San Bernardino County, Riverside County and Tulare County. The quarantine became effective August 1.

The Coast

Eastern Oregon reports ideal harvesting weather.

There are five dairy testing associations in Coos County, Oregon.

Over 15,000 head of cattle have been sold from the Tonto forest reserve in Arizona.

Farmers near Pendleton, Oregon, report wheat running close to 50 bushels per acre.

The Spokane district of Washington will begin shipping prunes the first of September.

Jersey breeders of Washington County, Oregon, are organizing a breeders' association.

A survey of the timber lands of the Apache forest in Arizona was made the first of the month.

Cochise County, Arizona, is discussing the matter of a fair this fall. It will be held October 29-31.

Summer rains have been plentiful in the Tonto Basin in Arizona. The ground is now thoroughly soaked.

A new branch of the fruit growers exchange has been organized near Spokane. Its brand will be "Sunset."

The Salt River Valley of Arizona produced 250 carloads of watermelons this season. Shipments began June 12.

The annual meeting of the Hackney Horse Breeders' Association was held at Willcox, Arizona, last Saturday night.

The prune crop of the Northwest is generally estimated about one-third less than in 1913, but quality much better.

Extensive forest fires near Fernie, B. C. have done great injury to forests and 13 lumber camps have been destroyed.

The offers for fat steers at the Arizona state fair is causing many feeders to make strenous efforts to pull down the prizes.

Apple growers of the Northwest are fearing greatly reduced consumption of apples because of the European war. Oregon apples were marketed in ten different European countries last year.

The By-Products committee of the Seventh National Apple Show has issued an invitation to those interested in the manufacture of fruit by-products to attend a meeting to be held at Portland on September 10, at which time this most important subject will be discussed from all its angles.

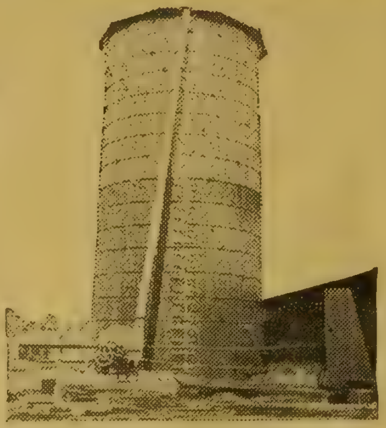
Horticultural Inspector DeSellem is trying to get assistance from the agricultural college at Pullman, Washington, to establish a bureau of information to answer questions of growers as to fire blight. The inspectors have so much actual work to do that they cannot satisfactorily answer questions of growers.

Arizona has an initiative bill coming up this fall generally known as the 80 per cent law, which provides that any person or company employing more than five workers at one time must employ not less than 80 per cent qualified electors of the United States. This will throw out of employment boys who are carrying newspapers. For violation of the law a penalty is imposed of not less than $100 fine, and imprisonment for not less than 30 days.

SILOS

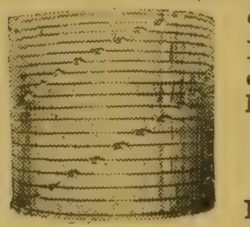
All sizes and dimensions made to order for your particular conditions.

This is a Photo of the 20x40 Redwood Stave Silo Manufactured and erected by us on the Sheldon ranch, Kenwood, California.



TANKS

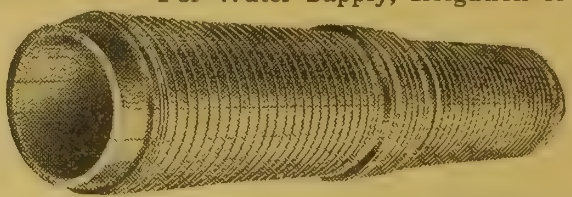
From 500 to 500,000 gallons capacity.



Built to suit All Uses and Users. Cheaper than Metal Tanks, last 10 times as long.

PIPE

Machine Banded or Continuous Stave. For Water Supply, Irrigation or Power.



All Designed by our expert engineers. Made in our own immense factory from clear, air-dried redwood, selected from Air-Dried Stock of 40 Million Feet, which we carry at our plant at ALL times. Write Us for Prices.

Redwood Manufacturers Co.

Fully Paid Capital, $1,000,000.00

8 04 KOHL BUILDING SAN FRANCISCO

Get All the Butter Fat

To operate at ***full efficiency*** and deliver ***all*** the cream, your separator must be lubricated with an oil exactly suited to its construction. Many oils form "gum", thereby clogging the delicate mechanism of the separator, and thus causing irregular spinning of the bowl, reduction of speed and consequent loss of cream.

Standard Hand Separator Oil

is made especially for cream separators by oil experts of 40 years experience who have studied the detail construction of the separator—this in order to produce an oil exactly adapted to the purpose. Your separator will do better work, last longer and need fewer repairs if lubricated with Standard Hand Separator Oil. ***No matter what you pay, you cannot buy a better oil for the purpose.*** Dealers everywhere.

BORAX WILL PREVENT THE TYPHOID FLY FROM BREEDING

As a result of experiments the specialists of the department of agriculture have discovered that a small amount of ordinary borax sprinkled daily on manure will effectively prevent the breeding of the typhiod or house fly. Similarly the same substance applied to garbage, refuse, open toilets, damp floors and crevices in stables, cellars or markets, will prevent fly eggs from hatching. Borax will not kill the adult fly nor prevent it from laying eggs, but its thorough use will prevent any further breeding.

The investigation, which included experiments with many substances, was undertaken to discover some means of preventing the breeding of flies in horse manure without lessening the value of this manure as a fertilizer for use by the farmer. It was felt that if some means of preventing the breeding of flies near a human habitation could be devised, the diseases spread by these filthy germ carriers could be greatly reduced. While the "Swat the fly campaign," traps and other devices for reducing the number of typhoid-carrying flies are of value, they are of less importance than the provention of the breeding. It was realized, however, that no measure for preventing the breeding of flies would come into common use, unless it was such that the farmer could use it on his manure pile without destroying its usefulness for growing plants, and without introducing into the soil any substance that would interfere with his crops.

As a result of experiments carried on at the Arlington Farms in Virginia, and New Orleans, Louisiana, the investigators found that 0.62 of a pound of borax, or 0.75 of a pound of calcined colemanite (crude calcium borate) would kill the maggots and prevent practically all of the flies ordinarily breeding in 8 bushels of horse manure from developing. This was proved by placing manure in cages and comparing the results from piles treated with borax and from untreated piles. The borax, it was found, killed the fly eggs and maggots in the manure and prevented their growth into flies.

In the case of garbage cans or refuse piles, 2 ounces of borax or calcined colemanite, costing from 5 cents a pound upward according to the quantity which is purchased, will effectually prevent flies from breeding.

While it can be safely stated that no injurious action has followed the application of manure treated with borax at the rate of .62 pounds for 8 bushels or even larger amounts in the case of some plants, nevertheless, borax-treated manure has not been studied in connection with the growth of all crops, nor has its cumulative effect been determined. It is therefore recommended that not more than 15 tons of the borax-treated manure should be applied per acre to the field. As truck growers use considerably more than this amount, it is suggested that all cars containing borax-treated manure be so marked, and that public health officials stipulate in their directions for this treatment that not over .62 (62-100) of a pound for 8 bushels of manure be used, as it has been show that larger amounts of borax will injure most plants. It is also recommended that all public health officials and others in recommending borax treatment for killing fly eggs and maggots in manure, warn the public against the injurious effects of large amounts of borax on the growth of plants. Purchasers of manure produced in cities during the fly-breeding season should insist that the dealers from whom they purchase give them a certified statement as to whether or not the manure in the particular car or lot involved in the purchase has been treated with borax.

In feeding to hogs garbage that contains borax care is also recommended. especially when the animals are being fattened for market. Borax is not a very poisonous substance and the feeding of garbage that contains it to hogs is not likely to be a serious matter. On the other hand borax in large quantities does produce gastric disturbances and for this reason a certain amount of care is advisable.

The method for using this substance in the case of stables is to sprinkle the borax or colemanite in the quantities given above, by means of a flour sifter or other fine sieve, around the outer edges of the pile of horse manure. The manure should then be sprinkled immediately with two or three gallons of water to 8 bushels of manure. It is essential, however, to sprinkle a little of the borax on the manure as it is added daily to the pile, instead of waiting until a full pile is obtained, because this will prevent the eggs which the flies lay on fresh manure from hatching. As the fly maggots congregate at the outer edge of the manure pile, most of the borax should be sprinkled there.

Borax costs 5 to 6 cents per pound in 100-pound lots in Washington, and it is estimated that at this rate it would cost only one cent per horse per day to prevent all breeding of flies in city stables. If calcined colemanite is purchased in large shipments, this cost should be considerably less. At the same time, if the borax is used on the manure only in the proportions stated, its value for use in the garden or for sale to farmers will not be lessened.

In view of this discovery, there now seems little excuse for any horse owner or resident of a city allowing typhoid flies to breed in his stable or garbage can.

It is believed that this information will greatly help the health authorities in their campaign against the typhoid fly. The health authorities have long tried to prevent the breeding of flies in city stables through the use of iron sulphate as a larvacide. In the case of iron sulphate, however, a large amount is required, and other insecticides, such as paris green or potassium cyanide, while effective in killing the flies, are very expensive or extremely poisonous. Borax, which is used freely in most households, and is readily available in all parts of the country, has the advantage of being comparatively non-poisonous and non-inflammable, readily soluble in water and easy to handle. It can be purchased at retail for 10 cents a pound, and a single pound used as directed in a garbage pail or open toilet may prevent the breeding of hundreds of dangerous flies.

The details of the experiments with borax and other larvacides will be found in United States department of agriculture bulletin No. 118.

HOG CHOLERA

Hog cholera is an infectious disease caused by an ultra-visible organism, the exact nature of which is not known. The organisms are taken into the body through the food or water, and the time elapsing between the exposure of an animal to the disease and the development of noticeable symptoms varies from a few days to three weeks.

How Spread.

This disease is very easily spread. It is most frequently introduced into a herd by infected hogs which are purchased but do not show symptoms of the disease at the time of entrance into the herd. Shipping hogs in infected cars or keeping them in infected pens will also cause the disease. The germs may be carried by dogs or coyotes which have eaten a diseased carcass, by birds which have fed in infected pens, or by persons who have walked through pens where diseased hogs have been. It is also believed by some authorities that the disease is sometimes spread through feeding hogs garbage containing uncooked bacon rinds.

How Prevented.

In case hogs have been exposed to this disease, the only known preventive is the use of hog cholera serum, which is injected into the tissues of the animal with a hypodermic syringe. This will render hogs immune. There is no cure for hogs which have become sick. They must be treated before they show a fever, for the serum to be of any use. More detailed information in regard to the serum treatment may be secured from the literature mentioned below.

Symptoms.

The symptoms of hog cholera are not claimed to be specific or constant, but any or all of the following are apt to be seen when a number of hogs are sick with the cholera, and they indicate with a degree of certainty the presence of the disease: loss of appetite; constipation, followed by diarrhea; marked weakness; staggering gait; labored breathing; convulsions; dicharge from eyes and nose; reddish spots on the belly; and a tendency to lie around or stand with the back humped.

Post Mortem Examination.

The only sure means of determining whether hog cholera is present is to examine the internal organs of a hog which has just died. The indications of cholera are small red spots on the skin of the abdomen, lining of body cavities, on the intestines, kidney and lungs. The lymphatic glands, as the ingunal, sublumbar, mesenteric, etc., are usually inflamed and enlarged. In chronic cases there may be ulcers on the lining of the small and large intestines and on the mesenteric membranes. The spleen may be enlarged and soft and the lungs may show inflamed and solid appearing portions.

Precautions.

Keep hogs under strictly sanitary conditions. The pens and troughs must be cleaned and disinfected frequently, and no wallow holes allowed to remain. Do not have hog pens near public highways.

If hogs are purchased from other herds they should be quarantined for three weeks, to ascertain whether they are free from disease.

The lots should be fenced with closely woven wire, so as to exclude dogs or coyotes which would otherwise be crossing the lots. If the disease is present in your community, do not allow neighbors or strangers to enter the hog lots.

If the disease appears in your or neighboring herds, it is well to procure serum and vaccinate all well hogs immediately. Read and become well informed on the subject of hog cholera.

Disposal of Carcasses.

If an animal dies, do not bury it or throw it on waste land. It should be burned. This is easily done, if thrown on a pile of wood and covered with kerosene.

Literature.

Bulletins treating the subject of hog cholera in detail may be obtained free from the experiment stations of the following states: Indiana, at La Fayette; Arkansas, at Fayetteville; South Dakota, at Brookings; Texas, at College Station; Nebraska, at Lincoln; Kansas, at Manhattan; and Minnesota, at St. Anthony Park, St. Paul.—W. S. Cunningham, Assistant in Animal Husbandry, New Mexico State College.

Let the dairy be as clean as your dining room, as milk is highly susceptible to odors and germs. There is absolutely no excuse for unsanitary conditions when care and a little expense will eliminate all defects.

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

and increase your milk production.

LARROWE'S DRIED BEET PULP

—provides an all-the-year succulent feed, containing more than five times as much nutriment as silage, greater digestibility, and in addition it is clean, bulky and palatable.

GET MORE MILK — INSTANTLY

When you start feeding Larrowe's Dried Beet Pulp you don't have to wait a week or a month to see results. You get an instant increase—from 1 to 5 lbs. more milk per cow a day.

Larrowe's Dried Beet Pulp is not a secret formula or expensive combination feed, but simply the pure shredded root of the sugar beet, with only the sugar and water extracted. It swells to six times its original bulk when moistened. Balances perfectly with alfalfa. Keeps indefinitely.

Thousands of dairymen are "cashing in" on this wonderful feed. How about you?

PROVE ITS VALUE WITH ONE SACK

LARROWE'S MOLASSES-DRIED BEET PULP

—is preferred by some feeders on account of its sweetness. Just the plain Beet Pulp with beet molasses dried. Fine for fattening, also for horses. Try one sack.

Go to your feed dealer today and get one 100-lb. sack and test it on one cow whose milk record you know. Be sure you get "Larrowe's" Dried Beet Pulp—the kind that is light in color, never blackened or burned.

"Profitable Feeding"

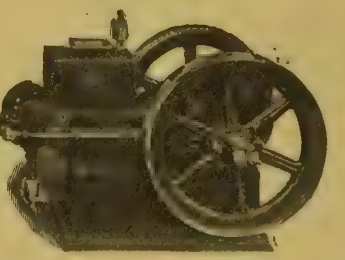
Selling Like Hot Cakes

A Big Hot Spark



A Quick Start

No Batteries No Coils No Troubles

ALPHA GASOLINE ENGINES are equipped with new gear-driven built-in magneto, which eliminates all batteries.

ALPHA ENGINES start on the magneto without turning them over and they require no cranking.

ALPHA ENGINES are low fuel consumers, with high efficiency, and are the highest grade, most reliable gasoline engine that money can buy.

ALPHA ENGINES are especially adapted for irrigation plants and they have that ability to stay on the job 365 days in the year and 24 hours per day.

ALPHA ENGINES CAN BE FURNISHED WITH SPECIAL CARBURETOR FOR USING LOW GRADE DISTILLATE OR TOPS.

ALPHA ENGINES were awarded the gold medal at the California State Fair last season and were in competition with about thirty-six other engines.

Investigate the Alpha before buying.

Written for the California Cultivator
By B. B. Wright, Riverside.

Answering your letter of July 22, in regard to keeping up the humus supply and assuming that by humus you mean organic matter of any kind in sufficient quantity to appreciably modify the physical nature of the soil, my experience has been about as follows:

Legumes Alone Not Dependable.

No dependence can be placed on leguminous plants in the long run in an orchard, as while frequently heavy crops are secured they cannot be counted on with any certainty for a winter cover crop. Frequently they will not start well, and sometimes they are destroyed by aphis, etc., before producing any quantity of material.

They cannot be depended on at all as a source of nitrogen, even when heavy crops are secured. In fact they seem, together with other cover crops, to deplete the available soil nitrogen (nitrate) for the critical period in the spring.

Rye Most Satisfactory.

My most satisfactory results have been from rye sowed with some legume, preferably vetch; most of the effect secured has, however, been from the rye.

Even heavy cover crops, if plowed in while green, have little permanent physical effect and can hardly be discovered in the soil in a few months. If, however, they are allowed to mature, at least until fairly woody, a very noticeable effect is secured which will last until another crop is grown.

To secure similar physical conditions from manure, an expenditure of at least $50 per acre annually would be required.

I have had no experience with straw, shavings or sawdust.

General Physical Effect.

Much of the effect of cover crops on the soil seems to be from the root penetration, and this cannot be duplicated by surface addition. The effect on the soil from a cover crop plowed in is much greater than from the surface application of any amout of material apparently as large.

I believe that the organic content of the soil can be maintained or possibly increased, and the fertility otherwise can be maintained by the use of the cheaper inorganic fertilizer material and cover crops plowed in every year.

Whether strictly speaking the above procedure adds to the humus percentage of the soil, I am unable to state. I am inclined to think that much of the modification of the soil observable is due to organic detritus preventing the compacting of the soil, rather than to actual humus. I doubt if there is much formation of humus in the upper layers of our soils which are disturbed so frequently by cultivation and aeration.

MAINTAINING HUMUS

Written for the California Cultivator
By E. L. Koethen, Riverside.

Your request for a letter on the question of maintaining the humus supply in the soil comes at a time when I have been giving it an unusual amount of study.

The writer is more than ever impressed with the fact that a much larger supply of humus is essential for our orchards. I have practiced growing cover crops on my lands for a long series of years, and the result is showing in the improved condition of the soil and the reduced cost of maintenance. Whereas, in former times a hard plowsole condition prevailed, so that irrigation water flowed freely from one end of the ranch to the other, and a very small stream sufficed to carry through, making it necessary to run five to six furrows between each row of trees in order to

Continued on Page 167

Profit in the Poultry Yard

FROM GOOD LAYERS

The Missouri state poultry experiment station has 50 or more pullets which have been hatched this year that began to lay when they were about four months old or a few days over that age. In every case, no matter what variety of poultry it happened to be, the first pullets of that variety to begin to lay came from the highest laying hens of that variety or hens among the highest layers. We have never had an early maturing and early laying pullet come from a medium or poor laying hen. In every case thus far, no matter what the variety is, the pullets which began to lay when they were from four to five months old were bred from the high laying hens of that variety.

The 13 which began laying first were: Three Buff Leghorns, two Barred Plymouth Rocks, four White Leghorns, one Ancona, one Campine, one Rhinelander and one White Orpington. The Barred Rocks and White Orpington weighed from three and one-half to four pounds each, while all others weighed from two and one-half to three and one-fourth pounds each. The first eggs weighed from one to one and one-half ounces each. The eggs are practically perfect in development. A Buff Leghorn pullet weighing two and three-fourths pounds began laying at four months and five days old, and a Barred Rock Pullet weighing three and three-fourths pounds began laying at four months and nine days old. These were the first two pullets to lay. The pullets are fed good, wholesome food, but not forced or stimulated. The food given consists of equal parts of cracked corn and wheat as a grain feed and equal parts of cornmeal, wheat bran and shorts fed in hoppers, and we mix one pound of fine salt to every 100 pounds of the mash. The colony houses are kept along the edge of a cornfield or on fresh ground in an orchard. We give the young stock sour milk or buttermilk if it is available, and if not, we add 10 pounds of dry beefscraps to every 100 pounds of their dry mash. At three or four o'clock in the afternoon we feed a moistened mash, all the birds will clean up in 20 or 30 minutes. We use the same dry mash as we feed in the hoppers, but moisten it with sour milk or water. We, of course, supply grit, oyster shell and charcoal by mixing them with the feed or by feeding separately. Pure water is before them at all times. Recently in culling 6000 head of young stock raised in this way to an age when some of the pullets had begun to lay, we found only two birds that appeared to be anything like out of condition.

From our observation and records we have concluded that the season of the year in which a chicken is hatched has much to do with its growth and development and the length of time that it will require for a pullet to mature and begin to lay. That is, pullets hatched in the early spring when the trees are budding, the grass beginning to grow green, the crops growing and the birds mating; in other words, when the whole earth seems to be putting on new life, pullets hatched at this season will begin laying in a shorter length of time than full sisters to them hatched in the summer or fall. We believe that pullets hatched in February, March and April will begin laying in a shorter length of time than their full sisters hatched in May, June and July in this climate.

The smaller varieties begin to lay a little earlier or mature a little quicker than the large varieties, as a rule, but by using good judgment, a breeder of any variety can so regulate his hatches as to have them mature just in time to make good winter layers. A poultryman can so select and regulate the breeding of his flock and so regulate his hatches that his pullets will bloom or begin to lay at something near a certain season, just as the florist has his chrysanthemums bloom at Thanksgiving and his lilies bloom at Easter. By all means have them begin to lay before the winter season, for if they do not, they will more than likely not start laying before spring. Such pullets are a dead loss for several months. The margin of profit in the poultry business is so small that it will not stand such a loss

SELECTION AND BREEDING WILL TELL

The fourth generation of chickens which have been hatched since the Missouri experiment station was established are now on the farm. The first year we trapnested a pen of Buff Leghorn pullets which averaged between 90 and 100 eggs each. We selected the best layers from that pen of 10 for our next year's breeders and mated them to a cockerel hatched from the best laying hen. We have kept and bred from the best layers and the best cockerels each year since that time. The result is that last year we developed a pen of 10 pullets which averaged nearly 200 eggs each and one laid 217 eggs, and now this year we have developed a pullet which began to lay when four months and five days old and was the first to lay out of 6000 or 8000 chickens reared on the farm this season. We have kept practically within the same line of breeding and by careful selection and mating, have practically doubled the egg yield in three years' time.

Another thing, it does not mean that you have to entirely disregard shape and color to breed a good laying strain of any variety. One of our contestants in the Buff Leghorn class from Michigan entered his birds in a good poultry show two weeks before our contest began last year. We now find that some of his highest scoring pullets and some of those which won the highest honors in the show room, are also those which have made the highest records in the contest by laying the greatest number of eggs. His pen is fine in color and shape as well as leading when it comes to the egg basket. Of course, we all know that after a pullet or hen has laid a large number of eggs, it tells on the appearance for the time being, at least, but that does not necessarily mean that these birds will never be in show condition again, or that their progeny will not be birds good enough to go into the show room. We have been impressed with the show qualities and the beautiful shape and color of one of the New Zealand pens of White Leghorns. This pen comes from a breeder who has won in the contests of that country and is now also making a good record here. We are quite certain of one thing, i. e., it is not necessary to breed a flock of mongrels for them to prove to be satisfactory layers.—Missouri Poultry Experiment Station.

POULTRY SURGERY

A most interesting report of an operation on a laying hen is sent out by the Missouri poultry experiment station. The operation removed six perfectly formed eggs from the body cavity.

Poultry surgery has not advanced to a degree that we can recommend it for this, that or the other thing, but you may be interested in an operation which was recently performed at this institution.

A Black Langshan hen remained on the nest most of the time and appeared to be broody. In removing her from the nest we could feel what appeared to be eggs in the body cavity and we could apparently hear the shells grinding against each other as we would knead the abdomen. She was a contest hen and we knew if this was the condition that it would probably be only a question of a short time until the hen would die and that it was our duty to try to discover and relieve the trouble if possible.

We proceeded to make an incision in the abdomen of the hen and, to our surprise, found six normal and hard-shelled eggs in the body cavity. They had developed and passed from the oviduct to the body cavity instead of being laid in the natural way. The body cavity was filled with these eggs. Six were removed and the incision sewed up, and at the present time the hen seems to be in good health. Just what the outcome is going to be, we cannot tell, but the hen appears to be healthy and happy. We believe the operation is going to be successful, and result in saving the life of a valuable hen. However, it may prove to be another case of where "the operation was a success, but the patient died." This is the third similar case that we have had with Black Langshans. The other two hens died before we discovered the real trouble. But we operated on this one and several days have passed and the hen seems active, healthy and happy. The external stitches have been removed and the wound healed and the hen is apparently well at this time.

JUDGES AT THE LOS ANGELES SHOW

From Secretary Mumford of the Poultry Breeders' Association of Southern California we have received notice of the judges and the classes to which they have been assigned for the Los Angeles show, Jan. 6-12, 1915:

W. S. Russell, Ottumwa, Iowa, Plymouth Rocks, Rhode Island Reds; C. G. Hinds, Oakland, White Wyandottes, Asiatics, Minorcas, Andalusians, Anconas, Campines, Lakenvelders, Cornish; Geo. W. Masterson, Duarte, all Wyandottes except White, Leghorns, Spanish, Partridge Orpingtons, Hamburgs, Houdans, games, bantams; A. G. Goodacre, Compton, all Orpingtons except Partridge, Dorkings, Red Caps, Buckeyes, Sussex, Polish, Buttercups, turkeys and waterfowl.

Sunflowers along the edge of a poultry yard will provide shade in summer and also produce some excellent feed for winter.

A study of the birds and an interest in each are essential to profitable poultry husbandry.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Fleas or Lice

Can you tell me how to get rid of fleas in my stable? They bother my horses, make them stamp and kick in the night and I get them on myself when I go in the stable.—Subscriber, Watsonville.

If infesting horses, these are more probably lice. However, thorough treatment in either case is much the same. Cleaning the stables from floor to roof is the first step. All cracks where dust is lodged must receive treatment, for decaying vegetable matter is the principal feed of these pests in the larval stage. After the clean-up, especially underneath floors, spray with whitewash in which is a liberal supply of carbolic acid, or spraying buildings with kerosene emulsion is excellent. Wash stock with tobacco tea or weak solution of tobacco extract. An ointment of lard and sulphur is also good to rid stock of the pests.

Horse Beans

Can you tell me the names of some growers of horse beans and their location? What is the best way of planting beans for fertilizer and how much per acre? — Subscriber, Anaheim.

Any seed man advertising in the Cultivator can supply seed of horse beans, but any producer of beans who may wish to get in touch with the subscriber may write this office. Cow peas or beans are usually drilled in closely, then furrows laid for irrigating after the plants are up. See this week's Cultivator, which is almost entirely devoted to cover crops.

Mites in Hay

I have some barley hay of last year's crop, and in opening bales I notice small white moths flying from them. And when I am around the hay I get covered with very small insects, not visible to the naked eye. I have had loose hay before infested with what was called by old farmers "hay mites." Do we have these in this state? If so how can we get rid of them?—Subscriber, Santa Susana.

This was referred to Mr. E. O. Essig of the state horticultural commission, who answers: "I am at a loss to know exactly what the trouble is, but the hay is evidently infested with one of the mites—the exact one it would be impossible to say, without specimens for identification. Fumigation would be the only possible remedy."

Gum on Apricots

I am sending you a block of apricot wood cut from an apparently healthy limb. I lost one tree last year and could find nothing else the matter with it, and this year I have two trees affected in the same way. —Subscriber, Redlands.

Try liberal application of lime about roots. Pulling dirt away from trunk and roots and applying perfectly air-slaked lime has been recommended, also scraping diseased portion and coating with Bordeaux paste, or some use acetic acid. The cause may be too much or too little moisture at roots or a number of things which cause an unhealthy condition

Small Potatoes

I planted an acre of spuds this spring and on harvesting them find they run largely to runts, scarcely one-fourth being of saleable size. Being green, I cut the seed very small, leaving only one eye. Would this account for the smallness of the tubers to any appreciable extent? What commercial fertilizer would you recommend for fall crop of spuds on light sandy soil and would you apply it now or at planting time?—Subscriber, Baldwin Park.

Undoubtedly the fact that you cut the seed too small has a good deal to do with your unsatisfactory potato crop. The reason for using large pieces or whole potatoes for seed is to furnish nutriment to give the plant a good start before it is forced to take up plant food from the soil. Consequently a plant that starts from a small seed piece is slower in getting started and less able to withstand unfavorable moisture or weather conditions. It is quite possible that insufficient moisture at a critical time, or improper cultural methods may have something to do with your results. We cannot tell you what commercial fertilizer you need to use without seeing an analysis of your soil. As a general thing manure applied the year before potatoes are planted is very beneficial. If you could manure an alfalfa field this fall and plow it up for next spring's crop you would have a good condition. Well rotted manure applied to alfalfa land to be plowed now and prepared for a fall crop would give you fertility enough, but scab sometimes develops on potatoes when planted on too recently manured land. Send a soil sample to Agricultural Experiment Station, University of California, Berkeley, and ask them to tell you which element of fertility is most needed and be guided by that in your choice of fertilizer. You may have plenty of everything but phosphorus. Then apply some of the most available phosphorus fertilizers for your fall crop. If you do nothing else, alfalfa sod and manure as suggested will help. A readily available commercial fertilizer should be applied at planting time.—W. S. G.

Dexter Cattle.

Regarding an inquiry as to Dexter cattle in this state we have the following from Professor Gordon H. True

Farmers, Attention!

WANTED: Location for seven $150,000.00 Condensed Milk Plants and twelve $115,000.00 Milk, Flour and Sugar Plants. We sell no stock or bonds, nor ask for free site. Show us you have natural surroundings to develop into dairy country if milk prices are such to make it possible to do so at a profit. Send full information of your advantages, pictures of farms, publications, books, etc., to

Hoover Potato Diggers

Equipped with Vine Separator

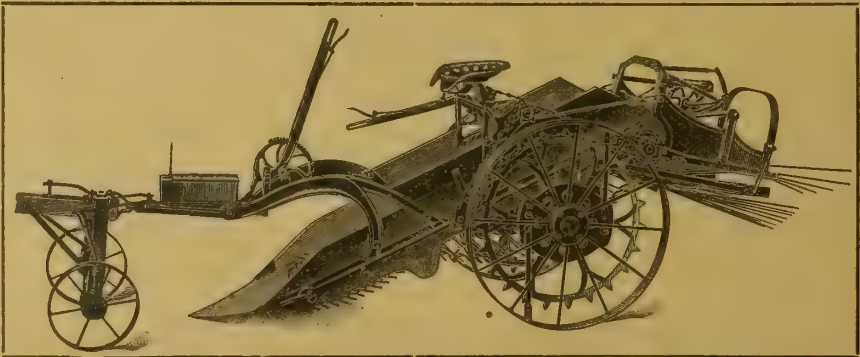
A Superior Machine

Does the Best Grade of Work

Handles Easily

A Long-Lived Machine

Will Stand the Hardest Wear



334 Hoover Potato Digger

The Hoover Potato Digger is a well constructed machine that will do good work under adverse conditions. Main frame bar is made of best quality gray iron castings with the axle and shovel bolted thereto.

High grade crucible steel shovel.

Beams are made of best charcoal malleable castings and bolt solid to the main frame. Hoover Diggers give the best results. Most popular digger in potato growing sections. Ask your John Deere dealer about this Digger, or write to us for particulars.

John Deere Plow Company, San Francisco, Cal.

of the university farm at Davis: "Relative to Dexter cattle, in so far as I know, there are no herds of this breed in the state. In fact I know of none anywhere in the west and I am of the opinion that the few herds in this country are in the eastern states. These cattle weigh from 600 pounds to 700 pounds, as you know, and are hardly adapted to any other use than that of family cows. The average yield of milk is said to be about three gallons a day, producing six or seven pounds of butter fat a week." The native home of the Kerry or Dexter is western Ireland among the Kerry Islands. Plumb, in Types and Breeds of Farm Animals, says: "The true Kerry is a small breed of dairy cattle. The color is black, though red sometimes occurs. White may occur about the udder or scrotum, but is not desirable. The lean head carries upstanding slender white horns with black tips. With cows the neck is slender and long, the body of moderate proportions, the legs fine and long, and the udder large with medium-sized teats. In size this is one of the small breeds; the cows often weigh from 500 to 600 pounds, and frequently do not exceed 40 inches high. The bulls are larger, weighing 800 to 1000 pounds. The Dexter-Kerry is of unknown cross. Some authorities think that a Mr. Dexter nearly a century ago developed the breed by crossing Kerries on other stock. Some others regard it as a result of selection. This type is more blocky, shorter legged, heavier of head and neck, and more beefy in type than the true Kerry, and, as seen by the author, much smaller. The color also is variable, being black, red, or roan. There are wider variations among the Dexter-Kerry branch than in the true Kerry. In each case the udder is unusually well developed, showing large capacity in proportion to size of body."

Giant Dolichos

I send leaf and flower from vine. What is its name? Is it of any use except as an ornamental? It grows rapidly and the flowers are formed in large clusters. It is not common here. No one seems to know its name.—Subscriber, San Diego.

This is Dolichos lablab, variety purpurea, sometimes called hyacinth bean. It is a tropical twining bean, one of many forms of the same family. We have never heard of its being of any value other than as an ornamental. In mild seasons it will live through the winter, but generally has to be planted each spring.

Settle This Water Question Now!

When you install a Krogh Pump you have permanently settled the question of a dependable water supply. No matter what depth your wells may be, there is a Krogh Pump exactly suited to your needs. We would like to counsel with you—advise you regarding your equipment. Our complete engineering staff is at your disposal. Booklets: 85B about Turbines—78B about Verticals and Horizontals—are free.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Obstructed Milk Duct.

Have a cow just fresh, but can get no milk out of one quarter. There seems to be plenty of milk there, but it will not come out. The cow has good appetite and no fever. Her udder was always in good shape. There are no signs of any bruise or hurt. This is her second calf. Is there anything that will start the flow of milk?—Subscriber, Woodland.

There is an obstruction in the teat that has closed the duct. We do not know why but sometimes while a cow is dry a small lump or tumor grows in a teat and closes the duct. The tumor may be in any part of the duct, but the nearer the end of the teat the easier it is to treat. First use a milk-tube and push it through the obstruction. This will allow the milk to flow through the tube, but will afford only temporary relief as the opening through the tumor will close again so you would have to introduce the tube every time you milk the cow. Every veterinarian should have a small instrument for removing such tumors. It is about the size of a milk tube and has a small blade concealed in it that can be pushed out and used to cut the tumor while the instrument is in the teat. Once the tumor is cut out there is seldom any further trouble. Nature provides for the absorption of the milk and she will go on all right if not treated, but you will lose that amount of milk.

Sick Cow.

Have a Jersey cow ten years old, fresh about three months. Two weeks ago she suddenly became stiff. The symptoms were no milk, short breathing as if in pain and she appeared to have a swelling or obstruction in the throat. Thought she was choked on a cabbage stump as she had had access to the cabbage patch. Inserted a piece of hose with some difficulty but could not tell whether we forced anything down or not. The cow refused to eat for about four days, but now is eating and drinking very well but can not raise a cud. She will go through the motions but nothing will come up. She has alfalfa pasture and grain, but licks dirt and chews dry willow branches and leaves. Have given her salts and salt and the bowels and kidneys seem natural. There is evidently something wrong beside the throat trouble and she craves something. What is wrong and what can we do for her?—Subscriber, Rio Bravo.

You have given a good description of the symptoms that we find when a cow has swallowed a piece of wire and it has punctured the stomach and gone through into the lungs. Cows will sometimes pick up a rag or piece of twine that may be attached to a wire and chew and swallow the whole thing. Of course that does not happen often, but quite a number of such cases are on record with the symptoms that you describe. In time, if it is a wire, it may puncture some of the vital organs and cause death. The only advice we can give is to give a pint of raw linseed oil once a day to keep the stomach and bowels active.

A NATIVE

Regarding coccus citricola, on which there has been given considerable information, and otherwise, Mr. William Phillipson of Monrovia believes that this insect is a native of this state. He says that he has seen it in many canyons of Southern California and knows that it thrives on native trees and shrubs.

Ranches, homes, acres, lots, exchange; send for free list. Wilson Bros., Santa Cruz.

POULTRY

CROLEY'S POULTRY CONDITION POWDER

is a wonderful help during the molt.

Try some. Your dealer has it.

How to Make Money—Mrs. A. Basley's latest Poultry Book is without exception the best ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1. Order from Cultivator Publishing Co.

For Sale or Exchange—Wanted, 100 pullets, Plymouth Rocks, R. I. Reds or Orpingtons, to feed my Burbank Spineless cactus to. You want the cactus, I want the chicks. 50c slabs for 50c pullets. Address or ship to H. L. Bauers Cactus Ranch, 4401 Hummell St., Los Angeles, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., successors to Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

Barred Rock Cockerels (Hawkins' Royal Blue Strain) ready for fall mating. All the popular breeds of baby chicks every week after Aug. 15th. Order early and avoid the rush. Enoch Crews, R. 1, Santa Cruz, Cal.

Barred Rock and R. I. Red baby chicks. If you want to raise some broilers send me your order. Price $10.50 per 100 until September 15th. J. W. Lyon, Gardena, Cal.

Barred Plymouth Rocks — "None better." Special prices for May and June. Write for 'em. C. H. Vodden, Los Gatos, Cal.

MISCELLANEOUS.

For Lease—Dairy ranch, 160 acres; 85 alfalfa, 35 grain, balance pasture with shade and firewood. Alfalfa and grain land all leveled and ditched, using wooden gates in ditches, also using 2200 feet 14-inch cement pipes. Ten H. P. motor, centrifugal pump, reservoir. Good six-room house, two sleeping porches, electric light, water piped. Tank house, garage, horse barn, and will build milking barn. Located six miles from Wasco, seven from McFarland, two from Elmo, 11 from Delano, Kern county. $1800 per year, tenant to pay power. Furnish references and security. W. F. Marks, 226 South Main St., Los Angeles, Cal.

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

A SOLAR FOOD CONSERVER

This inexpensive appliance intensifies the heat of the sun and uses it to sterilize and preserve fresh in every way, and to cure all kinds of deciduous fruits and vegetables. This invention opens a new home industry for making crystallized fruit confection for sale. Purchasers report having sold as high as $75.00 per month in this way. Write for prices and particulars to E. E. Dow & Co., Redlands, Cal.

FOR SALE
Perfectly equipped
propagating plant,
fine opening for an
all round man. Plenty
of deciduous and olive
budding.
Box 63, Rialto, Cal.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

WANTED.

Wanted—Steady position by expert in pruning and new style budding and grafting; any kind of trees or roses. Work guaranteed. Mike Detore, 138 South Los Angeles St., Los Angeles, Cal.

Wanted—Practical, scientific citrus man wants charge of grove; 10 years' California experience. Also understands general farming. Married; no children. Address Box C, Cultivator Office.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

Household Department

THE THINKER

Back of the beating hammer,
  By which the steel is wrought,
Back of the workshop's clamor,
  The seeker may find the Thought.
The Thought that is ever master
  Of iron and steam and steel,
That rises above disaster,
  And tramples it under heel!

The drudge may fret and tinker
  Or labor with dusty blows,
But back of him stands the Thinker,
  The clear-eyed man who Knows;
For into each plow or saber
  Each piece and part and whole,
Must go to the Brains of Labor
  Which gives the work a soul!

Back of the motor's humming,
  Back of the belts that sing,
Back of the hammer's drumming,
  Back of the cranes that swing,
There is the eye which scans them,
  Watching through stress and strain,
There is the Mind which plans them—
  Back of the Brawn, the Brain.

Might of the roaring boiler,
  Force of the engine's thrust,
Strength of the sweating toiler,
  Greatly in these we trust.
But back of them stands the Schemer,
  The Thinker who drives them through,
Back of the Job—the Dreamer
  Who's making the dream come true!
—Berton Braley, in the American Magazine.

NEIGHBORS

(Concluded from last week.)

There was Bogue, who to his own journeys to town cheerfully added two more trips a week with his neighbor's vegetables and fruit; all the little Bogues, who helped pick them; Lacy, who got in the hay; Jenkins, who weeded and cared for the vegetable-garden till it was too dark to see; and Hudson, who looked out for the chickens, turkeys and geese, There was no one who did not willingly give his time and labor.

In the kitchen the wives held sway; they attended to the washing and cooking, and saw that the strength of the nurse did not give out. For the nursing devolved on the wife alone. All the helpers had asked that Silas should not be told, and Henrietta Green recognized the wisdom of the request. She toiled through the days and nights as best she could, and snatched a little rest only when her querulous patient slept.

But there came a day when the sick man needed the attendance of others besides herself; when the eyes of Silas rested unseeingly on the face of his wife; when her strength was as that of a child, opposed to his delirious struggles. Then the men came in pairs, and relieved one another in turn, so that none should feel the burden of the work too heavily.

Those were dark days; days of fear and prayer; days when Henrietta feared for the night to fall; nights when she dreaded for the day to dawn; days when the eyes of the doctor would not meet her own; days when he came four or five times; one fearsome night when he kept watch beside her. She went through it all in tearless agony. But the next morning, when he drew her outside the door, and whispered in her ear, "Henrietta, he'll pull through now," it was more than she could bear. and she wept out her relief and joy on Mary Johnson's bosom.

Then came the days of convalescence—by no means the easiest time for Henrietta. But she threw herself into the task of cheering and coaxing her patient. She laughed and cajoled his restlessness away. She humored him as she would have humored a sick baby.

Gradually, as he became stronger, his neglected work began to trouble him.

"When will the doctor let me get up, Henrietta?" he would say. "And when'll he let me eat?" I'm so hungry I believe I could eat a house. I never want to see milk again; I want beefsteak and onions, and ham and eggs—that kind of thing. I'm pining for 'em. And I want to be up so! There's the hay—it'll be a dead loss. How long is he going to keep me here? Can I get up tomorrow I'm so hungry—"

Mrs. Green never lost patience. She evaded his questions, and did her best to soothe him. It was a proud day for both when the doctor let him get up. He was only a shadow of himself. He looked long at his thin, white hands.

"If I can't farm, Henrietta, I allow I can get a place in the circus as the living skeleton soon," he said.

His wife's old, cheery laugh rang out. He looked at her, and for the first time saw the change in her. There were lines that anxiety had traced in her comely face; the weeks of confinement had made her pale; but her lassitude was gone. Her eyes were bright, her step was quick and eager; it was as if the joy of living encompassed her once more. As Silas watched her, his heart swelled with gratitude and love.

Slowly, as he shook off the enfeebling effects of his illness, his mind became more alert, and he noticed her constant evasion of questions about the work. He was aware that the shade of the southeast window, which looked out on the garden and a grain-field, was always pulled down. Craftily he tried to find out the reason for it.

"Did the doctor say I was to get well without any sun?" he asked.

"Now, Silas, the sun just streams in the other window in the afternoon. Don't be hankering after the morning sun, too. You ain't strong yet."

He let the subject drop for the time, and she breathed easily again. Dreading the effect that the sight of the workers might have upon him, she never left him alone longer than a few minutes.

But one day Mary Johnson went home without a receipt-book that she had asked for. "And she wants to get those plums put up right away." Mrs. Green said to herself. "She's behind with everything. I believe I'll give Silas a real entertaining book, and run over there. 'Twon't take long, and I haven't been out of the house for months."

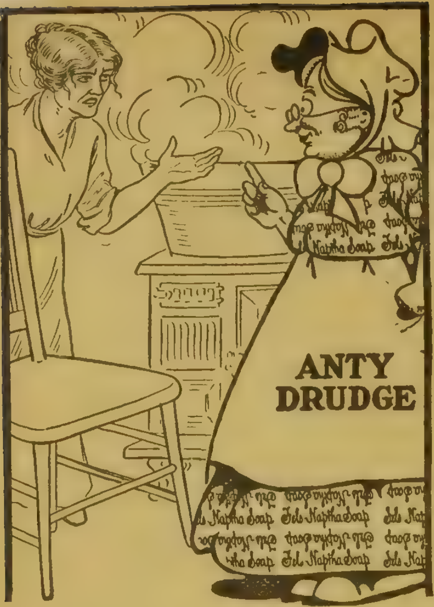
Before she went, she made him promise not to pull up the shade, although at the moment no one was working in the fields. She did not observe that his eyes failed to meet hers, and that the promise about the shade was the only one he gave.

She had not been gone long before Silas had searched in the closet and found an old cane. Leaning on it, he took his first feeble steps away from the sick-room.

"I'm bound to see," he said to himself. "Of course everything's about ruined, but I believe it hurts me worse not to know than it would to know."

Yet eager as he had been to see, he found it hard to turn his eyes toward the desolation that he felt sure was there. When at last he did look, he saw with surprise that there was no desolation. The thrifty vegetables, in all stages of growth, appeared as well cared for as they were when he had been taken ill. Everything looked the same. He drew his hand across his puzzled eyes. It was as if only a night's sleep had lain between him and his garden. But when he looked for the waving, golden grain, the weeks of illness loomed up again. There was no grain to be seen.

He turned his tottering steps toward the barn. The short walk was tiring him; the strangeness of the situation lay like a cloud upon his mind. But at the door of the barn the cloud cleared, and the solution of the puzzle was before him. James Johnson, whistling gaily, was milking the brindle cow. The two men saw each other at almost the same moment. Silas leaned against a feedbox and spoke sharply:



Mrs. Peevish—"I declare, I'm ashamed to ask you into this smelly place, Anty Drudge, but you know how it is on washday, with boiling clothes filling the room with steam. I'm just sick with the odor, and I'm about ready to give up."

Anty Drudge—"I think it's time you did give up your old-fashioned notions. Nobody up to date boils their clothes these days. They use Fels-Naptha Soap in cool or lukewarm water. There's no chance for disagreeable smell then. The only smell to Fels-Naptha is clean smell."

When you wash with Fels-Naptha Soap and cool or lukewarm water, you don't breathe in sudsy steam, nor fill your house with the smell of boiling clothes—and you get your work done easier, better and in half the time than ever before.

Fels-Naptha dissolves grease and makes dirt and stains vanish. It's just as good for all kinds of housework as it is for washing clothes.

Buy it by the box or carton and follow the easy directions on the Red and Green Wrapper.

Fels & Co., Philadelphia.

BERNARD, HEWITT & CO., Tailors,
564 West Monroe Street, Desk 378 Chicago, Ill.

"Will ye tell me how ye come to come on my property?"

The intruder looked embarrassed.

"Why—why—" he faltered, "I allowed you needed me. And I didn't think you'd know."

"So when a man's down," Silas said, "and can't help himself, you come sneaking in—"

James Johnson interrupted him. "Mis' Green knew," he said.

"Sneakin' in," went on Silas, as if the other had not spoken, "doing the work of the man who—who talked to you hasty, who you haven't no call to do it for—who—who—who's plum ashamed," he concluded, putting his old hands over his face like a hurt child. "I didn't think, Jim, you'd go to — make me — feel — as mean — as this."

"Why, neighbors are neighbors," said James Johnson. "What we owe to 'em's plain as day. 'Twasn't only me — we've all been over — Hudson and Lacy—Jenkins and Bogue. We did what we could—we were glad to. 'Twasn't anything, anyhow. Any one's willing to help. You tried to help me, but I was too pig-headed to listen."

The old belligerent light gleamed in the wet eyes of Silas Green.

"I surely did," he began. "You'll never have a crop till you do as I say, and—"

"I know!" interrupted the other. "I'll change and get rid of the black spots this year."

"So'll I," said Silas Green, reaching out a hand as if to seal a bargain.

"Why, you haven't got any!"

"Yes, I have, Jim. You showed 'em to me. But they're on me, not on the fruit. They're deep set. They'll be hard to get rid of. But it's got to be done. It's no more'n a man owes to his neighbors."—Youth' Companion.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Chilled Cantaloupe
Eggs with Rice
French Toast, Strawberry Jam
Coffee

Lunch

Cream of Pea Soup
Potato-Pimiento Salad
Sliced Cold Ham
Graham Rolls Baked Peaches
Tea or Milk

Dinner

French Lamb Chops Peas in Cream
Mashed Potatoes, Browned
Cucumber, Lettuce and Onion Salad
Frozen Peaches
Baby Baltimore Cakes
Coffee

Strawberry Jam.

Take equal quantities of berries and sugar. Dissolve sugar in hot water and boil until it will spin a thread. Pour boiling water over the berries, let stand for a few minutes, skim out and place in jars or glasses. Fill jars with boiling syrup and cover with paraffine. If liked a few drops of lemon juice may be added to the syrup.

Baked Eggs With Rice.

Soak rice over night, put into briskly boiling salted water, boil 15 minutes covered, then remove cover and let dry out. When tender and dry (it may be necessary to pour off some of the water) take out, place in individual baking dishes and drop an egg in the center of each nest of rice. Pour over a spoonful of cream and set in hot oven until the eggs are set.

Potato and Pimiento Salad.

Take four medium sized boiled potatoes, two hard-boiled eggs, one-half can pimientos, one tablespoon chopped pickle, some chives and one teaspoon salt. Boil and slice potatoes, add chopped pickles, eggs and pimientos. For the dressing mash yolks of two hard-boiled eggs, a pinch of mustard and a little salt. Mix smooth with vinegar, then add cream to make the desired quantity, adding a little more vinegar at the last if not sour enough.

Baby Baltimore Cakes.

Beat one-fourth cup butter to a cream, gradually beat in half a cup of granulated sugar, the beaten yolks of four eggs, one-fourth cup of milk, the grated rind of one orange, or half teaspoon orange extract. Lastly add one cup sifted flour, less two tablespoons sifted again with two tablespoons baking powder. Bake in a well buttered pan 15 to 20 minutes.

Icing.

Dry six macaroons in a warming oven, roll and sift. Melt one and a half cups of sugar and a pinch of baking powder in half a cup of boiling water, let boil until a long thread will spin from the spoon. Beat whites of two eggs, pour on the syrup slowly in a fine stream, beating constantly. Tint a delicate rose color, flavor with half a teaspoon vanilla and a few drops of almond extract, mix with the macaroon crumbs and frost cake.

TO CURE FACIAL BLEMISHES.

We often see an otherwise good complexion marred by acne or blackheads, though it is said that if the face is washed as it should be no blackheads would appear, and with no blackheads there would be no enlarged pores. The face is made of tiny little pores, each one a tiny opening which would not ordinarily show, and unless the face is kept absolutely clean the dirt gets into these tiny openings and increases in amount until the pores are enlarged and the blackheads formed.

Pimples are another result of enlarged pores, as the dirt and foreign substances in them cause the pores to become inflamed and these become pimples. Hard water should not be used for face washing. The mineral deposits in it harden the epidermis and render acne almost ineradicable. After a long trip in the dust the accumulated dust on the face should first be removed by a simple cold cream, and only pure refined soap should be used on the face. A face cream at night and a soft bathing every day in water made milky with tincture of benzoin will improve the worst complexion, and an excellent remedy for enlarged pores is made with one dram of boric powder dissolved in four ounces of distilled witch hazel. For greasy or shiny skin use equal parts of boric powder and chalk as a face powder. With care flabby cheeks can be made firm and round by the constant feeding of the pores and rubbing upward. Thick sweet cream makes a fine skin food, and pure, fresh goose grease or poultry fat of any sort, with a little spirits of camphor added, is a good and safe skin food.

The juice of green grapes is said to remove freckles, also tansy leaves soaked in buttermilk over night. Most acids will remove freckles for a time; too much acid on the skin is liable to make wrinkles, while a little is beneficial.

An excellent lotion for removing blackheads consists of boric powder one dram, alcohol one ounce and rosewater two ounces. This must be applied with a soft cloth and allowed to dry on the skin. To remove pimples, wash the face at night with castile soap and warm water, then use a lotion made by dissolving one teaspoon of boric powder in a cup of boiling water and this must be used night and morning. Some things that are used for removing facial blemishes are very injurious to the eyes, but there is nothing better for the eyes or the complexion than this boric solution. It is good for rashes and all irritations of the skin, and you can cure a blemish and get rid of a mole or liver spot once for all by devoting a little time to giving them the right treatment once or twice a day.—M.A.H.

Books

This list of helpful, instructive and interesting books is prepared by us with the purpose of enabling the Cultivator readers to supply themselves at the lowest possible cost. The great value of many of these is so well known as to need no comment from us. Some of the new books which we have added to the list this year deserve special mention. "Co-Operation in Agriculture," by G. Harold Powell, should be in the hands of every producer of farm products. "Farm Sewage," by Santee, will aid many in solving a perplexing problem. "Farm Manures," by Thorne, is decidedly valuable. We state sincerely that no orchardist can afford to get along without "The Pruning Book," by Bailey. We have had much inquiry for a book on keeping farm accounts—we can supply a good one now. The imported book, "Insecticides, Fungicides and Weedkillers," by Bourcart, is a marvel of completeness. The rapidly increasing use of gasoline engines, automobiles and tractors by the farmers has demanded reliable treatises on these subjects. "The Gasoline Engine on the Farm," by Putnam, "The Modern Gasoline Automobile," by Page, and "Traction Farming and Traction Engineering" are exceptionally complete, well illustrated and easily understood. Don't overlook the "Cement Workers' Handbook"—it's "worth its weight in gold." Every book on this list has the endorsement of the California Cultivator.

HAY

Under date of August 8 Scott, Magner & Miller say:

Receipts of hay for the past week were 4234 tons. Very little choice hay is to be had, and this is disposed of without difficulty, although the poorer grades keep the level of prices down.

Consignments of hay for shippers' account are heavy. Alfalfa sales have been rather light for this season, but the demand is also light.

Fancy Wheat Hay, lt. bales	11.00@12.00
No. 1 Wheat or Wheat and Oat	9.00@10.00
No. 2 Wheat or Wheat and Oat	7.00@8.50

Citrus Fruit Market

LOS ANGELES, August 12, 1914.

While lemons are going out of sight oranges are in the dumps. Great quantities of deciduous fruits combined with the uncertain financial conditions induced by war have proved desperately discouraging to the Valencia market. Good stock of regular sizes is still commanding close to the $2.00 f. o. b. basis, but close observers fear it will be worse before it is better.

The same conditions which are proving so discouraging to oranges will probably boost lemons to exceptionally big prices. Instead of hundreds of thousands of boxes of foreigns being afloat, there is not a Mediterranean lemon in sight. California, with an exceptionally light supply, will have practically the entire U. S. market.

Shipments.

Shipments of oranges to date from Southern California since November 1, 1914, 34,613 cars; lemons, 2,541; total, 37,154. To same date last season oranges, 12,540 cars; lemons, 1,947; total, 14,487. Total citrus fruits two years ago this date, 32,705.

NEW YORK, Aug. 10.—Nineteen cars Valencias, two mixed cars sold. Market is slightly better. Fair and warmer.

MAINTAINING HUMUS

Continued from Page 160

apply the amount of water necessary for an irrigation, now we apply the same amount of water in three furrows on heavy clay loam soil with the necessity of opening several flume holes for each furrow in order to get the water through. The result is a thorough irrigation without melting the soil down to an adobe bed, and cultivation is a much simpler matter. The soil instead of being lifeless and inert is flocculent and mellow, acts like a sponge in holding water, and the vegetation growing upon it makes a good vigorous growth. But still I am not satisfied. I want still more humus and less orchard work. To this end I am conducting experiments with summer crops.

Green Crops What We Want.

I have been greatly interested in the controversy about mature or green crops and this is part of the key to the answer to some of your questions. I am convinced that Prof. Lipman is absolutely right in maintaining that green crops are what we want. It has been said often that because the green material soon disappears from sight after being plowed under, it is lost. I know positivly that this is not the case. I have always practiced plowing the cover crop under green, and am getting increasingly good results. The fibrous material produced by dry mature cover crops has developed the cellulose, and cellulose in the soil retards nitrification, and we should be cautious at what time we apply such material to the soil. If it is applied when the trees are carrying "the peak of the load" in making the greatest growth of the season the trees will be robbed of the food necessary for them. Or if at fruit setting time the trees will not have the strength to retain the crop and dropping will result. A heavy cover crop left until April for plowing under will be mature enough to be a cellulose crop and will retard nitrification to the degree of robbing the trees of their rightful food at the time when they need all they can get. So also in applying straw. There will be a period after its application, lasting a month and more, when nitrification will be retarded, and the trees will for that period have less available food than before its application. For this reason, we prefer to apply it in the fall so that it will be converted, or well on the way, before growth begins. Or better yet, if the straw is first used as an absorbent in the stable, it will decay more quickly, and for that reason may be applied later in the season.

Various Sources of Humus.

The use of shavings and sawdust as sources of humus is in my mind of doubtful expediency. They are more fully cellulose materials than the others mentioned and decay very slowly. Doubtless in course of time they will be available as plant food, but the process is too slow.

There is a movement at this time for growing alfalfa in the orchard. For citrus orchards, unless some new method of application is discovered, it is bound to fail, and perhaps lead many unsuspecting ones into error. We have seen it tried many times, and in every case it injured the orchard.

Manure of course is an ideal source of both plant food and humus. But the supply is not equal to the demand, making the price often prohibitive.

I believe that all these materials should be plowed in deep so as to provide for quick and thorough decay. They are of no food value until they are decayed, but they still serve us as humus long after they have disappeared from view to the casual observer.

Advantage of Winter Growth.

I have not tried buckwheat, but it seems good as a summer crop. The fact that it grows rapidly is in its favor, and the self sowing feature is good. There are several kinds of bean crops that deserve consideration; cow peas, perhaps the tepary bean, and others. I would not forget that the legumes are preferable where they can be grown, and would not allow the summer crop to take the place of the winter legume crop. The legumes yield atmospheric nitrogen, the winter crop prevents washing during torrential rains and is grown at a time when the trees are dormant or near so. They also take advantage of the greater supply of water. Our experience however teaches us that with the use of cover crops we may by persistent use increase the water holding power of the soil to the extent that a much smaller aggregate of water will suffice, though it may take a much larger volume to give an irrigation, by spreading the times of irrigation over longer periods.

Experiments with Corn.

In a recent conversation with Mr. I. G. McBeth of the United States department of agriculture, who is working here on the problem of nitrification in the soil, he made the remark that it is a peculiarity of corn that the available nitrogen is not depleted during its growth. This has led me to try corn as a summer cover crop, to be plowed under when still green and succulent. I have sown it broadcast and furrowed deeply after a good irrigation. Am using white field corn and amber sorghum in this experiment. It promises to produce a large amount of green material.

I am also trying out the Whippoorwill and Blackeye peas at the same time. During this experiment the nitrogen content of the soil will be kept track of so that we will know whether the surmise is correct that the corn will not take the available nitrogen from the trees while it is growing. If this should prove true it will be a big gain, for one of the main objections to summer cover crops is the danger of robbing the trees when they need all the nourishment they can get to carry on the rapid growth of both tree and fruit.

In order to further carry out this line of experiment I have also planted a block to a quick growing sorghum, using the amber sort. Should this prove satisfactory it will be less expensive for seed than the corn.

In conclusion, I wish once more to emphasize the conviction that the largest fertilizer problem we have is the proper maintenance of a humus supply. With this solved, we will have no plow sole, no scarcity of water, reduced fertilizer bills, and a reduced amount of labor in cultivation.

MEXICO
To Investors and Those Who Are Looking for Homes:

For the next 30 days we offer our lands situated just across the line in Sonora, Mexico, from $10 to $15 per acre.

This property is located on the main line of the Southern Pacific Railway, one day's ride from Los Angeles. It is especially adapted for the raising of wheat and for general farming. Two crops are grown annually. No irrigation necessary. Fine soil and beautiful climate. This will not only prove to be a number one investment, but a beautiful home can be made at very little expense. Hundreds of people are investigating this new country, and large numbers have already purchased. Call or write for literature giving full details.

Motor Cars and Trucks of Merit

The mark of quality

The mark of quality

The Thos. B. Jeffery Co. is devoting itself to the production of motor cars most modern in their mechanical superiority, unexcelled in quality and quite distinctive in up-to-the-minute style and beauty.

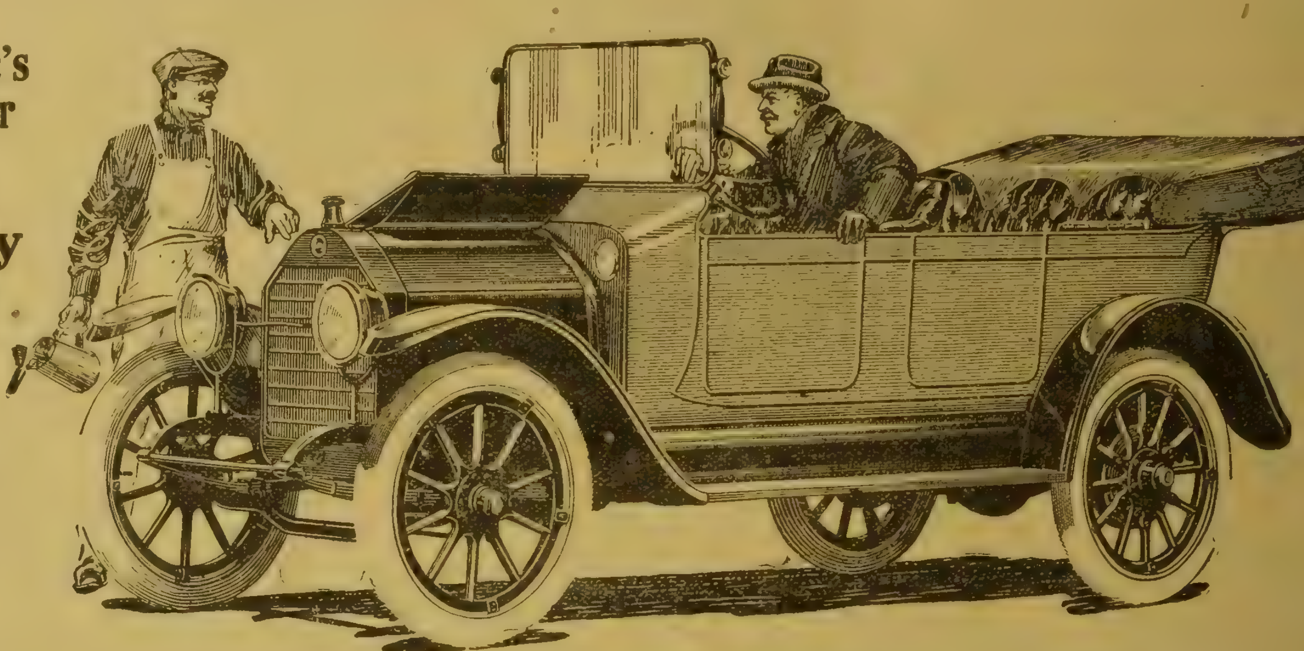
The success of the Jeffery Four, the first high grade, light weight, economical car of quality to be sold in America at a moderate price, has enthroned this car as a leader among Fours.

Its distinguished companion, the Jeffery Chesterfield Six, will, through the possession of the same inherent quality, naturally command the same position among Sixes.

It would not be possible for the Jeffery Company to maintain this leadership through adherence to the old annual model policy. It is the purpose instead to give Jeffery owners the best motor car they can possibly build with complete disregard of all projudices of engineering design or selling policy.

The Mechanic's Ideal Car

The Jeffery Four



$1575
Los Angeles

Your neighbors judge you by the things you do: The way you keep up your farm and the buildings and barns. The kind of farm machinery, cream separators, etc., you buy. And by the motor car you drive. Why have the outward appearance of prosperity—good farms, well painted houses, trim, well-kept fields, up-to-date-farm machinery, and cheap, uncomfortable automobiles?

You owe it to yourself, to your family, to have a car in keeping with your standing in your community. You need not buy an expensive car; if you do you will doubtless get a heavy car. That means big tire and oil bills and short mileage for a gallon of gasoline.

Get over the habit of thinking of motor cars by price. You know yourself that it would cost one manufacturer $2000.00 to build the identical car that some better-equipped and financed concern could build for $1500.

Get from some expert mechanic his statement of the things that a good car ought to have, and then start out to find a car that has them.

This line of investigation is going to bring you to the Jeffery. But don't accept the fact that Jeffery quality is 100% because this advertisement says so. See it for yourself and make a salesman show it to you.

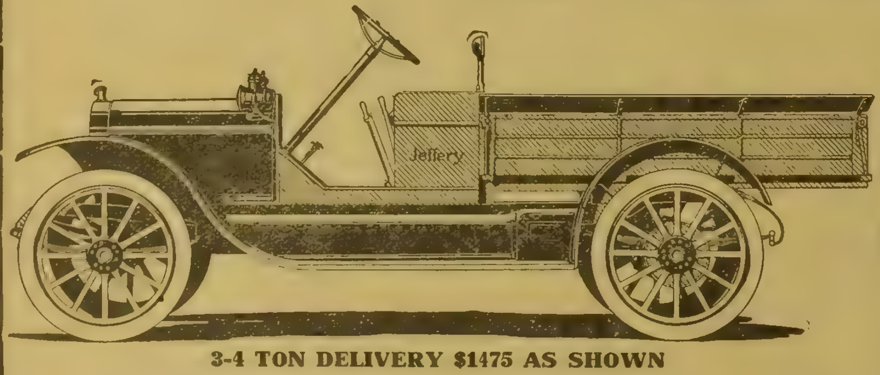
When you make comparisons you will be surprised at the quality in Jeffery cars and the price of the Four is only $1575, Los Angeles.

This car is built to a standard and not to a price. A few items of specification are as follows:

High speed, high efficiency, four-cylinder motor cast enbloc—3¾x5¼. 38 H. P. U. S. L. starting and lighting system. Duplex Bosch magneto. Rayfield carburetor. Four forward speed transmission. Daimler leather coupling. Spicer universal joints. Full floating rear axle. Imported annular ball bearings throughout. Rich Tungsten steel valves. Cone clutch. 116 wheel base, 34x4 tires, demountable rims. Left drive, center control. Rothschilds body, finished Brewster green. Never-leak top. Weight 2850 complete. Chrome nickel and vanadium steels only.

Wonderful Quad 2 Ton Truck--4 Wheel Drive--4 Wheel Steer--4 Wheel Brake--Chassis $2950

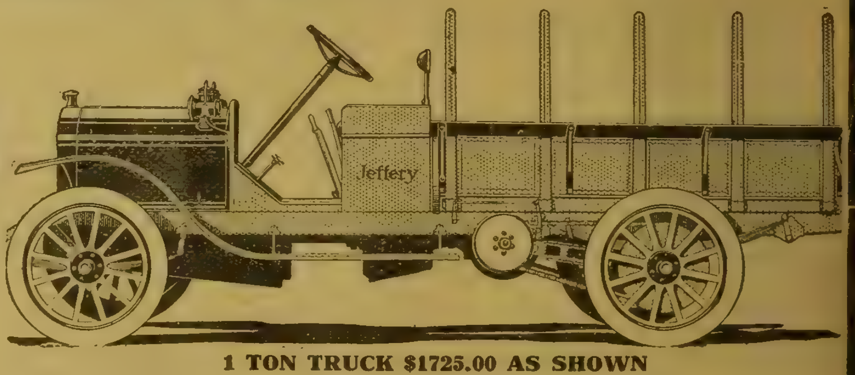
The 1 1-2 Ton Chassis Only $1800



3-4 TON DELIVERY $1475 AS SHOWN

This type of motor wagon is best adapted for delivering articles light in weight and where many trips are to be made each day. It is better to make several complete trips with a light truck of this kind than to hold up packages for delivery with larger cars when most of the time the big truck equipment is running with too light a load, making for lower efficiency and poor service to customers. The grocer who has 3 or 4 horse-drawn wagons, can replace these with a Jeffery ¾ Ton Truck. It will carry the same total load, give more mileage and quicker service.

The Chesterfield Light Six $1775.00



1 TON TRUCK $1725.00 AS SHOWN

The Jeffery 1 and 1½ Ton Trucks are logical in size, capacity and speed to meet the requirements of about forty different lines of business. These lines include those in which the delivery problem is one of medium loads and short or long hauls. They are particularly well adapted for the delivery of varying loads where the truck starts with a maximum load, and the load is reduced or increased as subsequent stops are made. One of the most popular body types for this truck is the platform or stake platform, with or without chains or side boards. Loading space of 10x5 feet 6 inches can be provided, making this truck very practical for brewers, furniture houses, manufacturers and others handling heavier loads. Stakes can be furnished in several lengths, and if desired, a detachable standing top with side curtains can be provided.

Some territory open for reliable sub-dealers. Write for proposition.

Sheep on the Small Ranch

Both Mutton and Wool Breeds Afford Opportunity of Disposal of Many Wastes on Small Farms. Method of Handling and Best Feeds.

Written for Cultivator Readers by Dr. Leroy Anderson

During my childhood and youth on a western New York farm I recall only occasionally a year when there was not a small band of sheep kept. The flock usually consisted of from 25 to 30 ewes as a permanent breeding basis. The farm consisted of 110 acres divided into 10 and 12-acre fields, including 12 acres of apples and a 15-acre wood lot. The sheep pastured in the lane, the orchard, the cleared places in the "woods" and in regular pasture fields. In the winter they had a warm shelter and fed on clover hay, oat straw and grain toward spring when lambing time began. They helped in keeping the farm free from weeds. They furnished the family with a goodly portion of the summer's fresh meat and I still remember that home-dressed mutton as the best I ever ate. They helped to keep up the fertility of the soil. They surely were profitable or my father would not have kept them.

In Yolo County

A few miles northwest of Woodland are two brothers on a 40-acre alfalfa ranch, who are believers in sheep. When I called on them in May they had 19 breeding ewes, which was the increase from a beginning of four or five ewes a few years ago. A pure-bred ram had never been used, but the general type was Shropshire. The average annual increase in lambs has been 100 per cent, enough twins being born to make good any losses. The male lambs are sold to the butcher and likewise ewes except such as are needed to continue the breeding number. The price for lambs in 1913 was $3.25 a head. No sales had been made for 1914, but the prospect looked better, for a neighbor with a large flock had contracted his for $4.10. The spring clip of wool was four pounds each and sold at 15 cents. The total annual clip is usually about seven pounds per head and the wool pays all the expenses of the flock. The receipts from sale of lambs is, therefore, counted clear profit. When asked what was fed the sheep one brother replied, "Whatever the other stock wont eat." On the day of my visit the sheep were cleaning up the growth of grass and weeds in the back yard between the house and barn. They kept the irrigation ditches clean from weeds and were turned in any field that happened to need trimming.

There is nothing big nor spectacular about this small flock of sheep. Neither is there anything spectacular about the great number of small ranches in California. But is not such a band of sheep worth while keeping on many a ranch? Here is a profit of seventy dollars a year on an investment of an equal amount or at the most not exceeding one hundred dollars. Feed that might otherwise be wasted is turned into meat and wool, the ranch is left free of foul weeds and the fertility is increased. More money would be made if better sheep were kept than these brothers have. The demand for registered stock is sufficient to warrant many a man to purchase a few head and enter the lists as a regular stock breeder when the profit (and the pleasure) will be much greater.

Care of the Flock.

If one begins with grade ewes, the larger type of Merino is as good as any, and can easily be selected from the large bands in the state. The Merinos are good milkers and good mothers, and when crossed with a ram of the mutton type produce an excellent lamb. Probably a Shropshire ram would be best to use as this breed is large and considered among the first for mutton. If one were beginning with registered stock he would make no mistake in selecting the same breed. I mention mutton breeds because of the scarcity and high prices of meat.

Sheep require little care as compared with dairy cattle or swine, and are little subject to disease. In the winter they need shelter from the rains and in the summer shade from the hot sun. The ewes should be bred so as to drop lambs as early in the winter as possible, as this enables the lambs to be placed on the market sooner in the spring or summer with a correspondingly better price. The period of gestation in ewes is about 150 days. For January lambs, therefore, the ram should be turned with the flock in August.

(Continued on Page 182.)

Culture and Handling of Shipping Plums

Address by H. C. Blake Before Fruit Growers Convention at Davis

This paper covers conditions obtaining only in California. I will not discuss the origin of the plum, as it makes but little difference to the practical commercial grower whether it was introduced here from Asia or Europe or some other place; suffice it to say that nearly all edible plums are found in the north temperate zone. Species of wild plums are to be found in most of the countries of the north and the south temperate zones.

In this paper I will not consider the prune, or especially the commonly called French prune, as it was very ably treated by Mr. Richmond at the Fresno convention in December, 1913, and his paper has been very generally copied and reprinted all over the coast.

Plums furnish us more different varieties than any other cultivated fruit, and also a greater range of flavor, texture, color, size and form. Because of the plum's great variability and the adaptation of the different varieties to different climatic and soil conditions, it is the favorite fruit for amateur propagators in developing new varieties, and the varieties are now almost without number.

For one contemplating going into the shipping plum business geographic location would probably be the first important consideration; next the selection of the proper soil, and third the selection of varieties, this last consideration to be somewhat influenced by the markets one intends to patronize.

At the present time there are but three or four localities in California that are very extensively engaged in the shipping plum business. They are located as follows: The Sacramento river district, comprising that portion of the river territory located between Sacramento on the north and Rio Vista on the south, and including the section around Lodi; the Vacaville district, comprising what is known as the English Hills and Lagoon valley and the Vaca valley proper; and the Hill section, comprising the Newcastle and Placerville districts.

These three localities are very extensive and successful plum growing districts, but the conditions obtaining in each are entirely different from those in the others. If you should locate on the river you would find a deep, rich, sandy sediment, loamy soil, with plenty of water for irrigation. Should you locate in the Vacaville section, good judgement must be exercised in the selection of a place. Secure a deep, rich loamy soil, though if very well drained and other conditions are attractive a heavier soil may sometimes be selected, but must be treated accordingly. Should you go to the Newcastle district you will find a decomposed granite soil entirely different from either of the other localities mentioned and requiring different treatment.

In the past the Tragedy has been the favorite plum on the river, but many other varieties succeed well. In the Vacaville district it seems that almost every variety known to mankind is being tried out to the limit. Of the 150 different varieties of plums shipped last season by the California Fruit Distributors, Vacaville seems to have been represented in almost every one. The Newcastle district runs strongly to Burbanks, but follows very closely with any newborn favorite reported from Vacaville. Placerville confines her shipments almost exclusively to the Hungarian.

When the selection of location, soil and variety has been made, the next important problem is the root stock, and a big problem it is, and one on which I hesitate to offer advice except in a general way.

The first choice for a root stock for all locations and conditions is the Myrobalan, followed very closely by the peach, but the peach requires a very well drained soil. A most excellent stock, though little used on this coast, is the Marianna, a hybrid originating some years ago in Texas. It grows very readily from cuttings, but does not sprout or "sucker," as it is commonly called.

Great care must be exercised in the selection of root stock, as some varieties refuse to make satisfactory union on certain roots, and other varieties refuse to produce a crop, while still others do not produce satisfactory quality.

In growing your nursery stock the usual nursery practice is followed. The seedlings are budded or grafted the first season, and generally remain in the nursery until the buds or grafts are one year old and have attained a height of from four to six feet.

Before the trees are planted in orchard form the land should be well prepared by plowing about eight inches deep with a good turning plow, and this plow should be followed in each furrow by a good subsoil plow running to a depth of from 16 to 20 inches. The subsoiling is sometimes substituted by the use of dynamite, but this must be done

(Continued on Page 174.)

The Small Bore Engine Of Highest Efficiency

Efficiency is what counts. That means light weight, reduced friction, simplicity, and above everything else, low operating cost. In demonstrating its reliability and its power, the **Western Gas Engine** has very forcibly proven that the small bore engine has the greatest efficiency and is the most economical. The World's leading gas engineers, without exception, agree that the **WESTERN** is correctly designed.

Citrus and Tropical Fruits

HUMUS

Written for the California Cultivator
By H. Culbertson, El Cajon.

(We regret that the following article was crowded from the special issue. Mr. Culbertson writes of farming operations from practical experience. He realizes the necessity of humus and gets it regardless of difficulties.)

The condition into which our soil gets is very strikingly illustrated by a test recently made by Dr. Lipman of the university. Two samples of soil were examined for bacteria content. The samples were taken from a grain field, one from a place where the yield of hay was over two tons to the acre, the other less than one-half a ton. The test was made by supplying in the laboratory a fertilizer of dried blood. The sample producing the two-ton yield of hay changed the blood into a form available for plant food quite readily. The one-half ton hay yield soil had no effect on the blood. The first kind of soil appeared to have a fair amount of humus, the other none at all.

This also suggests why the application of commercial fertilizers does little or no good in some instances.

Humus Makes Fertilizers Valuable.

We have been taught, however, that we get more returns from the application of commercial fertilizers if there is a fair amount of vegetable matter in the shape of humus in the soil. The bacteriologists tell us that with plenty of humus there will be a large number of bacteria in the soil, and they readily change the elements in the soil into condition for the plants to use. If humus is lacking, the number of bacteria is small and the elements in the soil are very slowly changed into a form that the plants can use, hence a very slow growth and small yield.

Stable Manure Best

It is very evident to anyone that we must have a supply of humus. From what source is the question, and this differs in different localities. Where stable manure can be had at reasonable rates it is doubtful if anything can take its place. It has been our idea for some time that a light application every year is better than a heavy application one year and then a number of years without. It produces a more uniform condition in which our friends, the bacteria, may work, and prepare a uniform amount of plant food in available form. Do not understand that we would not put on heavy application if there was a specially good opportunity. Experience teaches that it will remain effective a long time.

The writer has experience in two places on land that he has had in crops that were corrals 35 years ago and without any further application of fertilizer of any kind they are still very much more productive than the adjacent soil. Our experience has been that the application of barnyard manure remains effective longer here than in climates of summer rainfall.

Leguminous Cover Crops

No one questions the value of clovers, peas and vetches, where a good growth can be obtained. This largely depends on the amount of the water supply or the early rains to push the growth. On citrus orchards it should be plowed under the last half of February. On deciduous orchards it may go later.

In most places in Southern California if the plowing has to be preceded by a good irrigation to put the ground in condition to plow, the economic value of the crop is largely consumed in extra labor and costly water. In winters of good rainfall or cheap water the leguminous crops are of especial value. Yet it is doubtful if they are entirely sufficient except where they can be allowed to come up near mature growth. There is need of light applications of stable manure to give a sufficient supply of humus. This causes a much better growth of the vetches. On many orchards the supply of vegetable matter is so low that an application of stable manure is necessary to get a satisfactory cover crop to grow.

Sawdust

The writer has been asked about sawdust and planing mill shavings. We have applied them, both after being used as bedding and in fresh condition, with good results. The one thing to be made sure of is the thorough mixing with the soil. Several harrowings or cultivations before plowing under will mix the application with the soil so there will not be lumps of unbroken material.

Thorough Mixing Essential

This thorough mixing with the soil will be found very important. Any application to the soil that remains the first year largely in lumps will be of doubtful value. The nearer every separate particle of applied vegetable matter can be fully surrounded by soil the more effective it will be. Much of the value of vegetable matter of any kind is in the mellowing or mechanical effect on the soil. Unless the soil can be brought into close contact by thorough mixing, the good results are deferred.

Plowing of any application without thorough mixing is fatal to best results for another reason, that is, the application falls on the bottom of the furrow and very effectually prevents the turned over soil getting moisture from below. It gets very dry and the crop gets little from it. That being the part of the soil where a large part of the available plant food is found it is important to have it in condition to secure moisture supply from below. Very thorough mixing before plowing helps very much.

Handling Straw Mulch

For supply of vegetable matter to the soil, straw is an excellent application. If properly mixed the mechanical effect is excellent and lasts a long time in holding the soil in a mellow condition with reasonable cultivation.

Getting it into the soil well mixed is not so difficult as one would think before trying. Put the straw on the ground about six inches deep, about September, after a good irrigation and cultivation. At this season we have occasional desert air spells of two or three days when the straw gets very dry and brittle. Then in the afternoon of such days go onto the straw with team and harrow. Usually the teamster gets disgusted at first because it seems he is not doing any good. But never mind, keep going. Sometimes the harrow will be nearly

212 W. Julian San Jose, Cal.

two feet from the ground with the straw under it, but never mind that, keep the team going and the straw finally becomes well broken up and mixed with the soil, hindering the cultivator but little after the first time.

Emphasize the point of doing the work during the desert air spells when the straw is very brittle. It would be a serious undertaking any other time.

Seeds a Winter Crop

Generally a straw covering of this kind will give a very good seeding of grain which produces a heavy tonnage of green cover crop to plow under in February. The plowing under of this growth should be immediately followed by the disk cultivator, setting the disks straight. Go over it several times, the object being to get the soil well packed on cover crop to cause it to decay rapidly. If the disk is not used the upper soil dries out completely to the bottom of the furrow. The cover crop does not decay readily, and a number of difficulties become manifest.

Barley When Water is Short

Where the water supply is short the sowing of barley for a cover crop is probably as good as anything. In this method the extra nitrogen required will have to come in an application of nitrate of soda or lime, this kind of a cover crop being used exclusively for the humus supply to the soil.

A gardener in this locality is keeping ten cows for the purpose of enriching his ground. He buys nearly all his feed and sells the milk. The milk makes a small profit and all the droppings go on the ground to make a larger profit in the vegetables. One of the visible results is a good automobile recently purchased.

NEW CITRUS DISEASE IN FLORIDA

Readers of the Florida Grower will remember that some months ago we mentioned the fact that a new citrus disease had appeared in Florida, and that it had gained considerable headway before coming to the attention of the state inspector. When the seriousness of the case was recognized, Dr. Berger was sent to Texas to look into the matter, as it was fairly certain that the disease had been brought into Florida from that point, probably coming from Japan in the first place.

While Dr. Berger and those familiar with the case know that something must certainly be done to stop the spread of this tree pestilence, there was no money available that the state inspector of nursery stock could get from the state fund, for his office is allowed but a miserable $3,000 a year for salaries and expenses. It was here that the value of the Florida Growers and Shippers League as an organization was shown. Where they got the money we do not know, but it is sufficient to say that Dr. Berger was notified that the league would advance the state the money with which to make an immediate fight, trusting that it would be returned in time. This is a parallel case with that of the white-fly fight in California, the office of the agricultural commissioner having no funds for the purpose, but the California Protective League loaning $50,000, which was afterwards returned by the state.

The assistant chosen by Dr. Berger is Frank Stirling, of DeLand, and he has just written the state nursery inspector's office as follows:

"I have carefully examined some 50,000 nursery stock and several groves. Up to the present time I have found the canker in three different places outside of the two we already knew about. On one of the originally infected places the owner has destroyed every infected plant in his nursery, and has cut back the balance, even though not yet showing signs of infection. In another place I found 15,000 pomelo buds and seedlings all affected. This man has already cut back, according to his estimate, over $8,000 worth of stock, and is painting stubs with lime and bluestone mixture. In another nursery I found 20,000 trees all affected. They will be treated. On one ten acre grove I found all trees affected, and they have been cut back and painted —750 trees in all.

"The people here are taking this matter better than I expected they would, and all are united in trying to eradicate the infection, realizing that unless they do their business will be ruined utterly."

Our representative has just returned from the infected district, and the following has been written by him on the subject:

Citrus Canker Investigations

"Get busy and eradicate the new disease," seems to be the slogan of the growers in the Redland district of Dade County, where Frank Stirling is working under the directions of Chief Inspector of Nursery Stock E. W. Berger. That is the slogan of 98 per cent of the growers seen in a four-day canvass of the infected territory, the other two per cent will tell you they are for the elimination of the canker, too, but differ with the majority in this way.

One says citrus canker is prevalent throughout Florida, that he has seen it in Orange County for years, that the present dry weather causes it to spread more rapidly and do more damage, that the citrus canker, or Texas canker, as they call it locally, is nothing else but the lemon scab, and then he hints at jealousies on the part of growers elsewhere because of the rapid development going on in Dade County. The fact is, however, at the time the writer interviewed him he had never seen any citrus canker, neither had he read bulletin No. 122, so was only expressing his own personal views. He had a right to do this, whether he was right or wrong, and was exercising that right, so he claimed.

The other case was where a grower expressed himself as being afraid that the investigations carried on by the state would lead to more laws, laws that would interfere with the property rights of the growers. He claimed the right to take care of his grove as he thought best without any interference by the state or any one else. Unlike most people who argue that way his grove and home grounds showed good care. When questioned about his views on the absent grove owner, who neglects his grove to the detriment of all groves in a community, he suggested taking their property away from them, but had no mode of procedure. He was against any laws or compulsion in enforcing care for groves, as he was afraid of grafters securing control of the work.

The entire Redlands district is excited about the citrus canker investigations. Wild rumors are circulated about the ravages of the disease. In one store there was a discussion about a 60-acre bearing grove being condemned by the inspector and or-

CITRUS TREES

Buy from the largest Citrus Nurseries in the World

—and know what you are planting. Teague trees are better than others because scientifically grown. They are started right, grown right and shipped right. Ask for quotations.

We can supply all the STANDARD SORTS in almost any quantity—

ORANGES :: LEMONS
POMELOS

Teague trees are well rooted, strong and thrifty, free from scale, guaranteed true to name.

OUR BOOK "CITRUS FRUITS" — handsomely illustrated; a wealthy fund of accurate data —sent for 25c in stamps.

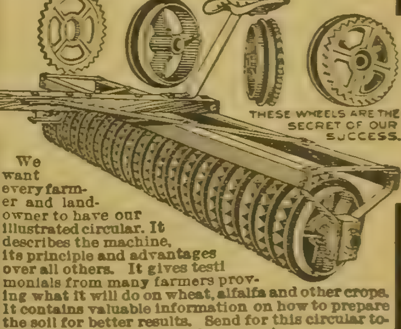
3 MACHINES IN 1

A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes. 1 and 3 sections. **Sold direct to you on one year's trial. Prices, $22.00 and up.**



THESE WHEELS ARE THE SECRET OF OUR SUCCESS.

We want every farmer and landowner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.

Valentine Peyton, Lordsburg.
T. E. Yerxa, Highlands.
and many other users all over California.

The Hislop Automatic Lighting Device for All Makes of Orchard Heaters

Here's what you have been looking for, Mr. Orchardist. A simple little lighting device, easily applied to any and all makes of orchard heaters. So simple that any child can operate it—simply by pulling a wire. This one operation at once sets off a flame of intense heat, and surely, quickly and effectually ignites heat, and surely, heaters in an instant. It is just what you need to complete your plans for frost protection and to save a vast amount of labor. It is also so cheap as to be absolutely practical—therefore, also indispensable. Does not require electrical apparatus of any kind whatever. We will be glad to demonstrate this Lighter to you at any time. Address

Hislop Orchard Heater Co., Upland, Cal

Full information upon request.

References—First National Bank, Upland, Ontario, Pasadena, or to anyone who has purchased our heater, as we have not a single dissatisfied buyer.

dered pulled up by the roots and destroyed. There is no such size grove in that neighborhood and the inspector had ordered no property destroyed.

Few of the growers understand how the present work for the elimination of the citrus canker was being carried on; some gave credit to private individuals; some the state, while others thought it was the United States government. Some of the better posted ones who know the Florida Growers' and Shippers' League is paying the bill and Chief State Nursery Inspector E. W. Berger is directing the work, are loud in their praise of the league.

One grower stated he never imagined there was such a wide field for the Growers' and Shippers' League when he joined and he certainly was getting his money's worth now.

Frank Stirling, who is the deputy inspector in charge of the investigations in the Redlands district, stated, so far, all cases of citrus canker he had discovered, some 10 in number, could be traced through the moving of nursery stock, or the carrying of the disease on the nursery workers' tools. He expressed himself as very well pleased with the cooperation and assistance rendered him by every one he had come in contact with in his work.—Florida Grower.

Deciduous Fruit Culture

CULTURE AND HANDLING OF SHIPPING PLUMS

(Continued from Page 171.)

when the ground is absolutely dry. Thorough cultivation must be practiced during the life of the tree.

For planting the ground should be marked off to require from about 90 to 100 trees per acre, the lesser number being preferable. This is usually done with a wire about 200 feet long having a button of solder at every place where a tree stake should be located.

Holes should be dug of ample size to allow plenty of room for the placing of the roots without crowding, and the soil well settled around each tree either by tamping with the feet or by the use of water. The tree should be topped at once to a height of about 16 inches.

It seems almost superfluous to urge the use of very great care in every act, but it is absolutely necessary to success. In many localities it is necessary to protect the bodies of the young trees from the hot rays of the sun during the first season. This is best done by the use of shakes or some of the excellent manufactured tree protectors to be found on the market.

During the winter after the trees have been planted one year they should again be pruned back about one-half or two-thirds of the season's growth, leaving about three or four limbs in such a position as to form a good strong head on which to build your future tree. Until the tree comes into bearing the pruning must be done with the main idea of forming as strong and well shaped a tree as possible, and care must be exercised to keep from leaving the growth too thick or leaving too much wood in the tree.

After the tree has come into bearing and the crop is set the most important step is thinning. Without proper thinning you cannot hope to stand the strong competition of the present day. With some of the new and improved varieties it is necessary to thin two or three times.

Unless the laborer doing the thinning is an old hand at the business, it is hardly safe to let him look at the ground under the trees after thinning or he will never get enough off. Like everything else, thinning requires good judgment and experience.

As the culls from shipping are usually a dead loss, the pruning and thinning should be done in such a manner as to reduce the per cent of culls to a minimum.

As to the state of maturity for picking for eastern or European shipment, no ironclad rules can be laid down. It is another case where the exercise of good judgment and experience is necessary, as what is proper in one locality would mean failure in another. Great care must be exercised not to disturb the bloom on the fruit in handling. Great variety of opinion exists as to the proper ripeness at which to pick the different varieties, also the same variety in different localities.

The usual practice by the inexperienced is to pick too ripe, and by those after the early markets, to pick too green. The matter of picking must be settled by experience with each variety in each locality. Take for instance, the Kelsey plum. It will not color on the tree in the Vacaville district until too ripe for shipment, but will color well en route if picked hard. On the other hand the same variety in the Lodi section will show a handsome color and still be firm. The Climax, when picked straw color or with slight pink at the apex, will ripen and color to perfection en route. The Tragedy may be picked as soon as color begins to show, or may be left on the tree until almost fully colored and still go the long route and arrive in perfect condition. With the long list of varieties now grown in this state it would be useless to even attempt to try to describe each.

Plums are usually packed in five-pound baskets, four baskets to a crate. The smaller varieties are usually packed in three layers 4x5 or 5x5, and in some instances with the very early ones as small as 5x6. The larger varieties are usually packed 4x5 and 4x4, and in some cases 3x4. In the extremely large sizes they are frequently wrapped in individual papers instead of being placed in layers between long strips of paper, as is the case with the smaller sizes.

The packing should be done in such manner that every plum is keyed secure in place, but not bruised, and nothing but perfect fruit packed.

The cover must not press fruit sufficiently to bruise same, but must bear firm enough to hold fruit from being displaced by rough bumps by the train en route.

For lack of time I am compelled to omit such important features as fertilization, spraying and insect pests, and will give some time that might have been devoted to those subjects to the subject of varieties, which is one of the most important features of the plum business at the present time.

The man in business tries to follow the lines of least competition. So with the plum grower. During the last few years so much advance has been made in the creation of new and improved varieties that it has stimulated the grower's desire to get his plums in the market when it is as bare of fruits as possible. Under existing conditions this is secured by being the first on the market. Many standard varieties now considered comparatively old will always command a place in any market, such as Tragedy, Burbank, Wickson, Climax, Hungarian, Grand Duke, Giant and Diamond. But many new and valuable varieties are now competing for first place on the list of good shippers. Prominent among these are the Beauty, Formosa, California Blue or Vacaville, the Gaviota and many others, some yet unnamed, which I am not at liberty to discuss. One very promising new variety originated by my neighbor, Mr. Burton, which he has called the Earlianna, was entirely harvested by the first of June. It is a good-sized plum of splendid color and shape and an excellent plum for the table, a good bearer and the best all round early blue plum. In conversation with a neighbor recently who is growing over 100 different varieties, he remarked that he would confine his energies to but few, such as Beauty, Formosa and perhaps one or two others, and after inspecting his orchard his judgment seemed to me to be wise.

From our experience in the past we feel that the possibilities for improved varieties are almost unlimited. As we are now growing many times as many varieties as are needed, and so many as to keep the buyers at sea as to what is being offered them, I think it wise to eliminate all of the second and third rate varieties, except where absolutely necessary to retain them for pollenizing better ones. On account of the great variation in the time of blossoming in different seasons, varieties requiring special pollenization are rather unsatisfactory.

A very unsatisfactory condition obtains on this coast in the naming of fruits. It is bad enough to have to be confused with a thousand or more distinct varieties, but when we add to this trouble by insisting on calling some well defined variety by some four or five different names, we are surely in need of a guardian. If this matter could be handled through the American Pomological Society, or some state society in connection with the national society, it seems to me it would simplify one of our most perplexing difficulties.

And now in conclusion my advice to those contemplating the shipping plum business is to go slow and to investigate thoroughly first and be satisfied with nothing but the best conditions, then with care and good judgment you are sure of a success that will net you a handsome income. You now have the United States and Canada for market, as no other portion of America grows successfully the fine varieties produced on the Pacific coast. And as soon as the Panama Canal is opened you may annex the markets of Europe with an excellent refrigerator steamer service direct from your own great city of San Francisco.

Music is a kind of inarticulate unfathomable speech, which leads us to the edge of the infinite and lets us for a moment gaze into that—Carlyle.

CALIFORNIA APPLE SHOW

The California apple show, which will this year be held in the city of San Francisco, will be very much like its predecessors along many lines, but in one particular there is to be a new feature. Mr. Perkins, the manager, wants every housekeeper in California to tell what can be made from an apple. He grants that California apples will make good cider and some other things, but what are these other things?

He wants recipes for pies made from green apples and dried apples; recipes for apple whip, for cobblers, jellies, jams, preserves, salads—anything and everything that is made of apples and is good to eat. As everybody knows apple pies are not all alike, and if the California apple show can put into the hands of the wives of California a recipe for the very best apple pie that can be made, the result is going to be an increase in the demand for apples. That's the Perkins idea.

President O. D. Stoesser of the Watsonville Apple Annual Association is going to appoint a committee to award prizes to the authors of the best recipes. An effort will be made to persuade some of the famous chefs of San Francisco to serve on this committee and to experiment with the recipes in their perfectly equipped kitchens. The prize winning recipes will be published in the handsome apple show program, which is to be made in the shape of a huge bellflower apple and printed in the natural colors.

FIRST PRINCIPLES OF SOIL FERTILITY

First Principles of Soil Fertility, by Alfred Vivian, professor of agricultural chemistry, Ohio state university, published by the Orange Judd Company, New York, at $1.00 net. The Cultivator will be glad to secure the book for its subscribers at the above price or, including a year's subscription to the Cultivator, at $1.85.

No demand for information in agricultural matters is more insistent than that for the very latest and best regarding soils and their improvement. Perhaps no question has been studied more than this one and perhaps none is farther from solution. If all farming lands were of the same texture, with the same sub-soil, the same moisture conditions and the same chemical content, our fertilizer questions would be very simple, but as that will never be, the only solution for soil fertility problems is study. The best book of all is that of nature and of experience with the individual soils the farmer has to deal with, but there is today more interest in good books touching upon physical and chemical conditions of soils than ever before. An excellent aid to this study is First Principles of Soil Fertility. It is true to name. It deals with much that is elementary but in such an attractive way that all will find its reading most interesting.

The book is divided into 22 chapters. Its trend may best be given by a few of the headings: Atmosphere as a Source of Plant Food, Soil as a Source of Plant Food, Soil, Origin, Tillage, Drainage, Fallowing, Humus and Green Manuring, Crop Rotation, Value of Manures and Chemical Fertilizers. Mixed and simples are both discussed. There are tables giving fertalizing constituents, and an excellent index completes the book. Every student of soils will find it most interesting.

CALIFORNIA FRUITS

California Fruits and How to Grow Them, by E. J. Wickson, A. M., published by the Pacific Rural Press, San Francisco, $3.00 net. The Cultivator will be glad to secure the book for its subscribers at the above price.

The first edition of this book, dedicated to Professor Wickson's associates of the state horticultural society, came from the press a quarter of a century ago. We still have a copy of this first edition in the Cultivator library. It is almost as large a book as the latest or seventh edition or the nineteenth thousand, which is demanded by the ever increasing hosts of fruit growers of the Pacific Coast. Of course, this latest edition follows the same general line as the first yet the many changes in text and illustration make it practically a new book. It is divided into ten parts, with one to a dozen chapters in each part. Part one is general, touching upon climate, soils, native or wild fruits, introduction of Mission fruits and new fruit varieties. Part two is all cultural and ranges through clearing of the land, planting of nurseries, budding, grafting, soil preparation, pruning, cultivation, fertilization and irrigation. Part three takes up deciduous orchard fruits grown on the Coast. To name the headings of each chapter would be to give practically an entire list of fruits grown in this state. Part four is on the grape. It treats on varieties, propagation, planting, pruning and general care. Part five has to do with citrus fruits and other semi-tropicals. Part six is given entirely to small fruits. Seven to nuts. Eight to fruit canning, crystallizing and preserving. Nine to fruit protection from insects, diseases, animals, frosts and wind. Ten is miscellaneous, a discussion of utilization of fruit wastes and last, and most valuable of all, is an excellent topical index.

Prof. Wickson's life has been almost entirely in California. He is too well known and his ability as a writer so well recognized that commendation of this book is unnecessary, but we believe every orchardist should have a copy, and even if he has one of the former editions there is so much that is new in the book that it should be added to every library.

THE ARROYO GRANDE FARMERS' UNION

The Arroyo Grande Local No. 145, Farmers' Educational and Cooperative Union of America, which was organized last January, now has some 60 members and is in good working condition. Already it is discussing the cannery proposition and it is thought there are fair prospects of putting it through. It has been decided to incorporate the union so that business may be done in a more regular way and the products of the members may be handled with more profit. The union will also purchase supplies, one of the purchases already made being two cars of wheat which has been distributed among members.

On August 12 the union held its first annual picnic at the beautiful camp grounds on the hills above town. Almost all the members and many friends were there. A good program of music and addresses and, of course, the usual basket luncheon, were features. Secretary Millard of the state union was the principal speaker.

Try to live up to your epitaph.

SECOND HAND PIPE AND CASING

All our pipe and casing has newly cut threads with new couplings attached and dipped in asphaltum. Guaranteed good as new. Prompt delivery on carloads or less. Small orders receive same attention as large ones. All sizes of pipe, also fittings and valves.

Small Fruits and Vegetables

CABBAGE WORMS AND CABBAGE APHIS

By M. A. Yothers, Assistant Entomologist, Washington State Experiment Station.

Cabbage worms and cabbage aphis, or lice, are found in more or less destructive numbers wherever cabbage and other cruciferous crops, such as turnips, rutabagas, cauliflower, etc., are grown. Some seasons they are much more destructive to these crops than others, owing to various causes, such as the weather conditions or the presence or absence of the various parasites and predaceous enemies, which sometimes keep them reduced to a minimum.

The green caterpillars, or cabbage worms, found on cabbage and allied plants are too well known to need any description. They develop into the common white, gray or orange butterflies with small dark spots on their wings. They are seen frequently during the summer flying about the garden and clover and alfalfa fields. The butterflies lay the eggs on the cabbage, which hatch into the caterpillars.

The state experiment station at Pullman advises that the best method of controlling these worms is to spray the plants before they are half grown with arsenate of lead and soap, prepared as follows: arsenate of lead (paste), three ounces; soap, one-half bar; water, four gallons. This spray should be applied whenever the worms become abundant enough to justify it. Usually an application about the first of July and another two or three weeks later will be sufficient for early cabbage. Late cabbage may require an additional application later.

Another thing about answering advertising in this paper; it is always well to mention that you saw the advertisement in these columns. This is a sort of introduction for you—a letter of introduction from us to the advertiser.

The cabbage aphis are also very well known to every gardener. They live over winter in the egg stage or as mature aphids on the old plants left in the garden during the winter. A great many generations are produced during the summer and fall, so that by late summer those plants only slightly infested in the spring may be seriously injured by these pests unless destroyed by their parasites or predaceous enemies. They are often kept in control by the ladybird beetles and the larva of the Syrphus flies.

The best method for controlling the plant lice is to spray the plants with tobacco and soap mixture prepared as follows: Blackleaf-40, two tablespoons; soap, one-half bar; water, four gallons. The soap is necessary in order to make the spray spread evenly and penetrate the mealy covering of the lice.

In as much as both worms and aphis are nearly always present at the same time, it is often desirable to spray for both, and this can be done with a combined spray prepared as follows: Blackleaf-40, two tablespoons; soap, one-half bar; arsenate of lead, four ounces; water, four gallons..

SWEET POTATO DISEASES.

The plant pathologists of the department of agriculture estimate that the yield of sweet potatoes is reduced approximately $10,000,000 annually by the ravages of several diseases, notably the black-rot, stem-rot and foot-rot, all of which may be prevented by the use of proper precautionary measures. In spite of this large loss of money, the crop of 1913 will probably amount to nearly 65,000,000 bushels with a value of $40,000,000. Two of these diseases, the black-rot and stem-rot, are well known to most farmers who grow sweet potatoes.

Black-Rot.

This disease is nearly as widely distributed as the crop itself. It affects the plant from a little above the soil down into the crown, causing a black, rotted appearance of the affected part of the stem. In the winter it is common in many storage houses and is readily recognized by the black, circular, somewhat sunken spots, which render the potatoes unsalable.

Stem-Rot.

Although not quite so widely distributed, stem-rot is equally as destructive. It is caused by an organism which enters the vines, stems and roots of the plant and fills the water-carrying vessels. It enters the potato at the stem end, where it appears as a blackened ring just beneath the skin. In fields where this disease occurs, plants can be seen throughout the summer wilting, turning yellow, and gradually dying.

Foot-Rot.

Another disease, less widely distributed but bad in the localities where found, kills many plants in the fields by destroying the bark on the stem a few inches above the hill.

These diseases are found both in the hotbed and in the field and may be carried through the winter on the seed potatoes and in the soil. Infection may therefore result from the use of diseased potatoes for seed or from the use of infected soil in the hotbed or field where the slips are grown and transplanted. With these facts in mind it is clear that a clean crop could be grown if disease-free seed is used and bedded in disease-free soil and the slips coming therefrom planted on ground where the disease is not present. These three requirements can be fulfilled by selection of seed, by disinfection of soil in the hotbed, and by crop rotation.

Seed potatoes for the new crop should be selected preferably in the fall at digging time and carefully examined again in the spring when starting the hotbed and all discarded that show any symptoms of disease. Before any seed potatoes are selected from a hill, the stem just above the potatoes should be split open to see that it is not blackened inside. No potato should be taken for seed from a hill which has the stem blackened inside. The seed potatoes should be stored in crates or baskets and kept separate from the general stock. Seed potatoes should be disinfected with a corrosive sublimate solution, one part of corrosive sublimate to 1000 parts of water, for about five to twenty minutes. They should then be rinsed in water and thoroughly dried. It is preferable to disinfect in the fall on a warm, clear day.

With clean seed potatoes it is essential that the hotbed be free from parasitic organisms. Great care should therefore be exercised in its preparation. Before the soil is put into the bed, the cement, boards, or whatever is used in the construction should be thoroughly sprayed with a solution of five pounds of copper sulphate to 50 gallons of water and then with Bordeaux mixture or whitewash. In some localities where these diseases are very prevalent it is almost impossible to find soil that is not infected. Fields which had not been grown to sweet potatoes for nearly 40 years have given an infected crop when clean slips were used. Where such a general infection has occurred, the soil is light and it is probable that the organisms were disturbed by the wind. In view of these facts it is advisable to disinfect all hotbed soil. This can be done by treating it with a solution of formaldehyde, one pint of formaldehyde (40 per cent) to 24 gallons of water. This chemical is cheap and can be purchased at almost any drug store. When the soil is to be thus treated it should be placed in a tight box or other receptacle and enough of the solution added to soak it thoroughly. The application should be made at least two weeks before the soil is to be used, in order to allow the formaldehyde to evaporate. An occasional stirring of the soil will assist in the escape of the gas. Disinfected soil should be carefully protected to prevent infection before it is used. All instruments used in handling sterilized soil, such as the wagon box, shovel, etc., should be disinfected.

It is believed by some farmers that better and stronger plants can be secured by using manure as a source of heat in the hotbed. Others insist that equally good, if not better, plants can be grown in a fire bed. From the standpoint of disease there is far greater danger in the use of manure, especially if it is produced on farms where sweet potatoes are grown. It frequently happens that farmers are careless about the disposition of decayed sweet potatoes and feed them to hogs or chickens or, more often, throw them on the manure pile. From there they are carried to the hotbed and infection of the young plants becomes easy. It is urged that all refuse sweet potatoes be cooked or burned and not thrown where they will be scattered in the manure and hauled on the farm or used in the hotbed.

It is not known how long these diseases will remain in the soil without the sweet potato as a host. It is advisable, however, to follow a system of crop rotation that will not bring this crop on the same ground oftener than once in three or four years. It is certain that the crop will not be free from disease so long as the organisms are present in the fields. The only way to get them out of the field is to starve them out by planting crops on which they can not live. Experiments, however, have shown that the percentage of diseased plants is much reduced by planting healthy slips, although the soil may be infected. This fact alone justifies all the precautions necessary to grow healthy slips, even though the soil on which they are planted is diseased.

The Ornamental Garden

RURAL SCHOOLGROUNDS

Written for the California Cultivator

By E. Braunton.

Civic interest and civic effort should everywhere center upon the local schoolgrounds, but nowhere is special attention so necessary as in strictly rural communities, especially where the school yard is some distance from the nearest home.

Where there are several close neighbors these may be depended upon to cement and foster improvement and embellishment sentiment through selfish interests or even through a laudable desire for neighborhood improvement, but when a school is somewhat remotely situated, what is everybody's business is nobody's business.

So many times have I written down this central thought and self-evident truth that were the needs not most pressing I should hesitate to again refer to it. But it is indeed strange and a sad commentary on the frailties of the most enlightened, most advanced race on earth that the only piece of property in a community in which all have common ownership and in which all should have equal and unquestioned interest should be the most neglected. Not infrequently rural schoolgrounds are so bare and unattractive as to be a positive reproach to every resident of the district.

When we gravely consider this matter it must occur to some, if not all, that during school years the most impressionable period of a child's life is passed. If this be true, and I believe the statement will not be questioned, should we not seek to imbue the child with a love for the beautiful? The plastic mind of the juvenile is then figuratively potter's clay. Shall we awaken and encourage and cultivate its finer sensibilities in this direction or shall we allow them to become atrophied so that in mature years the beauties of nature do not appeal to these unfortunates whose early education, in the highest sense, we are at present neglecting? To come down to cold facts, are not our lives too sordid in the attitude we bear toward the local schoolgrounds? From an economic viewpoint it pays to bear our just share in the beautification of the school premises. Not all can afford ideal home surroundings because of the attendant expense. But a small portion of the sum necessary to finish and maintain a high standard of gardening at home, if contributed by all, would so embellish and permanently improve the local schoolyard that every resident would have just cause for pride whenever his thoughts or his eyes wandered in that direction. Nay, more; it would make it so attractive, if the sum total was wisely expended, that not only the local community as a whole, but people from far and wide, would visit it again and again because of its wonderful and impressive charms. All this may sound poetic, and some will say the scheme is impractical, but I know of schoolgrounds within a few miles of Los Angeles that are more richly planted, more regally maintained and far more attractive than any private garden within a radius of 10 miles. That's the kind of a community to live in. During the last

(Continued on Page 191.)

Books

This list of helpful, instructive and interesting books is prepared by us with the purpose of enabling the Cultivator readers to supply themselves at the lowest possible cost. The great value of many of these is so well known as to need no comment from us. Some of the new books which we have added to the list this year deserve special mention. "Co-Operation in Agriculture," by G. Harold Powell, should be in the hands of every producer of farm products. "Farm Sewage," by Santee, will aid many in solving a perplexing problem. "Farm Manures," by Thorne, is decidedly valuable. We state sincerely that no orchardist can afford to get along without "The Pruning Book," by Bailey. We have had much inquiry for a book on keeping farm accounts—we can supply a good one now. The imported book, "Insecticides, Fungicides and Weedkillers," by Bourcart, is a marvel of completeness. The rapidly increasing use of gasoline engines, automobiles and tractors by the farmers has demanded reliable treatises on these subjects. "The Gasoline Engine on the Farm," by Putnam, "The Modern Gasoline Automobile," by Page, and "Traction Farming and Traction Engineering" are exceptionally complete, well illustrated and easily understood. Don't overlook the "Cement Workers' Handbook"—it's "worth its weight in gold." Every book on this list has the endorsement of the California Cultivator.

Humus

The use of cover crops as a fertilizer and a means of adding humus to the soil has become established among the most progressive orchardists. The value of legumes in adding available nitrogen to the land is recognized in every line of husbandry, and the fruit grower has found the addition of humus a great saving in irrigation.

Fenugreek

Vetches, Burr Clover, Melilotus Clover are all highly productive of humus and nitrogen in soil. Fenugreek makes an especially dense growth and grows to excellent advantage in heavier and poorer soils.

Nitrogen

Hand in hand with the increasing use of cover crops has come the development of the nitrogen gathering bacteria, which has reached its highest point of commercial success in "Farmogerm," a high bred culture of bacteria, preserved in containers that admit air, yet prevent the admission of destroying germs.

Farmogerm

This product is most easily applied to the seed before planting, the result being an enormous increase in the foliage and nitrogen nodules of the crop. Many planters report an increase of three hundred per cent in tonnage, which is all returned to the soil through the decomposition of the plant. Write Dept. C for special literature and expert advice free.

Jackson Horizontally Split Double Suction Pumps

Are high efficiency pumps designed to operate continuously under various conditions

Jackson Pumps mean quality—quality in materials, workmanship and design. You get quality that makes for lasting service—reliable service.

The Jackson Pump is the most efficient type of pump—because the Jackson Pump is made in special types to meet every service condition — because the Jackson Pump is made extra heavy and will last.

For farm irrigation the Byron Jackson pump is the ideal pump.

Farm Economics

FIVE RULES FOR BORROWING MONEY

Five rules designed to convince farmers that there is no magic about credit are set down in Farmers' Bulletin 593, "How to Use Farm Credit," which the department has just published. Unless the farmer who is thinking of borrowing money fully understands these rules and is willing to be guided by them, the government's advice to him is "Don't." As it is, there are probably almost as many farmers in this country who are suffering from too much as from too little credit.

Of these rules the three most important are:

1. Make sure that the purpose for which the borrowed money is to be used will produce a return greater than needed to pay the debt.

2. The length of time the debt is to run should have a close relation to the productive life of the improvement for which the money is borrowed.

3. Provision should be made in long-time loans for the gradual reduction of the principal.

The first rule is, of course, the key to the wise use of credit. Between borrowing money to spend on one's self and borrowing money to buy equipment of some sort with which to make more money there is all the difference between folly and foresight, extravagance and thrift. If the money is borrowed for a wise purpose it will produce enough to pay back principal and interest and leave a fair margin of profit for the borrower into the bargain. If it is borrowed for a foolish purpose it will produce nothing and consequently there will be nothing with which to repay the loan. From this point of view it matters comparatively little whether the interest be high or low. It is the repayment of the principal that is the chief difficulty.

Keep up with the march of events and the progress of invention by noting the new appliances advertised in this paper from time to time. The advertising columns of the farm paper are a safe register of progress in the world of agriculture.

Rules 2 and 3 deal with the most satisfactory ways of repayment. Underneath them both is the same principle: The loan must be repaid with the money it earns itself. For example, if the money is used to buy a machine that will last 10 years, the machine must earn enough in that time to pay for itself or it never will. The loan, therefore, should be entirely repaid before the 10 years are up or the farmer will lose money on the transaction, paying out interest for no benefit in return. On the other hand, if too early a date is set for repayment, the machine will not have had sufficient opportunity to make the requisite money and the borrower may have difficulty in raising it elsewhere. Rule 3 provides for some form of amortization, the system by which the principal is repaid in installments so that the amount of the loan is continually diminishing and in consequence the interest charges also. Such a system is quite feasible when the loan is really productive, when it returns to the borrower a definite revenue each year. Tables showing the payments required to pay off principal and interest in varying periods of time are appended to the bulletin and are recommended to the serious consideration of everyone who contemplates borrowing money. The bulletin also advises the farmer to secure the lowest possible interest. At first sight this seems too obvious to be worth mentioning. Of course, the interest should be as small as possible. Everybody knows that—except the lender. But if the other rules are observed, if the borrower manages his financial affairs soundly, he will be surprised to find how much easier it is to obtain favorable terms. The right kind of lender does not want to foreclose mortagages; he wants his money back with a fair profit, like any other merchant. For money that is borrowed wisely, for money that is sure to be repaid, he charges low interest.

This, in fact, is why the government has published these rules for borrowers. It is not so much a matter of driving a shrewd bargain as it is of observing a few fundamental principles which alone can make credit a blessing and not a curse.

SAN JOAQUIN IN LINE

One of the counties which has appointed a county farm adviser or, using the appellation recommended by the department of agriculture, a county agricultural agent, is San Joaquin. Mr. Frank F. Lyons has been appointed and a farm bureau organized. At a recent meeting of the bureau it discussed plans of work. There were present Ed Powers of Manteca, president; J. A. Aggeler and R. G. Cople of Roberts island, Edgar Davis of Linden, Harry Bailey of Lodi, J. P. Watkins of Ripon, E. A. Clow of Escalon, Asa Clark of Stockton, Irving Webster, secretary, and Farm Adviser Frank F. Lyons. Mr. Lyons is already engaged in active work in various parts of the county.

TEN FACTORS OF PROFITABLE FARMING

The ten essential factors of profitable farming as recently set forth by Dr. W. J. Spillman, of the federal office of farm management, are:

1. Low real-estate prices for the land cultivated.
2. Production of commodities for which the supply is less than the demand.
3. Management of the business on as large a scale as capital and managerial ability will permit.
4. Production of commodities of the highest quality.
5. A reputation for reliability.
6. Location for good markets available, and ability to buy and sell profitably.
7. Keeping only animals of highest productive capacity.
8. Large yields with relatively little labor and fertilizer.
9. Production at low cost.
10. Production of staple commodities for permanent profits.

Profit in the Poultry Yard

"FIRST AID" TO THE SICK HEN

Written for the California Cultivator by Jean A. Koethen.

The subject of the diseases of fowls is a painful one to me, yet it seems to be just the one that most people want to hear about. There ought not to be any sick fowls. The natural condition of a fowl is health. A sick fowl is an anomaly. She should not exist. She would not exist if man, who has been placed in control of her, used common sense.

I am not a Christian Scientist, but I do believe in fresh air and sunshine and exercise and pure food and a simple, wholesome life for man and beast. But it's no use talking, of course. As long as there are people in the world who insist on wearing pumps and silk stockings in the rain, or eating pie at bedtime, or on shutting up hundreds of human beings at once in a room without a crack open to let in a little of God's pure air, we must expect fowls to be kept in overcrowed, filthy quarters, fed on indigestible food, and deprived of the exercise they want and need.

A wag wrote to the editor of a country paper: "Dear Sir: Every morning when I go out to the hen house I find some of my hens under the roosts, with their toes turned up, stiff as buckram. Kindly tell me what the matter is." The editor replied: "We think your hens must be dead, but there isn't much that can be done. They will probably stay that way quite a while."

The moral of this story is: After asking what killed them. They are your fowls are dead it isn't much use dead. That ends the matter. But how about those that are still alive and healthy? The time to lock the door is before the horse is stolen. Be alive to the condition of your fowls, prevent illness by all possible sanitary and hygienic precautions, but if it does appear be ready to combat it instantly by the use of the simple remedies which are at every one's disposal. Doctoring, as we use the word, is a waste of time in most cases, but it is often possible, by the use of the right treatment at the right time, to head off disease and prevent contagion.

Signs of Disease.

The poultry keeper should train his eye to discern any lapse from health on the part of a single one of his fowls; the dark or pale comb, the lagging step, the ruffled plumage, the "humped up" attitude, the failure to be on hand at meal time, are all indications that something is wrong. Now is the time to find out what is the trouble. Don't wait till they are past help.

Diseases of fowls, like those of human beings, may be classified as acute and chronic. The chronic disease comes on slowly and gradually; the only symptom at first may be the color of the comb or a disposition to stay on the roost. Acute disease comes on more rapidly. Sometimes the only symptom is a dumpiness or drowsiness that increases till the fowl dies.

The hen's comb has been called her "certificate of health," so unerring a signal does it display as to her physical condition. An acute disease like roup does not, of course, immediately change the color of the comb, but a bright red comb can usually be counted on as an indication of vigorous health. Sometimes a pale or shrunken comb merely indicates that the hen is not laying, but a hen with such a comb should always be watched. A pale comb, combined with diminishing weight, ("going light"), suggests tuberculosis, and should subject the fowl to careful investigation, followed, in most cases, by speedy elimination. A dark comb means liver trouble, and the case should be taken in hand before further symptoms develop. When warty-looking excrescences appear of the comb and about the head, chicken-pox may be safely diagnosed.

Preliminary Treatment.

As soon as signs of disease are noted, these precautions should be taken:

1. Isolation. Remove all fowls that are in the slightest degree out of condition from the general flock at once. The trouble may not be contagious, but then again it may. In any case the sick bird is a menace to the health of the flock and can not be satisfactorily treated without removal. On a large poultry plant it is wise to have a hospital pen for birds that may be ailing. Where only a few are kept there is usually an empty pen or coop that can be used. Where the whole flock is affected, as happens sometimes with roup or chicken-pox, only general treatment of the simplest sort can be given.

2. A Purgative. This matter seems almost too simple to mention. Nine times out of ten when a fowl is sick the trouble is in the digestive tract, and a teaspoon of castor oil or Epsom salts may be all that is needed. Some expert poultrymen give their fowls Epsom salts regularly in the mash once in so often, and some give a special "course" of salts for a month in the spring to cleanse the system after the heavy feeding of the winter and prevent liver trouble.

3. Fasting. Usually a sick bird does not care to eat, but it is a good plan, especially where the dark comb indicates a bad liver, to keep all food away for a day or so. If the bird seems hungry let it out on the lawn or the alfalfa patch. Green range is the cure for many ills.

Now, as to the treatment for the diseases which are most common in a farm flock: Roup and kindred troubles, such as catarrh and swell head, are due mainly to overcrowded, badly ventilated sleeping quarters or to dampness somewhere. See first of all that conditions are remedied. Put the sick bird in an open front coop and try the potassium permanganate treatment, which is as follows: Press the nostrils together between thumb and forefinger two or three times in the direction of the beak, and press upward between nostrils and eyes to loosen the discharge, then plunge the bird's head 20 or 30 seconds in a one to two per cent solution of permanganate of potash. Give this treatment twice a day till all symptoms have disappeared.

For a simple cold indicated by running at eyes and notrils and sneezing, there is nothing better than a quinine capsule for two or three days, half a grain for half grown stock, a whole grain for adult fowls. Quinine is also sometimes effective in roup and bronchitis.

For bronchitis, which is known by a rattling or whistling sound in the throat, make a mixture of olive or castor oil, turpentine and syrup, or wine of ipecac in the proportion of a teaspoon of oil to 10 drops of turpentine and five drops of ipecac, and give two teaspoons two days in succession. I have never tried this, but it is recommended by Director Quisenberry of the Missouri station, and the ingredients are such as would be most effective with children, so why not with fowls?

For chicken pox, which is generally mild in California, anointing with carbolated vaseline may be sufficient. If it is not, soak the scabs with warm soapsuds till they can be picked off readily, and touch the sores lightly with a feather dipped in creolin.

For liver trouble cut out the laying mash and give bran, hard grain (no corn), and plenty of green feed. Put the fowls on range if possible. If not, make them scratch in deep litter for every grain.

Scaly leg is a filth disease pure and simple and has no place anywhere. It can be cured by rubbing with lard and sulphur.

Diarrhoea is due to improper feeding, foul water, unsanitary conditions and often to too much beefscrap in the mash. Remedy conditions and give castor oil.

Crop bound is quite likely to occur when fowls are fed lawn grass that has not been run through a clover cutter. Crop is hard and distended and comb pale. These cases can sometimes be cured without an operation by giving both olive oil and castor oil and then working and kneading the contents of the crop till they are loosened up. When this is accomplished, hold the bird's head down and see if you cannot work off some of the mass through the mouth. If you cannot do this, try the operation which is recommended by Dr. Sanborn:

"Pluck out a few feathers and then cut through the skin over the crop a line about one inch long. Then make an incision three-fourths of an inch long through the crop. The distention of the crop will cause the opening to

(Continued on Page 191.)

The Summer Season

Don't expect to cram for eggs in the fall without preparation during the summer.

COULSON'S EGG FOOD

used during the summer will reward you with a good egg yield in the fall. Secure it from any reliable poultry supply house.

Irrigate After Fruit is Picked

Irrigation is just as necessary after the fruit is picked as while it is forming, because it insures rapid recuperation, which means stronger trees and finer fruit the following year.

Be prepared for Fall irrigation by installing the

Layne & Bowler Pump

It will surprise you how quickly a Layne & Bowler Pump can be installed. Its simplicity, compactness, and practicability make this possible. The increased profits derived from your land will quickly repay what you invest.

Water is produced at the very lowest cost with this pump.

Estimates gladly given. Let the World's largest water developers solve your pumping problems.

Our illustrated Catalog No. 30 tells all about this pump and screen. It also gives valuable irrigating information. Write today for it.

PRIZE PHOTOS

Amateur photography is aiding in teaching many lessons, as well as in giving much pleasure. One of the most popular features of the modern magazine is the photographic page. The Cultivator is anxious to make its engraving department as strong as possible. For a few months at least we will make an especial effort along one line, and that is the reproduction of photographs showing California home life. Note the prize offer which is made on page 184 and see there some examples of former prize winners in the Rural Californian. We hope to have liberal competition, though we grant the prizes are only nominal. We trust each home owner will have an ambition to get some view of farm life in the columns of the Cultivator.

REPORT ON INSECTS

The transfer of Mr. Essig from the state horticultural commission to work in the state university will raise the question as to the issue of the revised work on "Injurious and Beneficial Insects of California," which was so popular that the first edition was soon exhausted and Mr. Essig has been working for some months on a revision which should be even more complete. On this point we are glad to say that in going to the university Mr. Essig will control sufficient of his time to supervise the publication of the revised edition.

FARMER CANDIDATES

We have from the secretary of the Farmers' Congressional League notice of a meeting of the league to be held in Chicago, August 24-25. This league and the convention are for the purpose of organizing farmers and farmer candidates in order to promote the candidacy of farmers for congress and state legislatures. Under the classification of farmers editors of farm papers are also admitted.

Perhaps political conditions are such that farmers' interests can only be protected by some such organization, but we regret that such a step is necessary, for candidates should be bigger and broader than mere representatives of one class or calling. However, the tariff and other political measures have at times shown discrimination against the farmers' interests, and if such discrimination continues perhaps the only way to secure protection is to work for one idea at a time.

DISSOLVING THE TRUSTS

Trust busting is in thoroughly good form and there seems to be no discrimination between good and bad, or, if anything, it appeals to the ordinary layman that the bad ones are let off the easier. It seems to us that the rottenness unearthed in the New Haven investigations calls for punishment of people who appear to be high in social and financial life and yet have taken the bread from the mouths of many poor people. It is probable, however, that they will never be punished. On the other hand, a big campaign has been kept up to "dissolve" the International Harvester Company. We believe this concern has never been accused of any particular wrongdoing. It is admitted that it has materially lessened the prices of many farm vehicles and implements and so far as we know has never used unscrupulous methods in crushing out competition. But it has seemed to be popular to follow it to the end, and now the ruling has been handed down that it shall be "dissolved."

WAR CAUSING LOSS.

The awfulness of the war to Europe has been freely discussed and we are now beginning to appreciate the fact that the financial loss is not all Europe's. The fumigators find the supply of cyanide of sodium jeopardized, the fertilizer people are unable to get European supplies, but, worst of all perhaps from the California standpoint, is the inability of the sugar beet growers to secure seed. California has experimented quite largely in the production of sugar beet seed, and while it is often asserted that we have conditions here which enable us to produce just as good seed as is produced in Europe, yet in practice all of our seed has been imported. The little now available has jumped in price from $8.00 to $40.00, and unless some means of evading the blockade is devised the beet planting in California another year must be greatly reduced. Of course there are a few months before planting time in most sections, but the time is certainly not sufficient to terminate war and get vessels to carrying the world's commerce so that we can be assured of a supply for another year. Our wheat growers, potato growers and others may be able to make material advance in their returns because of high prices, but generally the war makes us all suffer.

LIMITATIONS OF EXPERTS

A subscriber at Hesperia wants to know some things as to experts who are sent out to advise farmers. He writes:

"I would like to know why the horticultural bureau sends men out among the farmers to give them worthless instruction. A man sent to this district to advise concerning destruction of Russian thistle has been advising that on areas of considerable extent the farmer should wait till the thistles are dry, then fire them without cutting. That looks like good advice, but in this locality at least it does not work; even when quite dry the thistles do not burn readily, and when they have dried uncut the seeds have already been sown broadcast. I have tried it—as the horticultural bureau evidently has not—and it looks to me as if a body of that kind is worthless if their instructions cannot be depended upon.

"I hope you will encourage them to try again, and next time to verify their suppositions before they pay a man's wages and traveling expenses to publish the would-be cures. I, for one, would like to know an easy method of destroying the thistle. At present the only satisfactory way I have found is to root it up before seeding time, pile at once and when the pile is dry fire it. That means work, however."

Whether our subscriber refers to the county horticultural commission, the state commission, the experiment station of the state university or to the so-called county "farm adviser," we are not certain. First, however, a word as to "adviser." County agricultural agent is a far better term, the use of which is requested by the bureau of farm management at Washington. Inspectors or specialists or agents from these various bodies are occasionally sent into the field to give the farmers information at first hand. Often young men recently from college have been chosen for this work, and sometimes they are of a mental make-up which impels them to carry through a bluff as to a knowledge of all things. They have not yet learned the greatness of the field in which the farmer operates and seem to think that as they are sent out as specialists it would be unwise to admit a limited range of knowledge and go out to seek for the information which the farmer wants. But more often we believe these men are thorough-going workers with a desire to be helpful. They are not supposed to have all knowledge, but are supposed to be in touch with experts in various lines who can aid them and the farmers in solving perplexing problems. That the best of us make mistakes is not to our discredit. In points such as our subscriber mentions the practical farmer is able to instruct the expert. He should then be open-minded enough to carry this information on to the next and act, as does the farm paper, as a clearing house of ideas to describe practices which advance the agricultural interests of our state. Expect much of the experts which our university is sending out; in the main we believe they will come up to our expectations.

Agricultural News Notes

The American Poultry Association met in convention in Chicago, August 11.

The island of Sicily is suffering from poor crops this year, following a year of poor crops in 1912.

Stock cars, refrigerator cars and even flat cars, it is reported, will be utilized by the railroads for handling the big wheat crop of the West and Middle West. Kansas alone promises 175,000,000 bushels of wheat.

Sugar beet growing in Chile is gaining in interest. Raw sugar is now brought in from Peru and refined in Chile, though in various parts of Chile sugar beets have been successfully cultivated, yielding 15 per cent of sugar.

It is reported that three of the largest oleomargarine manufacturing plants in the United States were seized last week by the commissioner of internal revenue for defrauding Uncle Sam of approximately $10,000,000 in taxes.

The oldest seed testing station in the world is in Denmark. Founded in 1871 it was taken over by the state 20 years later. Over 14,000 seed samples were tested here in the year 1912-13. Last year the state granted the station $1000, the remaining expense is covered by fees.

To discuss measures to protect the price of cotton from the depressing influence of a protracted European war, the president of the Southern Cotton Growers' Association has called a mass meeting of all the allied interests of the cotton trade at New Orleans early in September.

"South Africa wants Pacific coast apples," says our consul at Johannesburg, "largely on account of the system of packing best suiting market conditions. Medium-sized red apples, such as Jonathans, Rome Beauties, Banana Apples, Winesaps and Spitzenbergs, particularly the last two, are preferred to other varieties."

The exportation of orchids from the Philippine Islands is increasing. In March, 1914, 10,000 plants were consigned to a San Francisco firm and arrived in excellent condition. During May 5000 plants were shipped to the same firm. The consignments included four varieties: Sollerianas, Amabiles, Studianas and Sanderianas.

A folding crate has been patented which it is claimed can be used for apples and other fruits and vegetables and makes an excellent egg carrier as well, being particularly adapted to the needs of the small shipper who can use it over and over again as the knocked down feature makes its return very inexpensive, the rate being the same as on box shooks. In order to set it up as well as take it apart no tools, nails or staples are needed.

"American crops can and must move to Europe, which must have our wheat or starve," says Secretary Redfield of the department of commerce. "If England sweeps the seas, all English merchant ships will resume their transportation of our crops," says Redfield. "If Germany is successful, her ships will carry the grain. England is, of course, our biggest customer. Another thing that will help is the bill amending our shipping laws. But even if there are not enough American ships, European nations will send others. It's their worry, not ours."

Agricultural News Notes of the Pacific Coast

Northern California

Sutter County's big fruit dryers are all in active operation.

San Joaquin expects to begin its grape shipping on August 20.

Shasta County has 12,375 bearing and 17,600 non-bearing olive trees.

Water users of Placer County are making a fight for cheaper irrigation water.

The Anderson Valley Poultry Association is planning for its fall poultry show.

The cannery at Lincoln, Placer County, is running full handed on Phillip's cling peaches.

The reclamation service is still conducting investigations as to the Iron Canyon irrigation project.

St. Helena, Napa County, is planning for its great vintage festival which will be held September 4-7.

Petaluma poultrymen are planning for the "biggest ever" at the annual poultry show to be held in November.

Sacramento Valley stock breeders are anticipating increased demand for horses because of the European war.

Yolo County papers report the farm adviser work accomplishing great results for the farming interests.

Shasta County irrigators are planning for a canal which will carry 2500 miner's inches of water and irrigate much land.

Preparations are practically completed for the coming Butte County rice exposition, to be held at Gridley, September 3-6.

Sutter County nurserymen report receiving orders for trees for next spring's planting to a far greater extent than any preceding year.

Fruit men of Lodi recently had a conference with railway traffic officials and made satisfactory plans for handling this year's Tokay shipments.

The directors of the Anderson-Cottonwood irrigation district recently held a meeting and discussed best methods of improving irrigation service.

The horticultural commissioner of Butte County is insisting that rice growers keep their fields free from weeds in order to prevent spread of pests to other growers' fields.

Chico people are endeavoring to secure the construction of a bridge or a ferry across the Sacramento in order to make better communication between that section and northern Glenn County.

Hop ranches are paying $1.25 for picking hops, which is a 25-cent increase over former prices and, it is hoped, will be an inducement to local people to take up the work rather than import help from outside.

Because of the European war thousands of carloads of the grain from the big ranches of the Sacramento and San Joaquin Valleys have piled up in the mammoth warehouses at Port Costa. The warehousemen are willing to deliver and some of the ocean freighters are willing to try, but the exporters, unable to get marine risks against capture and confiscation, will not permit their barley to be loaded on the vessels.

Central California

Alfalfa growers at Kerman are now selling at six dollars, f. o. b.

A new cream station opened at Dos Palos on the first of the month.

Tulare County oranges are running larger than usual at this date.

The bonds of the Turlock irrigation district have been approved by the state.

Fresno's special raisin train of 60 cars made the trip to Chicago in less than six days.

The Terra Bella section of Tulare County has suffered from several severe grass fires.

Dinuba reports that every ton of 1913 raisins will be disposed of before the new crop comes in.

Hollister, San Benito County has made exceptionally heavy shipments of dried peaches, pears and apricots.

A poultry show will be one of the principle features of the coming Fresno Fair, September 29-October 3.

Color will be more of a guiding factor than in preceding years in citrus orchards of the San Joaquin Valley.

Olive growers of Lindsay have incorporated and purchased a tract of land on which they propose to build a factory.

With quotations on melons as low as $1.50 per ton, Turlock and Modesto melon producers feel like going to the European war.

So much water is being taken from the Stanislaus River by irrigation districts that the bed of the river is almost dry below the intake stations above Knight's Ferry.

The Kern County board of supervisors has decided to appoint a farm adviser, and to provide his salary will make him inspector under the horticultural commissioner.

The Santa Cruz County Cooperative Forest and Home Protective Association has establishei 14 stations where fire fighting apparatus will be easily accessible.

There has been an increase of one-half cent in the price of 1912 and 1913 Seedless Muscatel raisins. This advance is supposed to be because of the shutting off of the supply of Greek currants.

Plans are being perfected for extending the Tulare County Grower's Association to include olive growers of Central California. It is also proposed to add an olive pickling and canning equipment to the Porterville cannery.

It is reported that a million and a half dollars worth of California cured fruit is now on the high seas, enroute for Europe in English vessels, and possibly subject to seizure by German cruisers.

An orange packing house at Lindsay burned on the night of the 8th, entailing a loss of $30,000. The packing house, however, will be immediately rebuilt and will be ready for the opening of the season, November 1.

Grape shipments now going out from the valley are heavy. Fruit trains are carrying the limit of tonnage with which schedule time to the east can be made. It is expected that more trains will be put on to handle shipments.

Southern California

A walnut growers association for the Hemet Valley is now being agitated.

Citrus shipments from the Riverside district have reached the 4000 car mark.

Hemet apricot orchardists have had an exceedingly large tonnage of fruit this season.

Little Rock in the Antelope Valley of Los Angeles County expects to harvest 40 carloads of pears.

The Rialto Protective Association has made arrangements for fumigation work to begin immediately in citrus orchards.

Los Angles has joined Imperial County in sending to Washington a committee to appeal for protection from the waters of the Colorado River.

The Farmers and Fruit Growers' Federation called a meeting of Riverside growers at the Glenwood, Riverside, last week to discuss a campaign against the eight-hour bill.

Poultrymen of Riverside and Arlington listened to addresses on egg production by M. A. Schofield and J. E. Davis on the evening of August 10 at the Y. M. C. A. auditorium at Riverside.

Notice is given of a called meeting of the stockholders of Palo Verde Cotton Growers' Association at Blythe, on Saturday, the 15th day of August, 1914, to consider the dissolution of the corporation and distribution of the funds among stockholders.

The federal investigation into the so-called cantaloupe trust has resulted in the indictment of 28 men and seven corporations. The Western Cantaloupe Exchange, with headquarters in Chicago and Brawley, is one of the corporations named in the indictment.

The Tri-County Cow Testing Association recently organized at Riverside, has chosen the following board of directors: A. J. Stalder, Mrs. E. M. Bird, Riverside; J. R. Elliott, Arlington; L. A. Clark, Chino; W. F. Eldredge, Wineville; Cal Puffer, Redlands and S. J. Ulrey, Ontario.

Many complaints of depredations of grasshoppers come to Horticultural Commissioner Waite of Imperial County. He recommends a poisoned mash including Paris green and states: "The adding of the chopped oranges or lemons has been found of great advantage, as it is quite attractive to the grasshoppers."

The land owners of Palo Verde Valley in Riverside County have signed a petition to the supervisors to incorporate in the September budget a special tax levy against the district for $62,000, so that funds may be made immediately available for the construction of the levee system to prevent the encroachment of the Colorado River.

An organization of Imperial Valley date growers was formed at El Centro, July 25. Members expect to make exhibits at both the San Francisco and San Diego Expositions. The directors of the association are: W. E. Wilsie, president, El Centro; W. E. Packard, secretary, El Centro; F. T. Wellcome, Brawley; Francis Heiny, Brawley; James Brock, Heber.

The Coast

Montana is harvesting its greatest wheat crop.

The cotton gin at Chandler, Arizona, is now ready for business.

Eastern Washington is having a severe contest with Russian thistle.

Good yields of alfalfa seed are reported from Chandler, Arizona, fields.

Eastern Oregon is selling mutton sheep at larger prices than for years.

Wyoming is drawing heavily upon Utah for its supply of small fruits and vegetables.

The Hop Growers' Association of Yakima County, Washington, has re-elected last year's officers.

Dry weather in Western Washington is causing serious shrinkage in the output of the hop crop.

Ranchers of Chandler, Arizona, are putting up a stiff fight against Johnson grass along irrigating ditches.

Spokane, Washington, will consume about eight cars of cantaloupes shipped in from the Yakima country.

Fruit growers are apprehensive as to the fate of their shipments now in vessels on the way to European markets.

Stock men are appearing before the interstate commerce commission at Denver to appeal for a reduction in freight rates.

It is claimed that occasionally small shipments of cattle are brought across the Mexican line without proper inspection.

There is much rivalry between farmers' unions and granges in the preparation for contests at the coming Tri-State Fair at Spokane.

Southern Idaho is planning for the marketing of its largest potato crop. Many growers have sold at the rate of $1.30 per hundredweight.

The second annual corn show under the auspices of the O. R. W. & N. Company will be held at Walla Walla, Washington, November 25-28.

Big preparations are in the making for the Southern Arizona fair which will be held the middle of next January at Tucson. An Indian festival is to be a feature attractive to visitors.

A storm has been raised among Arizona cattlemen by the increase of tax assessment on range cattle from $21 to $24 per head. Formal protest has been entered by several associations of cattlemen.

A mass meeting of ranchers was held at Chandler, Arizona, August 14, to discuss he necessity for diversifying crops. The meeting was called by the local chamber of commerce and the farmers' union.

Labor troubles in Eastern Washington are responsible, the farmers assert, for matches being hidden in bundles of grain before they are fed into threshing machines. Many valuable machines have been destroyed because of resulting fires.

More than a quarter of a million dollars was paid out during the month of July for harvesting the berry crop of the Puyallup Valley in Washington, by members of the Puyallup and Sumner Fruit Growers' Association. This did not include cost of transportation.

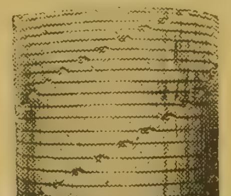
SILOS

All sizes and dimensions made to order for your particular conditions.

This is a Photo of the 20x40 Redwood Stave Silo Manufactured and erected by us on the Sheldon ranch, Kenwood, California.

TANKS

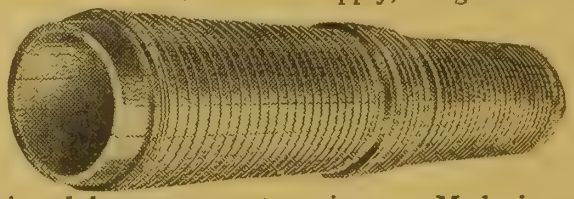
From 500 to 500,000 gallons capacity.



Built to suit All Uses and Users. Cheaper than Metal Tanks, last 10 times as long.

PIPE

Machine Banded or Continuous Stave. For Water Supply, Irrigation or Power.



All Designed by our expert engineers. Made in our own immense factory from clear, air-dried redwood, selected from Air-Dried Stock of 40 Million Feet, which we carry at our plant at ALL times. Write Us for Prices.

Redwood Manufacturers Co.
Fully Paid Capital, $1,000,000.00
8 04 KOHL BUILDING SAN FRANCISCO

Selling Like Hot Cakes

A Big Hot Spark

A Quick Start

No Batteries No Coils No Troubles

ALPHA GASOLINE ENGINES are equipped with new gear-driven built-in magneto, which eliminates all batteries.

ALPHA ENGINES start on the magneto without turning them over and they require no cranking.

ALPHA ENGINES are low fuel consumers, with high efficiency, and are the highest grade, most reliable gasoline engine that money can buy.

ALPHA ENGINES are especially adapted for irrigation plants and they have that ability to stay on the job 365 days in the year and 24 hours per day.

ALPHA ENGINES CAN BE FURNISHED WITH SPECIAL CARBURETOR FOR USING LOW GRADE DISTILLATE OR TOPS.

ALPHA ENGINES were awarded the gold medal at the California State Fair last season and were in competition with about thirty-six other engines.

Investigate the Alpha before buying.

Write for our large illustrated Alpha Catalog A.

SAN FRANCISCO SEATTLE

We Manufacture the Ideal Green Feed Silo

Make Your Own Cement Fence Posts

We furnish full illustrated plans and specifications showing how to make complete outfit for making reinforced concrete posts for only a few dollars, and also how to make the posts at low cost. With the outfit equipped with

our improved metal fastenings, any ordinary workman can rapidly make posts that should last forever. Every person needing posts should have one. Our method of reinforcing is simple, strong and inexpensive.

Instructions by practical cement man. We will ship, charges prepaid, a full set of metal fastenings also plans as above on receipt of only $5.00. Reference, Home Savings Bank.

American Cement Post Co. 215 West 7TH St. Los Angeles Calif.

Live Stock and Dairy

SHEEP ON THE SMALL RANCH

(Continued from Page 171.)

A strong vigorous ram of sufficient age (two or three years) will care for forty to fifty ewes. Yearling rams are less prolific than older ones.

Feed.

As to feeding, especially preparing lambs and older stock for market, it will be of interest and value to know what has been done in an experimental way. Since the California agricultural experiment station has reported no work in sheep feeding, I will quote from stations in the middle west, taking reports as compiled by W. A. Henry in his "Feeds and Feeding."

Grazing on Annual Pastures.

Keeping sheep chiefly on pastures specially sown for them was first practiced in America at the Minnesota station in 1895 by Shaw, who writes thus of the system: "It enables the flockmaster to maintain a much larger number of animals than he otherwise could. It makes it possible for him to give them more or less of succulent pasture from spring till fall, which is favorable to their development. It enables him to destroy cheaply and effectively nearly all kinds of weeds and to fertilize his land so that it will be in a good condition to grow other crops." In one trial Shaw grazed two lots of ten 80-pound yearling wethers for 112 days on the following succession of pastures: Winter rye, peas and oats, barley and oats, rape, kale, peas and oats. Lot II received 0.5 pound of oats per head daily in addition to pasture. The results of the trial are given below:

Grazing yearling wethers on special crops with and without grain:

Average Ration	Average Daily Gain, Lbs.	Average Total Gain, Lbs.
Lot I pasture........	0.15	16.8
Lot II pasture and 0.5 lb. oats	0.24	26.9

While the gains were not remarkably large with either lot, they were all that could be expected during warm weather. Lot II gained 60 per cent more than Lot I, which received no grain and was in better condition at the close of the trial. The increase in gain was worth more than the cost of the grain fed.

Common Fodders.

At the Michigan Station Mumford fed 6 lots, each of ten 75-pound lambs, for 98 days to test the value of various roughages. Each lamb received 1.4 pounds shelled corn and 1.2 pounds rutabagas daily, together with the dry fodder shown below:

Comparison of various roughages for fattening lambs:

Daily Allowance of Dry Roughage	Average Daily Gain Lbs.	Average Total Gain Lbs.	Feed for 100 Lbs. Gain Corn Lbs.	Feed for 100 Lbs. Gain Dry Fodder Lbs.	Feed for 100 Lbs. Gain Roots Lbs.
Lot I, clover hay 1.3 lbs.	0.35	34.4	395	373	340
Lot II alfalfa hay 1.3 lbs.	0.35	34.4	395	373	240
Lot III, millet hay 1.0 lbs.	0.26	25.8	523	372	453
Lot IV, corn stover 1.4 lbs.	0.31	30.2	451	462	387
Lot V, oat straw 1.4 lbs.	0.29	28.5	478	489	411
Lot VI, Bean Straw 1.5 lbs.	0.30	29.6	463	488	395

In this trial alfalfa hay proved slightly superior to clover hay. Concerning millet hay, which gave the poorest returns, Mumford writes: "More care is necessary in feeding millet hay to fattening lambs than any other coarse fodder. Unless fed in small quantites it induces scouring. Lot IV, given corn stover cut into 1.5 to 3-inch pieces with a silage cutter, made nearly as large daily and total gains as Lot I, fed clover hay, and consumed only a little more feed for 100 pounds of gain. This shows the high value of good corn stover for lambs. Oat straw proved inferior to clover or alfalfa hay, yet Lot V, receiving this fodder, made large and economical gains. Experienced feeders will agree that the fair returns from millet hay and the good returns from corn stover and oat straw were made possible in this trial because roots were fed with them. Bean straw proved a good substitute for clover hay."

Sorghum Hay.

At the Nebraska Station Burnett fed three lots, each of 12 lambs, averaging about 60 pounds, for 98 days on the rations given below:

Sorghum hay compared with alfalfa hay for fattening lambs:

Average Ration	Average Daily Gain Lbs.	Average Total Gain Lbs.	Feed for 100 Lbs. Gain Concentrates Lbs.	Feed for 100 Lbs. Gain Hay Lbs.
Lot I, alfalfa hay 1.7 lbs, shelled corn 1.4 lbs...	0.32	31.3	424	519
Lot II, Sorghum hay 1.7 lbs., shelled corn 1.3 lbs...	0.21	20.2	612	818
Lot III, Sorghum hay 1.7 lbs., shelled corn 1.1 lbs., linseed meal 0.2 lbs.	0.27	26.8	502	617

The lambs fed sorghum hay and shelled corn made only two-thirds as large gains as those fed alfalfa hay and corn, and required nearly 200 pounds more grain and 300 pounds more roughage for 100 pounds of gain. The lambs fed 0.2 pounds of linseed meal in addition to sorghum hay and shelled corn made heavier and more economical gains than those getting no linseed meal. The report states that during the last two weeks of the trial the lambs fed sorghum hay and corn tired of the ration and ate poorly, while those getting linseed meal in addition to the sorghum hay and corn ate well and made good gains throughout the trial.

Rape.

At the Ontario Agricultural College, Shaw pastured three lots, each of 15 lambs averaging 71 pounds in weight. Lot I was given no additional feed; lot II was fed 0.5 pound of oats each daily, and lot III had the run of an adjoining grass pasture in addition to the rape. The acre of rape lasted each lot 58 days, during which time the lambs made the gains shown in the table:

How Fed	Average Daily Gain Lbs.	Average Total Gain Lbs.	Gain in Weight from 1 Acre Lbs.
Lot I, rape only......	0.39	22.9	344
Lot II, rape and 0.5 lbs. oats	0.40	23.7	348
Lot III, rape and grass pasture	0.47	28.0	420

The addition of oats to the rape ration did not prove economical. The value and importance of grass pasture in supplementing rape for sheep feeding is strongly brought out by the larger daily and total gains made by Lot III. It is shown that an acre of rape will put from 300 to 400 pounds of gain on lambs grazed thereon.

At the Ontario College 54 acres of rape pastured 17 steers and 537 sheep, 1 acre lasting 12 lambs for two months. At the Michigan station 15 acres of rape pastured 128 lambs for 7.5 weeks, during which time they gained 2890 pounds in weight. It was estimated that one acre of rape pastured 9 lambs 7 weeks, producing in that time 203 pounds of increase.

Corn Silage and Mangels.

The Iowa Agricultural College fed 79-pound lambs for 112 days on corn silage or mangels in combination with alfalfa hay with the results as shown in the table:

Corn silage compared with mangels for fattening lambs:

Average Ration	Average Daily Gain Lbs.	Feed for 100 Lbs. Gain: Grain Lbs.	Roots or Silage Lbs.	Hay Lbs.	Cost for 100 Lbs. Gain Lbs.
Lot I, mixed grain 2.0 lbs., corn silage 1.4 lbs., alfalfa hay 1.6 lbs.	0.42	463	327	367	$5.90
Lot II, mixed grain 2.0 lbs., mangels, 4.3 lbs.	0.44	450	986	357	6.82
Lot III, mixed grain 1.9 lbs., alfalfa hay 1.7 lbs.	0.37	511	......	464	6.33

In this trial the lambs were all heavily fed on grain and made correspondingly large gains. The lot fed corn silage made almost as good gains as that fed mangels, and at considerably lower cost for feed consumed.

Indian Corn.

The table below gives the results of four trials with corn for fattening lambs at western experiment stations:

Fattening lambs on whole corn and hay:

Experiment Station	Av'g ration Corn Lbs.	Av'g ration Hay Lbs.	Av'g daily gain Lbs.	Av'g total gain Lbs.	Feed for 100 lbs. gain Corn Lbs.	Feed for 100 lbs. gain Hay Lbs.
South Dakota	1.5	1.3	0.28	30.5	561	485
South Dakota	1.6	1.5	0.35	39.0	466	431
Wyoming	1.1	1.7	0.29	28.6	381	584
Nebraska	1.0	1.4	0.33	31.9	308	412
Average of four trials	1.3	1.5	0.31	32.5	429	478

The lambs gained slightly more than 0.3 pound per head daily and required about 425 pounds of corn and 500 pounds of alfalfa hay for 100 pounds increase.

Wheat.

In the following table are summarized the results of five trials at four stations with whole wheat and hay for fattening lambs.

Fattening lambs on whole wheat and hay:

Experiment Station—	Av'g ration Whole wheat Lbs.	Av'g ration Hay Lbs.	Av'g daily gain Lbs.	Av'g total gain Lbs.	Feed for 100 lbs. gain Wheat Lbs.	Feed for 100 lbs. gain Hay Lbs.
Michigan	1.3	1.3	0.24	21.7	553	552
Montana	0.8	2.0	0.27	25.3	302	767
Utah	0.9	1.2	0.19	17.0	454	657
South Dakota	1.5	1.3	0.28	31.5	532	469
South Dakota	1.5	1.3	0.28	31.5	536	470
Average of five trials	1.2	1.4	0.25	25.4	475	583

In round numbers the Michigan lambs required 550 pounds each of wheat and red clover hay for 100 pounds gain. The Montana range lambs, in excellent condition when the trial began, consumed only 300 pounds of good wheat and nearly 800 pounds of clover hay for 100 pounds gain. The South Dakota lambs were fed mixed brome and prairie hay with bread wheat in the first and good durum or macaroni wheat in the second trial. Compared with the corn fed range lambs reported below the wheat fed range lambs required from 50 to 75 pounds more grain and 100 pounds more alfalfa hay for 100 pounds gain. This shows that wheat is less valuable than corn for fattening lambs.

Barley.

Throughout the western range district barley is used for fattening sheep and lambs. Below are given the results of five trials at western experiment stations with barley and hay for fattening range lambs.

Fattening range lambs on whole barley and hay.

Experiment station—	Av'g ration Barley Lbs.	Av'g ration Hay Lbs.	Av'g daily gain Lbs.	Av'g total gain Lbs.	Feed for 100 lbs. gain Barley Lbs.	Feed for 100 lbs. gain Hay Lbs.
Montana	0.7	2.1	0.27	23.7	253	763
Montana	0.8	2.1	0.26	24.3	316	819
South Dakota	1.8	1.0	0.36	37.9	509	263
South Dakota	1.6	1.3	0.26	28.5	617	518
Wyoming	0.8	2.8	0.33	29.6	257	834
Average of five trials	1.1	1.9	0.30	28.8	390	639

In round numbers the Montana lambs consumed less than 300 pounds of barley and 800 pounds of clover hay for 100 pounds of gain, while the South Dakota lambs required from 500 to 600 pounds of barley and only 400 pounds of prairie hay. It is shown that the lambs fattened on barley required about the same amount of grain and 100 pounds more hay than corn fed lambs for 100 pounds gain. Whole barley was satisfactorily masticated and digested by the lambs and the beards with rare exceptions caused no injury to their mouths. Whole barley is only slightly less valuable than corn for fattening lambs.

I have run the risk of wearying the reader in order to show the large variety of feeds that may be furnished sheep with assurance of rapid growth. Henry gives many more experiments but I have selected such as contain feeds more or less common in California. It may be that some of our cheap barley may with profit be fed to lambs that are yet to go to market. The experiments

(Continued on Page 191.)

Don't delay buying a
DE LAVAL
SEPARATOR
a single day longer

IF YOU ARE SELLING cream or making butter and have no separator or are using an inferior machine, you are wasting cream every day you delay the purchase of a De Laval.

THERE CAN ONLY BE TWO real reasons for putting off buying a De Laval; either you do not really appreciate how great your loss in dollars and cents actually is or else you do not believe the De Laval Cream Separator will make the savings claimed for it.

IN EITHER CASE THERE IS one conclusive answer; "Let the local De Laval agent set up a machine for you on your place and SEE FOR YOURSELF what the De Laval will do."

YOU HAVE NOTHING TO risk and a million other cow owners who have made this test have found they had much to gain.

YOU CAN'T AFFORD TO wait till next spring. Let the De Laval start saving cream for you RIGHT NOW and it will earn its cost by spring.

SEE THE NEAREST De Laval agent at ONCE or if you do not know him write us direct for any desired information.

SEND THE PHOTOS

Since the lists of the Rural Californian have been united with the California Cultivator we have planned the adding of various features which were justly popular in the Rural. One of these is the photo contest. In the first issue of each month we wish to use engravings furnished by subscribers. To give an idea of some of the photos which were submitted in the Rural contest, we reproduce engravings used in that magazine, as shown on this page. What we want is farm life or rural home life. Animals or children do not necessarily have to enter into it, but we believe they add to the attractiveness of the picture.

Sleepy Toodles, a Prize Winner

For the first issue of September we will want photos in hand by August 28. We grant this gives short notice for the first competition, but let everybody get busy and send us in something. This will give practice for the competition in the October contest.

The prizes will be cash, $2.00 being given for the best photo and $1.00 for the second best. Bear in mind and make it a scene on the farm—in the poultry yard, in the orchard, or in or around the home. For engraving we must have reasonably sharp, clear, "contrasty" photographs. These points are more important than that of size. Many illustrations have been used in the columns of the Cultivator from negatives which were only 1¾x2⅜ inches in size. Of course, as a rule, the larger photo is better. It should be 4x5.

The same prizes will be given for photos for the first issue in October. They should be in this office by September 30 or sooner.

SUDAN GRASS

We recently gave a short article touching upon Sudan grass, and learning of its production in Texas we wrote regarding it. We have from the manager of the Sudan Grass Seed Association information that the department of agriculture has issued a bulletin on this recently introduced grass. From the bulletin we are given the following analysis:

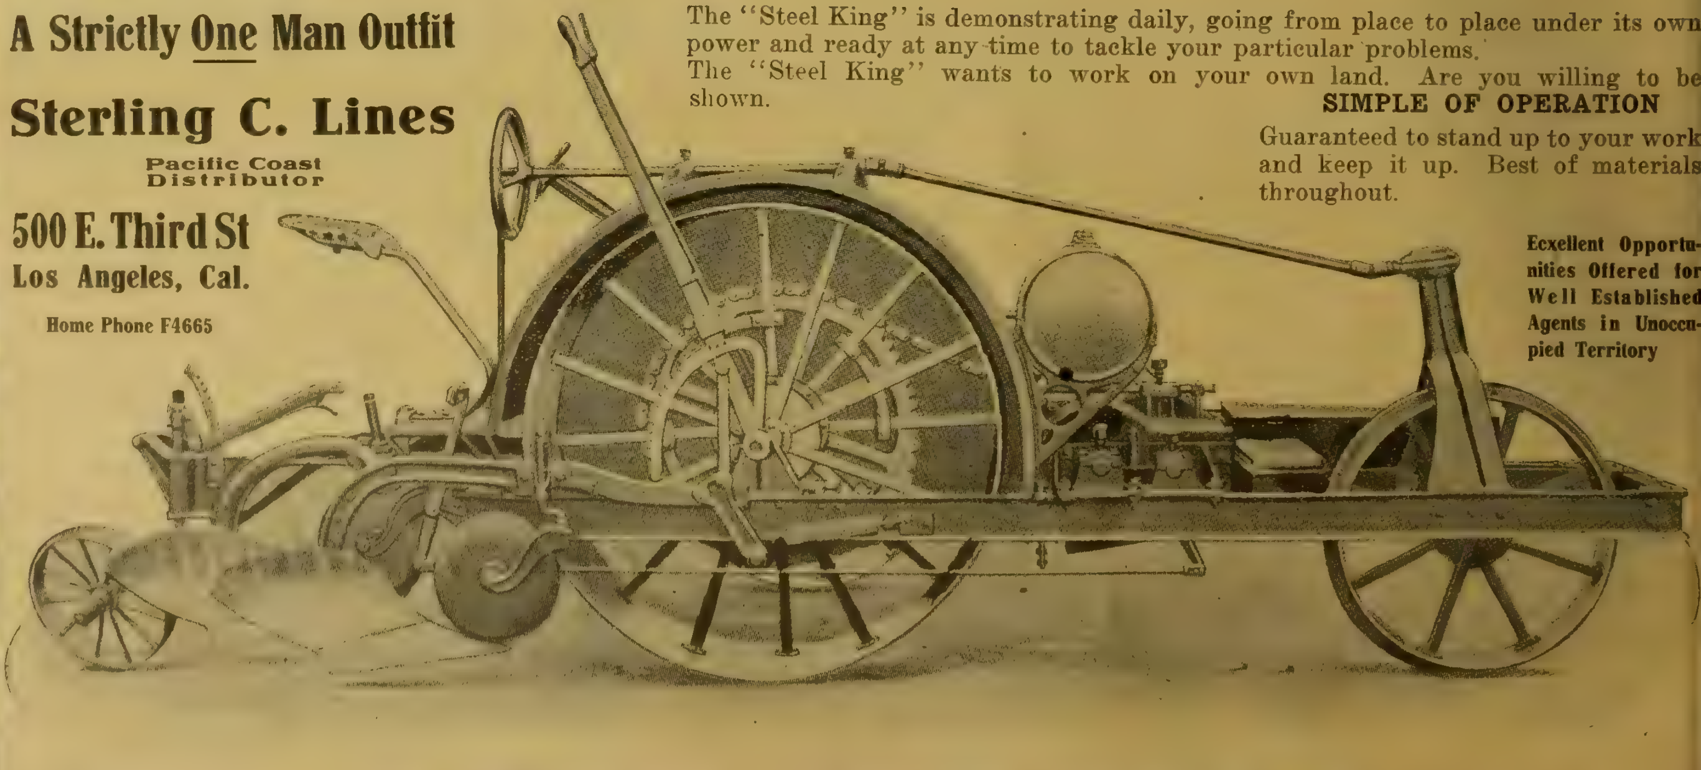
Tired, But Faithful to His Chums

Moisture	5.81
Ash	8.15
Ether Extract	1.68
Protein	9.13
Crude Fiber	26.75
Nitrogen Free Extract	48.48

Mr. Briggs, secretary of the association, advises:

"As to rainfall, in the experience of the farmers here, the grass seems to grow under almost any condition of rainfall. Last year several of the best crops had little or no rain upon them during the entire growing season. This year, under heavy rainfall, it is doing equally well, the only difference being that the yield will probably exceed last year's. The grass is one of the greatest drouth resisters known, and, in my opinion, backed by those who have grown it for three years, it is the best hay for all semi-arid regions, especially, but is also good where there is plenty of rainfall.

"As to the best time of the year for planting, here we plant it just as soon as the danger of frost is over and the ground is thoroughly warmed up. As to whether it will grow in your winter season, I am not prepared to say. However, we know of several crops that were harvested some three weeks ago, for the first time, in your state. With the long growing season in California farmers there should be able to get several crops of hay each season. We can get from two to three here in a shorter season."



Steel King Motor Plow

$1050 F.O.B. Los Angeles

Sold Under a Guarantee

Saves at least **One-Half** the expense of **Plowing, Discing, Harrowing, Seeding, Cultivating, Hauling,** Etc.

Power Equals 8 Work Animals

MOTOR PLOWS ECONOMICAL

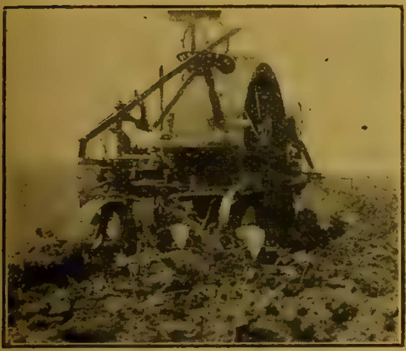
Is it economical to use power on the farm? Especially is it profitable to use other than horses to propel the plow, the disk and other small farm implements? An admirer of the motor plow submits the following:

"This service, in order to be effective must secure the following advantages of the motor as against the use of animal power:

"A. The initial cost must be less, or at most not more, than the cost of the same animal power.

"B. The expense of operation must be lower than that of animal power for the same work done.

"C. The implement and the motor must be built to stand to the work, no matter how trying the circumstances or conditions of operation.



Ready for a Day's Work

"D. It must be able to do what is done by animal power with equal facility. This means it must be light weight, flexible and easily handled and also have the faculty of turning within a short radius.

Plowing With Gasoline Costs Less Money

"E. The maintenance expense of the machine must not exceed the maintenance expense attached to the equivalent animal power.

Disking Green Manure Crop With Hood Arranged Over Motor So As To Protect Trees

"F. The depreciation expense of the machine should not exceed the depreciation expense of equivalent animal power.

"The initial cost may be close to $1000. The initial cost of the eight horses or mules, which it will replace, is $1600. In this connection it is well to state that the pull of a small motor plow is equal to six large animals, while it travels 30 per cent faster, making it equal therefore to the work of eight horses. Remember, these figures are conservative and safe, and result from repeated and careful comparisons under many different conditions of operation.

"The following table, computed from actual field work, shows in a striking manner comparative operating costs. An average of these figures for different kinds of labor shows a clear saving of more than 50 per cent in favor of the motor:

WORK DONE BY MOTOR PLOW		Plowing			Harrowing				
		Rolling adobe lands very hard and dry	Dry clay fairly heavy 3-10"	Moist sandy loam splendid condition 2-14"	Heavy adobe soil	Moist clay loam	Cultivating 10-year citrus grove	Mowing wheat 35 bu. to acre	Hauling good roads

Per cent saving of motor over animals, per acre		51	54	47	59	57	45	....	....

"A small machine of this kind weighs about as much as two large horses and plow, or about 3500 pounds. It turns in a small radius, travels over freshly plowed soil easily and is steered as conveniently as an automobile.

"The maintenance expense under ordinary care in handling may be as low as 15 cents per hour while under full operation. To maintain eight working animals in first class condition costs 40 cents per hour of work based on a day of 10 hours. The expense of keeping eight working animals per year averages from $800 to $1200, and they are equal to not more than 200 days of labor per year.

"An average good work horse, in prime condition, costs $200. He will depreciate on an average of 10 per cent, or $20 per year. Hence the depreciation on eight such animals is $160 per year. The small tractor or motor, under constant operation, can safely be considered not to exceed this same amount, $160, of depreciation."

Too many fellows are standing broadside to the trough.

STILL HANGING ON

Pat applied at the wharf for work as a stevedore. He was only four and a half feet in height, and the boss was dubious. "We're loading 300 pound anvils into that steamer," said he, "and a little runt like you couldn't handle 'em." "Try me," said Pat. And the boss put him to work. Pat hustled the anvils aboard all right. The cargo was nearly all stowed in the hold when the boss heard a splash. He ran to the rail, and looking over, saw Pat struggling in the water. "Throw me a rope!" he yelled, as he went under. He came up, called for a rope and went under again. Again he rose to the surface. "If you don't throw me a rope," he spluttered angrily, "I'm going to drop this anvil."

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Initiative and Referendum

Please give information regarding the different questions to be voted upon at the November election.—Subscriber, Manzanar.

We will endeavor to give an outline of these questions in a later Cultivator. There are more than 50 of them so that we can only give the merest outline, which will be done as soon as possible.

Aphis

I send a watermelon leaf which seems to be affected with disease. The plants are on good rich soil, are vining well, but some are wilting at the root. Ants and ladybirds are working at them. What is the trouble?—Subscriber, El Cajon.

From the appearance of this leaf would say it is one of the worst infestations of melon aphis we have ever seen. The leaf is one mass of dried mites which appear like aphis. In addition it is covered with black smut or fungus which usually comes with this insect. Spraying with any of the weaker contact insecticides is effective, though as a rule little attention is given to spraying of melons. The first appearance of the infestation should be met by pulling and burning the entire vine. Keep the weeds down around the field and give no chance for the pest to spread. Earlier in the season the state horticultural commission supplied colonies of ladybirds, but it would probably be too late to get any for this particular infestation. The wilting from the root as mentioned sounds like melon blight and for that there is no help other than complete destruction of the vine to prevent its spreading.

Name of Bird

I have noticed a bird about the size of a robin, which sits on the fence and darts into the air catching insects. The male is black with white spots on wings. Does this bird eat bees?—Subscriber, El Cajon.

As a rule birds do not molest bees. We cannot say in this particular case. It is possible the bird is one of the fly-catching family and our judgment would be that it is beneficial. Can any of our subscribers give us the name of the bird?

Teacher's Examination

Is a student graduating from high school allowed to take examination in Tulare County to teach country schools?—Subscriber, Portersville.

We believe that anyone is permitted to take the examination, whether a graduate from any school or not.

Soap Powder Sprays

I see a great deal about using soap powders of various brands for black scale. Are they of any value on olive or orange trees which are very scaly? The trees are young and I wish to avoid fumigation for the time being.—Subscriber, Nordhoff.

When the scale is young, as at this time of the year or for another month or two, simple soap washes prove very effective. They are easily mixed and with young trees may stand off fumigation a year or two. The strength varies from six to 12 gallons of water to each pound of soap. We do not think any particular brand has any great advantage, for bar soaps and soap powders are much the same, the cheaper brands, if anything, will prove the more effective because of their rosin content.

San Luis

I have taken the Cultivator for over a year now and with all the information given in regard to different farming countries I have never seen any mention of San Luis Obispo County. Is it not a good farming country?—Subscriber, Santa Ana.

California would not wish to get along without San Luis Obispo. It is, however, a very modest county and has not sung its own praises very loudly, and its hills and fields have been given over quite largely to the live stock industry. The fruit industry has been discouraged by refusal of its supervisors to appoint a horticultural commissioner, and fruit growers naturally question the wisdom of going to such a section to take up that industry. The risks are great naturally and when the county refuses to protect the industry it might be unwise to make investments, but for live stock, general farming, sugar beet raising and many other lines, San Luis Obispo County offers rich opportunities.

Celery Plants.

Where can I get celery plants?—Subscriber, National City.

Any seedsman advertising in the Cultivator can supply you.

Grape Juice

Can you tell me the present condition of the grape juice market Is it controlled by a few large concerns and is the demand for this product increasing? What varieties of grapes are best for manufacture of the juice? Can these varieties be grown successfully near the coast in Southern California? Would also like to know the value of the product as a food and the reasonable return per acre from land well adapted to this industry.—Subscriber, Saticoy.

The grape juice market has not yet reached a thoroughly dependable condition, at least not for California-produced juice. One large concern which was started near Lodi found a most discouraging reception for its production and we believe has ceased to operate. We presume there is more Eastern-manufactured grape juice sold in California than there is of California-made. The consumer's taste seems to demand the flavor of the Eastern grape.

The California grape as a rule has given a very mild, sweet juice, much preferred by some of us to the Eastern product, but unfortunately not by the general trade. The expense of sterilization is so great that it has forced the price up so that consumption must be most limited. If this manufacturing cost could be reduced so as to greatly increase consumption, and we believe it can be, and an advertising campaign carried on, there should be a great market for California grape juice. As to varieties, would suggest that the inquirer write Dean Thomas F. Hunt, director of the state experiment station, Berkeley, and ask for Circular No. 108. On page 11, varieties, together with analysis or table of composition of each, is given. Grapes are recommended both for the coast region and for the interior. The value of grape juice as a food is high. California juice, being richer in sugar and lower in acid than the Eastern, a market should be developed for it.

Irrigating Corn.

Does corn require more water when it is blooming and forming ears? Is there a way of spraying to prevent worms entering the husks?—Subscriber, Gridley.

We would prefer, if possible, to have thorough irrigation somewhat precede the blooming time, but without question the corn should be well supplied with water for there is heavy drain to supply the exceedingly large growth made at that period in the life of corn. There is no very satisfactory way for disposing of the corn ear worm. We would refer our subscriber, however, to the issue of July 30, where Mr. L. L. Whiting, Winchester, tells of his method of using aloes, asserting that it is accomplishing good results.

Possibly Blight

I send small twig from apple tree which appears to be affected with a fungous growth. This trouble seems to appear only on the new growth and I am not sure that more than one variety is affected. The trees are grown at an altitude of 4000 feet, under desert conditions.—Subscriber, Tehachapi.

The description is not quite definite enough to be sure, but the fact that the trouble attacks the younger growth seems to indicate fire blight. In this case the tender top is first affected and the trouble proceeds down the branch until the larger limbs are affected. The only remedy is cutting out the diseased branches, sterilizing instruments between cuttings.

Boy's Name.

Where a woman has a son by a first husband and marries again, whose name does the son take, that of the first or second husband?

Unless legally adopted the boy would carry the name of his father.

Feed for Hogs.

State the relative values of Egyptian wheat and kaffir corn or milo maize for hog feed? Does the green fodder make good feed and can they be successfully fattened on the grain, and which is best?—New Subscriber, Merced County.

It is difficult to advise you about your problem without knowing whether you are dry farming or irrigating and how you are handling your hogs. If you depend on winter moisture for your grain crop, wheat or barley sown in the fall, so as to get the benefit of all rains would probably make you the best yields. Wheat (either Egyptian or common wheat), grows best in cool weather and in order to get a satisfactory crop of corn with only the winter moisture, the ground must be continually cultivated to conserve all the moisture possible, before the corn is planted. If you irrigate, corn planted in May or June would doubtless give you a larger yield than wheat. Both are good feeds for hogs and the relative value would depend on the condition of the hogs, and what other feed is used. We do not find any experiment station tests to compare these feeds, but our judgment is that there would be practically little difference pound for pound. Grow the one that will give prospect of the greatest tonnage of grain per acre. Green fodder is valuable for succulent feed but when fed green will not give the fattening value of the matured grain. After the grain has matured

the dry fodder has little value for hogs. For best results in feeding either wheat or corn to hogs they should have alfalfa pasture or green alfalfa cut and hauled to them.—W. S. G.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Lung Worms

I have cows which have a bad cough. Think it got into the herd from a calf which I bought to raise, and which soon took sick and died. I cut it open and found the lungs filled with a cheesy matter, which I afterwards concluded was worms. I used turpentine twice a day for a week with the rest of the cows and another one of them died. Also gave other medicines with little benefit. The veterinarian here did not seem to know what to do for the trouble. Can you suggest a remedy? — Subscriber, Bakersfield.

If the trouble is lung worms, as you seem to think, the turpentine should have helped them some. If you still think the trouble is due to worms, have your veterinary inject a teaspoonful of turpentine into the windpipe with a hypodermic syringe. That is the most direct way to get at them and will probably end the trouble.

Milk Fistula

I have a half-breed Toggenburg goat that was cut on the side of teat by a wire. The wound has healed and left a small opening the size of a pinhead that leaks milk all the time. Can anything be done for it? —Subscriber, Palm Springs.

It will be a difficult matter to close the opening while there is a great flow of milk. When the goat is dry it will be an easy matter. Split the skin and flesh of the teat up and down right through the opening, being careful not to cut through into the milk duct. Dissect out the little fistula and close the wound with two stitches and wipe dry, then cover the wound with a thin coat of collodion. When this heals the opening will probably be closed. If the operation is performed while there is a flow of milk you should insert a self-retaining milk tube and leave it until the wound is perfectly healed.

Indigestion

Have a Holstein cow which pants with her tongue out just like a dog when it is warm. In the morning when it is cool she breaths like she was tired or warm. She is in ordinary flesh for a dairy cow and gives a large flow of milk. Has a calf about two months old. What is the cause and is there any remedy?—Subscriber, Tulare.

Probably it is indigestion. An overloaded stomach would be accompanied by such symptoms as you describe. Get half a gallon of raw linseed oil, half a pint of turpentine and one ounce of aloin. Mix and divide into four doses. Give one dose every two or three days.

Sluggish Liver

I have a cow that has been fresh for ten days. At first she seemed to be all right, but now seems dull and does not eat as much as usual. The milk is still thick and yellow, as it was when she first came fresh. One of the teats gives milk that is lumpy and a little bloody. Am feeding just alfalfa hay. What can be done?—Subscriber, Hughson.

The secreting organs are not acting right. Give the following medicine to stir up the liver and stomach and you will probably see no more trouble. Get your druggist to prepare raw linseed oil, one quart; turpentine, four ounces; aloin, one ounce and pulverized nux vomica, one ounce. Mix. Shake well and divide into three doses. Give doses three days apart. Also get two pounds of Epsom salts, one pound of common salt and four ounces of gentian. Mix and give a handful once a day.

Dog

We have a French silk poodle dog seven years old that has usually been well except once in a while when she becomes stiff and finally vomits foam or a yellow, greenish substance and sometimes only the food.

For several years during the summer she has had sores come on her back varying in size from a quarter to a half-dollar. The skin seems natural before they come, but she begins biting and licking on a certain spot until it is raw and remains so for a week. This one will heal up and another come. Is it contagious so people might become affected with it and what can we do for it?—Subscriber, Pasadena.

It is not contagious, but is due to bad blood. The vomiting of yellow, greenish bile was bilious indigestion caused by too much food and not enough exercise. It has become chronic and can only be relieved, but not cured. The remedy is less food, more exercise and little or no meat. Raw liver is best if any is given. Keep the bowels open by giving one grain of calomel at night, once a week, followed by a tablespoon of a strong solution of salt water the next morning. Also give 10 grains of cream tartar twice a week. Keep this treatment up until her flesh is reduced and the irritation stops.

Sore Neck

I have a mare five years old with quite a number of little sores on the top of her neck and at times she seems to be in great pain. She has had this for a year or more and seems to feel them worse in the heat of the day. I have tried several remedies, but with no results. Kindly let me know what to do for it.—Subscriber, Tulare.

First clip off the hair very close. Then with soap and warm water scrub the parts clean. Get your druggist to prepare the following: Dilute acetic acid, one pint; acetate of lead, one ounce, and add sulphuric acid, one-half dram. Mix well. Every evening wash the parts clean with cold water and rub dry. Then shake the lotion and apply enough to wet the parts.

Sweeney

Have a three-year-old mule with a sweeney of the shoulder caused by working on a harvester about three months ago. I blew it up twice with a bicycle pump and for a while it looked all right, but now it is getting worse again. The skin is hard and sticks to the bone. Please advise me what to do with it.—Subscriber, Porterville.

Three-year-old horses or mules should not be worked. Their muscles are tender and a sudden jerk or strain is liable to ruin the animal, as you have found out. A good treatment for sweeney is to put a tape about an inch wide under the skin the whole length of the muscle that is affected. Cut a hole about an inch long at the upper and lower end of the sweeney and, with a blunt needle threaded with the tape, pass it under the skin from the upper to the lower opening. Draw the tape through and tie large knots on each end so it cannot come out. The tape should be oiled with castor oil and turpentine before using it and it should be moved up and down every day until the muscle fills up to its natural size. Then remove the tape and wash out the canal with a good antiseptic solution. Once the muscle is filled up it will probably stay so. To soften the skin keep it well greased with lard. You really should have a veterinary to treat it, as it will require skill and instruments that you would not have.

For Sale—Two thoroughbred registered Hampshire belted boars, five months old. Extra fine stock; $25 each f.o.b., Oceanside. Ben F. Thorpe, Bonsall, Calif.

Thoroughbred Berkshire Boars of all ages from developed and large-boned hogs. Riccomi Bros., Mountain View, Cal.

For Sale—Young registered Berkshire boars and sows; fine strong stock; boars ready for service. Stanislaus Ranch Co., Crows Landing, Calif.

Glenview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

TREES.

For Sale—One and two-year-old Washington Navels and Valencia Orange Trees. Eureka Lemons and Marsh seedless grapefruit, for Spring 1914 delivery Write for prices, or call and examine stock at Morris Citrus Nurseries, Cor. Juanita and Valley Center, R. F. D., Box 34, San Dimas, Cal.

Now is the Time to book your order for fig trees. "My specialty." 25,000. Seventeen varieties, extra fine, well rooted, straight and branched, one and two year old trees. Price list on application. C. C. Terbush, R. 2, Box 543, San Gabriel, Cal.

For Sale—50,000 Sour Orange seed bed stock, finest quality, or will let to responsible party on percentage basis; also 2000 A1 late Valencias, two years old next spring, or might exchange for Washington navels. H. H. Eshelman, Soldiers' Home, Cal.

For Sale—A block of 3000 Valencias, 1000 navel and 1500 lemon trees, grown between orchard rows and must be moved at once. Prices right for quick deal. Also have budded and seedling Avocados. Smith-Roberts Nurseries, Tustin, Cal.

The 1200-Acre Nursery, growers of 1500 varieties of trees and plants. OREGON NURSERY CO. Orenco, Oregon. Sales office, 522 Chamber Commerce, Los Angeles, Cal.

1000 Avocado Seedlings—Pots, also can furnish nice plants, bare root, at low price. A. A. Quint, R. D No. 2, Pasadena, Cal.

For Sale—Eureka Walnut Trees, budded on Native Black Walnuts. Choice stock. Order immediately Don't delay. Wm. Holve, Fullerton, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

You Future Nurserymen—Write for prices on special stocks of plants to start business with. Ballou's Nursery, Pasadena, Cal.

Budded Citrus Trees and seedlings at fair prices Will take auto or land. J. P. Butler, Jr., P. O Box 145, Lamanda Park, Cal.

MISCELLANEOUS.

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

For Rent—400 to 750 acres of land in Tulare County. Five miles from the town of Tulare. Fifty acres now in alfalfa. Will put in as much more as desired. Improvements consist of house, barn, fine cow barn, pumping plant; also plenty ditch water. Fenced and cross fenced. This place is either suitable for stock grazing of all kinds or dairying. Can offer good proposition to right party. Address Peter Haack, 224 Byrne Building, Los Angeles, Cal.

FOR SALE
Perfectly equipped
propagating plant,
fine opening for an
all round man. Plenty
of deciduous and olive
budding.
Box 63, Rialto, Cal.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

RABBITS

For Sale—New Zealand Reds. No other rabbits raised on the Richey ranch, we have found out which are the best and most profitable, handsome and gentle. Breeding does, $4.00 and $5.00 each; bred to first prize buck. It pays to buy the best. Mrs. C. A. Richey, R. D. 8, Box 557, Los Angeles, Cal.

FARM LANDS FOR SALE.

Over Two Hundred persons have bought land in the last [illegible], [illegible] that I searched out from the state records. Many of them have [illegible], sent or ten dollars per tract to pay for [illegible]. Quite a number bought more than one tract of land. Some have sold much more quickly and at larger profits than they expected. One man sold the same day at a profit of $500, another man [illegible] at a profit of over $7000 in thirty days. If desired we will give you the names and addresses of [illegible] who have sold at a profit of 700 per cent who have purchased land through my service. Possibly if we get acquainted we would do business that would be profitable to all concerned.

First I am not a dealer; not an agent, not a locator. I am a searcher of records, commissioner of deeds, and candidate for state office on the Progressive ticket, subject to the wishes of those registered as Progressives at the primaries August 25th; have been interested in surveying and improving land in many counties—from Los Angeles to Shasta —from the coast to Nevada. I have searched state records for over twenty years, and have made a specialty of this work for more than four years. Those I have worked for say I am better informed along these lines than any other person they have met in the state. I have served on important appointments for the federal government. My ambition is to serve one term and get all the state lands in the hands of the people who will improve them, thus adding millions to the school fund, and giving the land to those who want it, and reducing the taxes of the people. I am the only candidate who states he will perform all he promises, or invites the recall.

At present I am manager of the CALIFORNIA STATE LAND INFORMATION BUREAU, and giving out information as per offer in free booklet. I ask a payment with order of $5.00, which helps to pay advertising expenses for my work. I trust you to pay me $10.00 after you get land on record in your name and all is satisfactory. If elected to office I will receive a salary and not fees. One of my promises is: "I will get out and help survey some grants and help homeseekers get land that does not belong to grants." WE NEED A CHANGE. "Your right to hire gives you the right to fire." If I don't do as I promise, fire me by the recall.

If you want the result of years of searching until 1915, send in $5.00 by personal check or any way convenient, and promise to pay $10.00 after you buy any sized tract of land. No trouble to answer questions. Write me fully with your order or any time. Joseph Clark, Manager, CALIFORNIA STATE LAND INFORMATION BUREAU, 1511 K St., SACRAMENTO, CALIFORNIA.

VICTORIA, AUSTRALIA, WANTS SETTLERS

Special inducements; government land, railways; free schools; cheap irrigation; 31 years to pay for farms adapted to alfalfa corn, grains, fruit, etc.; climate like California, ample markets; reduced passages, special excursion next November. Free particulars from F. T. A. FRICKE, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

For Sale—Better Than Lease—160 to 1600 acres of fine sub-irrigated river bottom land suitable for beets, beans, rice, grain and vegetables. Near large city. Good markets and cheap transportation. Will sell for $200.00 per acre, 5 per cent cash and 5 per cent each year until principal is fully paid. C. H. Barlow, 111 So. Broadway, Los Angeles, Cal.

For Sale—Best paying alfalfa ranch in the beautiful Santa Clara Valley, one-half mile from R. R. station 18 acres alfalfa, 2 acres family orchard; beautiful residence, outhouses and irrigating plant. Address W. Kiely, Lawrence, Cal.

For Sale—Ten acres, fruit ranch, trees two and four years old; seven acres of apples and three acres peaches, cherries, pears, plums. Price $6,000, half cash, balance on time at 6 per cent. F. W. Duncombe, R. F. D. 1, Beaumont, Cal.

For Sale—160 acres unimproved land 3 miles from Anderson. Some timber and underbrush. Can be irrigated from canal. Red clay loam, suitable for olives and fruits. Price $12.00 per acre. Anderson Realty Co., Anderson, California.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

Ranches, homes, acres, lots, exchange; send for free list. Wilson Bros., Santa Cruz.

POULTRY

How to Make Money—Mrs. A. Basley's latest Poultry Book is without exception the best ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1. Order from Cultivator Publishing Co.

For Sale or Exchange—Wanted, 100 pullets, Plymouth Rocks, R. I. Reds or Orpingtons, to feed my Burbank Spineless cactus to. You want the cactus, I want the chicks. 50c slabs for 50c pullets. Address or ship to H. L. Bauers Cactus Ranch, 4401 Hummell St., Los Angeles, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., successors to Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

Barred Rock Cockerels (Hawkins' Royal Blue Strain) ready for fall mating. All the popular breeds of baby chicks every week after Aug. 15th. Order early and avoid the rush. Enoch Crews, R. 1, Santa Cruz, Cal.

For Sale—Japanese Silkie—$5.00 for trio. Cockerels, $2.00 each until sold. These are the thoroughbred White Silkies, with feathers on their legs; fine pets. J. H. Brohaska, R. F. D. 57 A, Chula Vista, Cal.

Baby Chicks—White Leghorns, McFarland strain, Barred Rocks and R. I. Reds. Ship anywhere and guarantee safe arrival. J. W. Lyon, R. D. 1, Box 170, Gardena, Cal.

Barred Plymouth Rocks — "None better." Special prices for May and June. Write for 'em. C. H. Vodden, Los Gatos, Cal.

SEEDS AND PLANTS

Grow Sudan Grass — The new forage crop — endures drouth, yields heavy, excellent in feeding value. Plants rogued and seed personally inspected by experiment station officials. The supply this year is limited. Seed one dollar per pound. B. D. Short, Rhome, Tex.

For Sale—Avocado Seeds (Alligator Pear) at $4.00 a 100; $35.00 a 1000. I also have to offer a few small yearling Avocado trees at $10.00 a 100. J. B. Wagner, Nurseryman, Pasadena, Cal.

$ $ $ SpineleSS Cactu$—All varieties Burbank's fruiting and forage plants, 10c up. Plant now. Booklet free. Wonderful new Giant Rhubarb. Black Bros.' Nursery, 455 Lucas, Los Angeles. $ $ $ $ $ $ $ $ $

Thornless Cactus Slabs for sale at 5 to 15 cents each. Chas. R. Hanna, R. D. No. 3, Riverside, Cal.

BEES

It pays to keep bees on the farm, raise your own honey, make considerable profit besides. We can supply gentle Italian bees at 3.50 for five frame colony, five dollars for ten frames, and ship anywhere by express. Write for our free price list of bees, instruction books, etc. Spencer Apiaries Co., Box 14, Nordhoff, Cal.

LAUGH IT OFF

Are you worsted in a fight?
Laugh it off.
Are you cheated of your right?
Laugh it off.
Don't make tragedy of trifles,
Don't shoot butterflies with rifles—
Laugh it off.

Does your work get into kinks?
Laugh it off.
Are you near all sorts of brinks?
Laugh it off.
If it's sanity you're after,
There's no recipe like laughter-
Laugh it off.

—Eliot.

CANNING CORN ON AND OFF THE COB

The following seasonable recipes for the canning of corn have proven both practical and economical for the housewife. The recipes have been worked out in the department's canning kitchen and the products tested for nearly two years.

These recipes have been used in connection with the five different types of canning devices and the corn has been put up in all types of containers, such as glass top, screw top, suction top, and tin cans. The method employed is the cold-pack method, the same as is now being used in the best commercial factories of the world, instead of requiring the laborious and tedious method of fractional sterilization of an hour each day for three consecutive days and the lifting of the products in and out of the canning devices three times. The method now employed contemplates but one sterilization and turns out the product in better shape, with better color, texture, and flavor than the fractional sterilization method. By following these recipes and method the family can have corn, either on off the cob, throughout the year at a very reasonable expense of time, enery and money:

Corn Off the Cob.

Select sweet ears of uniform size and proper ripeness. If too ripe the corn will color while processing. (Processing is the canning term for sterilization or cooking). If not ripe enough much of the food value is lost in cutting the corn from the cob. Use either glass jars or tin cans. For market purposes and greater safety in transportation, use tin cans.

Remove husk, silk, shank, tips and injured or defective places. Blanch corn in boiling water or steam chest for from five to ten minutes. The time depends upon the stage of ripeness, size of ears and degree of freshness. Remove the ears and plunge quickly in cold water.

Cut the corn from the cob with a sharp, thin-bladed knife. Pack well in glass jar or tin can; add hot water and a level teaspoon of salt to the quart or No. 3 can. Place rubber and glass jar top in place, not tight. If using tin, solder cap in place and fill vent hole, or seal completely. Process the corn from 180 to 240 minutes in the home-made or hot water commercial bath outfits; for one and one-half hours in the water-seal outfits; for 60 minutes when using from five to ten pounds of steam pressure, with the steam pressure canning devices, and 40 minutes when using the aluminum steam pressure cooker outfit. After processing remove the jars, tighten covers, invert to test the joints and cool.

If using tin, inspect the soldered end caps for pin-hole leaks. Repair all leaks, allow to stand for 24 hours. If cans are still bulging at ends at the end of this time, one of two things is true—the pack is too full, or some live spores are still left in the can. If the latter, replace in sterilizer and process the second time from 30 minutes to one hour.

Canning Sweet Corn On the Cob.

Blanch in boiling water five to ten minutes, according to ripeness, size and freshness; plunge quickly in cold water. Pack, alternating butts and tips; add just a little boiling water and one level teaspoonful of salt to each quart. Place rubber and top and partially tighten. (Cap and tip tins.) Process 180 to 240 minutes in hot water bath; one and one-half hours water seal outfit; 60 minutes under five or more pounds of steam; 40 minutes in aluminum pressure cooker. Remove jars, tighten covers, invert and cool. (Heat up for table use in steamer, not in water. If corn seems flat or water-logged, it has been overcooked or allowed to stand in too much water.)

Use one or two quart glass jars if not needed for other products. Quart jars will hold two ears, two-quart jars will hold from three to five ears, according to size of ear. Do not can large ears. Half-gallon or gallon tin cans with large openings should be used in the canning of ear corn when idle glass jars are not available. Gallon tin cans will hold from six to twelve ears. They should be graded to uniform size.

In high altitudes, 4000 feet and over, it will be necessary to increase the time requirements in the canning of sweet corn about 25 per cent, if water boils at about 202 degrees Fahrenheit and even less.

The Jars

In the average home a large number of glass jars are idle every year. The use of these idle jars is recommended, but if hone are available, the most economical and practical containers are the half-gallon and the gallon tin can.

The gallon tin cans, including soldered-hemmed caps, will cost about six cents apiece, but they will hold six to twelve ears of corn, which is enough for a good-sized family. If the corn is removed from can and steamed for a few minutes, it cannot be distinguished from the sweet corn removed from the husk in midsummer. The corn can be heated in the container before opening to serve.

An ear of sweet corn on the average dining car and hotel a la carte service costs 25 cents. Considering this, canning corn on the cob for the market might prove a very profitable investment for a thrifty housekeeper and bring to her considerable pin-money.

One advantage of sweet corn canned on the cob over other canned corn, is that all the best food values are kept with the cob. In cutting corn off, the germ quality of the kernel, which keeps up its standard, is usually lost. This germ quality is the part of the corn that is sought by rats and mice when they look for food in the corn bin, and is the most vital part. Much of the corn is also rendered mushy when it is cut from the cob.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Ripe Pears
Cream of Wheat with Dates
Bread Scallops Frizzled Bacon
Coffee

Lunch or Supper

Sliced Cold Roast Beef Tomato Cakes
Cantaloupe Salad Rolls
Strawberry Shortcake Iced Tea

Dinner

Fricassed Steak Dumplings
Baked Sweet Potatoes
Creamed Summer Squash
Chilled Tomatoes, Cheese Dressing
Grape Pie Coffee

Tomato Cakes.

One cup canned or cooked tomatoes, two eggs, one dozen soda crackers rolled fine. Season the tomatoes and mash with half the crackers, add the eggs and beat smooth, add the rest of the crackers and form into small cakes. Drop on a hot buttered griddle and fry a nice brown.

Cantaloupe Salad.

Cut well chilled cantaloupes in halves lengthwise, take out the seeds and remove the pulp in nice even pieces, sprinkle lightly with salt and paprika, and add an equal quantity of crisp lettuce cut in strips. Garnish with boiled salad dressing made without oil or mustard. Place shells of cantaloupes on salad plates, garnish with large leaves of lettuce and fill with the salad. Serve at once while cool and crisp.

Bread Scallops.

Soak one teacup of bread crumbs in half a pint of milk, beat into them one large fresh egg, add half a cup of grated cheese, a tablespoon of melted butter and a grain or two of cayenne. Butter some patty-pans, sprinkle fine bread crumbs over them, then put a little of the mixture in each pan and sprinkle bread crumbs over the top. Bake for a quarter of an hour in a very hot oven and serve in the patty-pans.

Bread Cake.

Two cups bread spongs, two cups sugar, two eggs, one teaspoon lemon extract, one teaspoon cinnamon, one teaspoon allspice, one teaspoon nutmeg, one teaspoon soda dissolved in hot water, one-half teaspoon salt, one cup raisins, one-half cup melted butter, one and one-quarter cups flour. Mix and put in baking pan; set in warm place; let rise an hour and bake 45 minutes.

FREE HAND COOKING

The biggest 10 cents' worth I ever saw offered to the housekeeper is a small book of 36 pages, printed by the American School of Home Economics, 506 West 69th street, Chicago.

Its title is "Freehand Cooking On Scientific Principles." Its purpose is to give "the comparatively few fundamental recipes in cooking which are capable of infinite variation. Exact proportion, conditions and materials are essential to obtain identical results in cooking, but materials vary and conditions differ, so that it is often necessary to modify a recipe. By 'freehand cooking' is not meant hit or miss cooking, or cooking by guess, but the compounding of food materials on scientific principles—not following blindly by 'rule of thumb.'" And the scientific principles are stated clearly in the fewest possible words in very plain English. In fact the little book contains just the knowledge that is gained by a lifetime's experience of a "born" cook who is also a keen observer — and more.

It gives tables of weights and measures, cooking time-tables, thickening agents, leavening agents, shortening, flavoring and recipes.

From "Thickening Agents" we quote:

"The common thickening agents are flour, cornstarch, rice flour, potato flour, arrow root, eggs; also gelatin, sea moss, junket for milk and pectin of unripe fruits stiffen liquids on cooling.

"One level tablespoon of flour will thicken one cup of liquid for soups.

"Two level tablespoons of flour will thicken one cup of drippings or other liquid for gravies and sauces.

"Five level tablespoons of browned flour will thicken one cup of liquid for gravy.

"The thickening power of cornstarch is about twice that of flour.

"Two good sized eggs to one pint of milk make a custard—one egg to a cup for soft custard or baked cup custard; three eggs to a pint of milk for a large mold custard.

"One level tablespoon of granulated gelatin will stiffen about one pint of liquid, if cooled on ice."

From "Leavening":

"When eggs are used as leavening agents, the whites are beaten separately, as they will hold much more air than the yolks, and folded into the mixture the last thing, breaking as few air cells as possible. When air is depended on for a leavening agent, all materials are kept as cold as possible. Cold air expands more on heating than warm air. In pastry making heat also melts the fat so that the dough cannot be handled."

From "Shortening":

"Fats are added to doughs to make the product brittle—'short,' and to enrich the mixture. The fat counteracts the adhesive properties of the gluten and starch in flour.

"Pastry flours contain less gluten than bread flours and so require less shortening.

"Butter and oleomargarine contain about one-eighth water and salt, and thus have less shortening powers than lard, drippings, snowdrift, cottolene, etc., which contain no water."

These are only hints at the value of the book. Then there are pages of recipes. Send 10 cents to the address given above or to the Cultivator and you will receive this bulletin.

HOUSEHOLD QUERIES

Canning Green Peppers

Have lots of green peppers and have tried canning them the same as I do fruit by toasting the skins on ashes, then plunging in cold water and taking off the skins, after which I boil and can them, but they do not keep. Would like a good recipe for canning this vegetable. — Subscriber, Santa Maria.

Probably the peppers spoiled because they were not sufficiently sterilized by boiling. As a rule vegetables should be boiled hard for one hour on three successive days. They should be brought gradually to the boiling point and the 60 minutes should be counted after the boiling point has been reached. The bacterial life which causes spoiling of vegetables is not so easily killed as that which causes spoiling of fruits. In steam cookers where the temperature is maintained far above the boiling point, the process can be completed at one heating, but the three daily successive boilings are the only safe method to follow in the ordinary home canning. The Cultivator of July 2 had several instructive articles on canning of fruits and vegetables.

Cut open peppers, clean out seeds and cut in strips the size of a string bean. Pack into jars which have been rinsed in warm or cold water and cooled. Cover to the brim with salt water (one pound salt to seven gallons of water). Rinse cap in cold water and place on jar, but do not clasp or screw down, as the steam which forms inside must find an outlet. Use new rubbers. Place a board with holes in it or a few pieces of lath nailed crosswise in bottom of boiler. Set jars on this rack and pour water in, filling half way up on jars. Heat gradually to a boil, then boil for three hours. "Boiling" does not mean "simmering." Count time from the time water begins to boil and keep boiling steadily for one hour. Keep lid on boiler. Remove jars while boiling hot and set aside to cool. Do not set on a cold or wet surface or in a draft. Repeat this process the second and third days.

FOLDING DRESS SKIRTS.

To fold a dress skirt properly for packing and so avoid the crease down the middle of the front breadth, fasten the skirtband and pin the back to the middle of the band in front. Lay the skirt on a table or other flat surface, right side out, with the front breadth down. Smooth out all creases and lay folds flat. Then begin at the outer edges and roll each toward the center back until the two rolls meet. In this way the hang of the skirt is not injured, there are no wrinkles, and the front breadth is smooth and flat. If the skirt is too long for the trunk, fold it over near the top and place a roll of tissue paper under the fold.

THINK IT OUT.

Why is it that trained nurses are so attractive? I never saw an unattractive one, and some of them are "a joy forever." Is it health? Their study has taught them how to take care of themselves. Is it their immaculate costumes? Why shouldn't everybody be aseptically clean? Is it their mission which appeals to our sentiment? Why shouldn't everybody have a mission? After all, isn't that our real measure of beauty?—Delineator.

MIGHT EXPLAIN IT.

After spending the summer in a mountain hamlet in Tennessee the visitor hired a native to help pack up. As they were engaged in boxing a shelf of books the mountaineer remarked: "Somehow Ah never keered much foh books; but," he resumed after a thoughtful pause, "Ah can't read, an' mebbe that had sumpin' to do with it."

THE VALUE OF TIDINESS.

It has been said that women and girls who take pride in their personal appearance are at the very least one-fifth less in danger of infection by disease and are better able in the same proportion to successfully resist sickness than those that are untidy and careless.

It is not wise to stop the education of a boy or a girl with the body and to neglect the mind and the spirit. But we have done the equivalent of that in dealing with farm life. We have done more and have done it more effectively for the farmer along the line of better crops than any other nation. But we have done little and far less than many other nations for better business and better living on the farm.

"There are two sides to every argument," said the ready-made philosopher.

"Yes," replied the gloomy person, "but it makes a difference which side you choose. There are two sides to a piece of fly paper."—Washington Star.

Work is one of the best antidotes for blueness. Try it.

HAY

Under date of August 15 Scott, Magner & Miller say:

Receipts of hay for the past week, 4234 tons, the same as the previous week. Receipts of choice grades are light, and these are the only grades that are moving. Alfalfa conditions are about the same as grain hay. Shipments, however, are beginning to increase. Straw is offering from many points but demand for same is light.

We quote the average wholesale prices on carload lots of hay on today's market as follows:

Fancy Wheat Hay, lt. bales	11.00@12.00
No. 1 Wheat or Wheat and Oat	8.00@9.00
No. 2 Wheat or Wheat and Oat	6.00@7.50
Choice Tame Oat	10.00@11.00
Other Tame Oat	7.00@9.00
Barley	6.00@8.00
Wild Oat	6.00@8.00
Alfalfa	6.00@9.00
Stock Hay	4.50@5.00
Straw, new	40@45

Citrus Fruit Market

LOS ANGELES August 19, 1914.

The orange market has not dropped as severely as was feared a week ago, though the market is somewhat easier and no purchases made other than actual daily needs. The hope now is that no very serious slump will be made.

Lemons are still commanding abnormal prices. Receipts of foreigns have entirely ceased and the heavier picking of Californias will not begin until October. Until that time shipments from California will be exceedingly light.

Shipments.

Shipments of citrus fruit from Southern California points since November 1, 1913, are: Oranges, 35,065 cars; lemons, 2,576; total, 37,641; to same date last season, oranges, 12,614; lemons, 1,972; total, 14,586. Total shipments of all citrus fruits two years ago this date, 32,927 cars.

NEW YORK, Aug. 17.—Twenty cars Valencias sold, one mixed car. Market firm, prices slightly higher. Partly cloudy.

"FIRST AID" TO THE SICK HEN

(Continued from Page 179.)

gap, and the mass will be in plain sight.. With toothpicks, tweezers or similar tools take out the contents of the crop and make sure that there is nothing remaining to obstruct the out let to the organ. To close, take three or four stitches in the opening in the crop, making each stitch by itself and tying a knot that will not slip. Then do the same thing to the cut in the skin. For the stitches use white silk if possible, if not, No. 60 white cotton will do."

The list might be continued, but these are the most common diseases, and there are few other things an amateur is likely to be called on to treat Everyone who keeps poultry should have by him some poultry or doctor book giving symptoms and treatment of poultry diseases, and there is nothing better than Farmer's Bulletin 530 on "Important Poultry Diseases," which may be had for nothing by writing to Department of Agriculture, Washington.

The number of women who continue to hold wage-earning positions or practice a profession after they are married is now so large that an apartment house is already building in New York for the express requirements of the families to which they belong, says the Youth's Companion. It will contain about four hundred rooms, arranged in suites of one to four, with a bath. The staff of employees will include teachers and attendants to care for children; cooks, who will prepare the food in a central kitchen and send it up to the tenants in electric elevators; menders, to keep clothing in repair; and skilled laundresses. All of these conveniences the tenants will get at cost. Many applications for suites have already been received.

It will be news to many—for the act has attracted a curiously small amount of attention—that the British government has abolished prize money in the navy. It had done away with it in the army sometime before. The recent action, therefore, ends the chance of British soldiers and sailors to profit personally from the spoils of war. Private interest in pillage, spurred by liberal allowances of "grog," has written some dark chapters of history—and written them in blood. It was high time to write finis.

Lucky the cause, or the party, or the administration that has a good, lively opposition. In government and in reform, in life generally, what comes easily is likely to come ill. Where every inch must be fought for, it will usually be worth gaining. Where every clause of every measure is contested, the finished product may stand wear. The world seldom appreciates what it owes to beaten contestants, but the truth is that they carry nearly half the load.

Speaking of health—most people don't need constitution as much as they need by-laws.

It isn't all in knowing how to swim —it's swimming that counts.

RURAL SCHOOL GROUNDS

(Continued from Page 177.)

10 years land values in one such district have, to the positive knowledge of the writer, risen from $175 to $3000 per acre, for it was offered to me at the former price and I saw it sold for the latter sum. The Committee for the Beautification of Los Angeles County in 1915 is willing to send expert advisers, free of cost, to tell you how best, at the lowest cost, to improve and beautify your local schoolgrounds. To encourage every community they are offering $7000 in cash prizes for the most and best improvement shown from the present to the end of 1915. This sum is so divided that competition is arranged in classes so that the humblest school stands equal chance with the grandest of winning a prize, and of equal amount. Is your school in the race If not, why not? The competition is still open. Get in line at once.

The Wrong Attitude.

Too many garden as though the main or central idea is to water, water, water. Some of our least successful growers of citrus fruits seem imbued with the same thoughts.

Irrigation or flooding or sprinkling is a special practice to be avoided if possible and reduced to a minimum at all times. 'He is the best helmsman, who uses the wheel the least," could be paraphased to fit our case. The first and most important duty of the grower of any crop is to render water as nearly unnecessary as is possible. So fit the soil and manipulate it that your plants will not need watering. This is not an easy task with acreage, but in a small garden it is not a hard problem. Introduce humus and stir the soil; stir it all the time, it cannot be overdone.

Never mind "burning up humus;' keep cultivating.

Children's Gardens.

In this era of school gardens, it is not enough to encourage gardening at school; every child should have an opportunity to garden at home. They should be allowed to grow whatever suits them best, and in the way that pleases them most. It really matters little what they grow or how they grow it, so long as they make an honest effort. "The attitude's the thing." Their interest in plants and gardens should be encouraged in every way possible. Therefore see that the child's garden contains good rich soil and that all necessary equipment and proper tools are available. Let them experiment all they wish to; they may discover some things of worth unknown to their parents.

Water Gardens.

Many who would like to have a water garden are deterred from the attempt through fear of instituting a mosquito hatchery. Mosquitoes lay their eggs upon the surface of still water and a few days later the water is full of the resultant "wigglers" or larvae. In ponds where goldfish are kept no adult mosquitoes are found for they never pass the larval stage, even in case eggs may reach the water. I have taken a cupful of water teeming with "wigglers," poured it into a bowl containing four goldfish and watched the latter dispose of about 50 of the former in a few moments.. Do not let fear of mosquitoes prevent the building of a water garden.

Formal Gardens.

Formal gardens are for the city rather than the country, but in either case, they must be in connection with other architecture—close to the house. In the country harmony with surroundings is a primary consideration, therefore, the front yard should not be given up to formality. At one side, or even in the rear, is a far better place for formality. If attractive broken topography or native shrubbery or any beauties or charms of nature would have to be destroyed to make room therefor, better leave out all thoughts of a formal garden. We cannot afford to sacrifice natural beauty for anything man could replace it with.

Japanese Gardens.

Those who would build Japanese gardens, should remember that the fundamental basis is absurdity. Aim to crowd into 50 or 100 feet square all the detail you may find in a rugged and varied landscape of five or ten acres, if plenty of stones are present. For remember, you cannot build a Japanese garden without stones. You may do without wistarieas, bamboos, bridges, pagodas, etc., etc., but stones and water must be present. The stones should not be of our round boulder type, if avoidable, nor should they be of granite, but of some more or less absorbent composition or base so that they become moss-covered or time-stained. It is not necessary to use numbers of expensive dwarf or distorted trees, or even plants native to Japan. In a public park, however, the exclusive use of Japanese vegetation has an educational value and an attraction which should not be ignored.

Japanese Vegetation.

In building Japanese gardens, the following list of plants may be used: aralias, azaleas, bamboos, camellias, chrysanthemums (a few only), dwarf flowering almonds, cherries, etc, ferns, grasses (for pond margins), lilies, lotus, mosses, nandinas, pines (stunted, distorted, or mutilated), and the necessary wistaria. Pines should dominate and flowers should be few, for Japanese gardens should undergo little change throughout the year.

Grow Gypsophila.

In place of ferns or filmy foliage, grow the spray-like Gypsophlia or "Baby's Breath" to mix with larger and coarser flowers. It is used by all florists, in all countries. It is peculiarly suitable for California in-asmuch as it will grow and bloom almost without use of water. In drouth-resistant plants it stands near the head of the list.

SHEEP ON THE SMALL RANCH

(Continued from Page 183.)

indicate that it would pay. Figures are given in these reports in such a way that the farmer may calculate for himself, using the needs for 100 pounds of grain with his knowledge of the price of barley and the selling price of the lambs. As to hay, alfalfa is the best that can be grown—nothing excels it for sheep. But it is not wise to pasture sheep in alfalfa because they are such close croppers, likewise, if allowed to run on alfalfa when it is green and luxuriant, they are subject to bloat.

About this time of the moon, or any other for that matter, the wise farmer will be on the lookout for a sleek, oily gentleman trying to sell him something that will make him rich in a hurry. It is also well to have a chainless man-devouring bull pup handy.—Farm, Stock and Home.

THE YUBA BALL TREAD TRACTOR

how is your farm equipped?

Mechanical equipment is a constant problem to the industrial manufacturer. To meet increased cost of raw materials and labor he must have machinery more powerful, compacter, less liable to break down, easier and cheaper to operate and maintain, and faster in completing each operation.

The farmer has the same problems and the same needs.

THE YUBA BALL TREAD TRACTOR

Horses are expensive as hauling power producers. With a tractor the cost becomes less. With a Yuba Ball Tread Tractor the cost is reduced to a minimum.

This booklet, entitled "The Yuba Ball Tread Tractor," explains how. The coupon, filled out, brings it.

—He Bought 440 Acres Of Milford Valley Land!

—read his conservative letter (below) to a friend in Imperial Valley.

The letter and picture of Mr. Austin are reproduced by permission.

F. J. AUSTIN, MOTORING OVER HIS LAND IN MILFORD VALLEY

Milford, Utah, Aug. 4, 1914.

Mr. William Belford,
Alamorio, Cal.

My Dear Sir:

I want to give you a true idea of the Milford Valley project. Looking out from the town of Milford toward the company's lands you see a mile of green, grassy land, pasturing cattle and horses. Beyond, rising abruptly 3500 feet, is a partially green mountain range, making the most pleasing new country that I ever saw. The soil is a rich, reddish loam, without rocks. It doesn't get hard when dry, nor sticky when wet.

As to the dam, it is about 1100 feet long, 300 feet wide at the base and about 68 feet high. A tunnel was blasted through the solid rock, the river turned through the tunnel, and the dam built across the river bed. They built three cement walls upon bedrock and filled in between the walls with wet dirt and rolled it down with a heavy roller. They have also protected the water side of the dam with a rock "rip-rap" two and one-half feet thick.

Several of the recent purchasers have a fine crop of oats growing on the new land already. also potatoes, which are looking good. Adjoining the lands of the project is land that has been farmed for forty years, and the crops are in excellent condition. I believe these people when they tell me that alfalfa runs five and six tons to the acre, oats 80 bushels and wheat 40 bushels. The fruit trees, cherries, apples, pears, peaches and plums, are loaded with fruit. I have never seen finer gardens anywhere. The price of all farm products here is high, and I think it will remain so, as a very limited amount of land here can be brought into cultivation. The old lands are now selling at $200 and up per acre (15 to 30 miles from the railroad) and I see no reason why the new lands, closer in, should not bring as much or more when under cultivation.

Yours very truly,
F. J. AUSTIN.

$30 an Acre on Main Line of Salt Lake R. R.

Water Right $70 per Share—12 Years' Time, if Desired

The above letter was written by a conservative ex-Imperial Valley farmer —a well-to-do man who was in a position to select any land he desired in the entire west. That Mr. Austin purchased 440 acres of Milford Valley lands **a short time after his arrival on the ground** is the greatest advertisement that could be desired for the project.

Write or call for illustrated booklet and all specific information. Special homeseekers' excursions Wednesdays and Saturdays at low rates from Los Angeles.

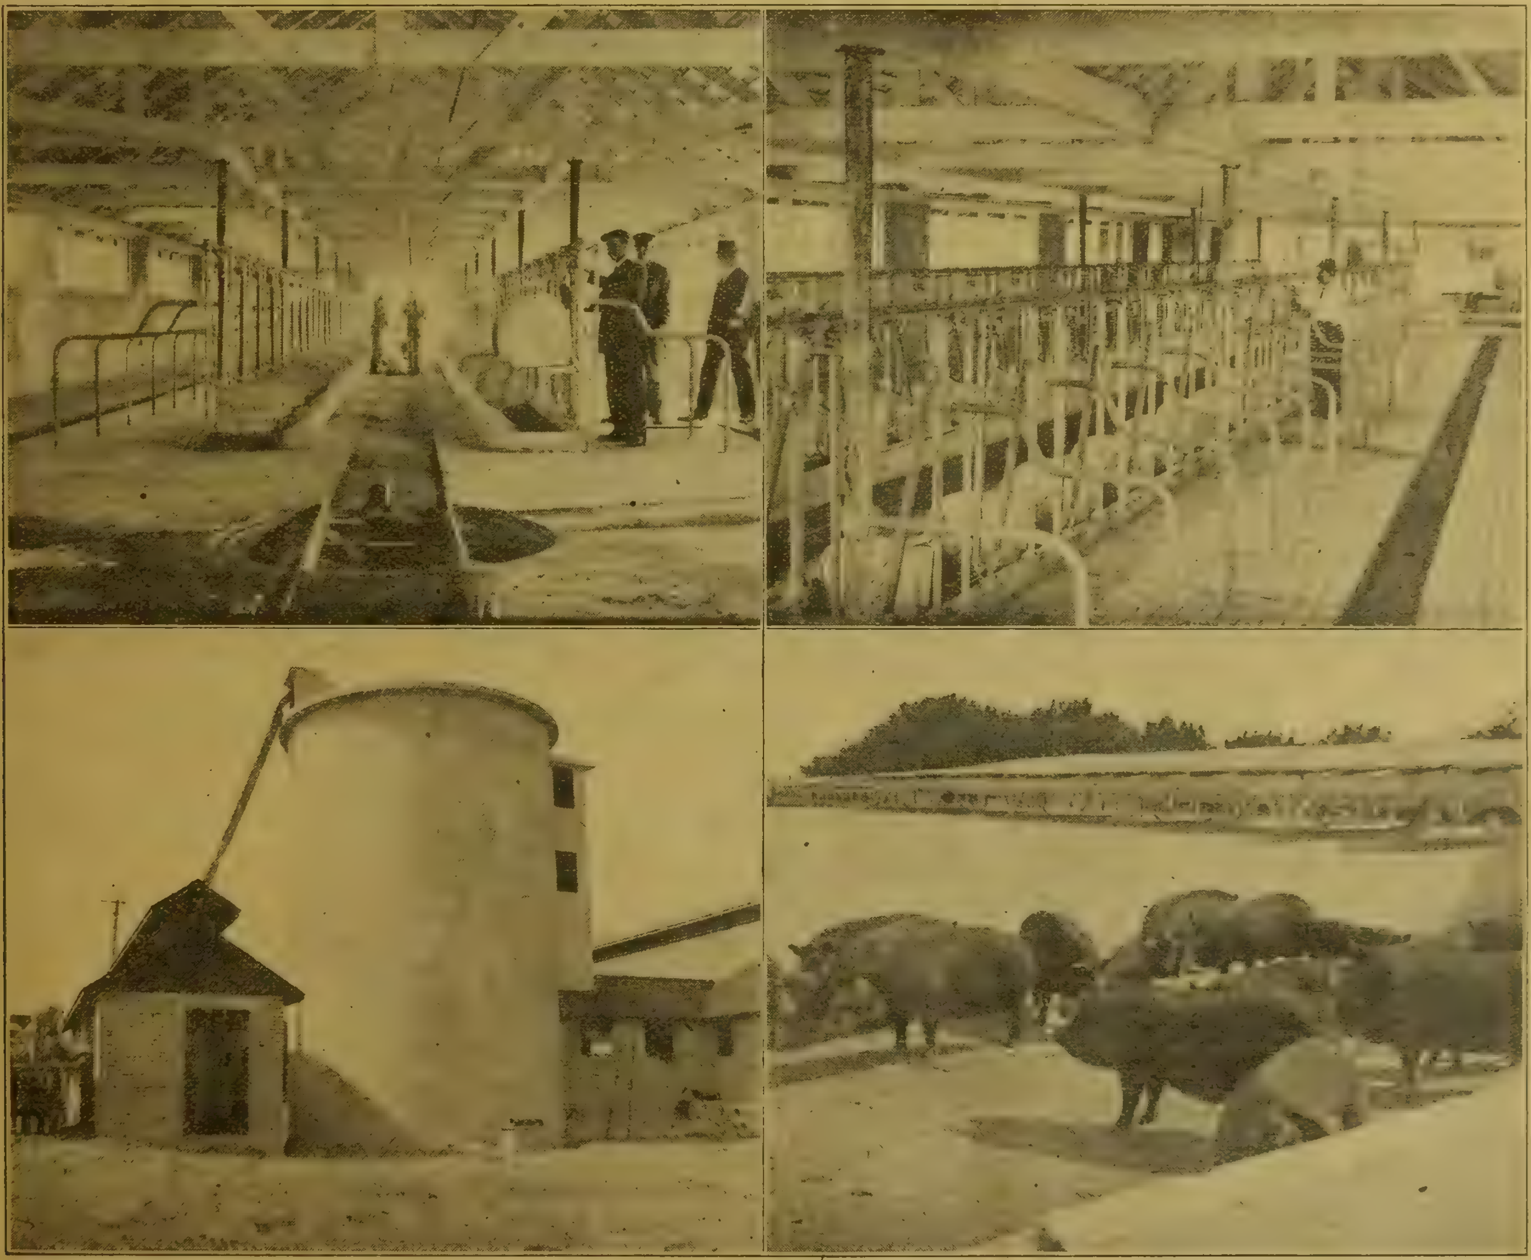
Fine Dairy Barn at Whittier



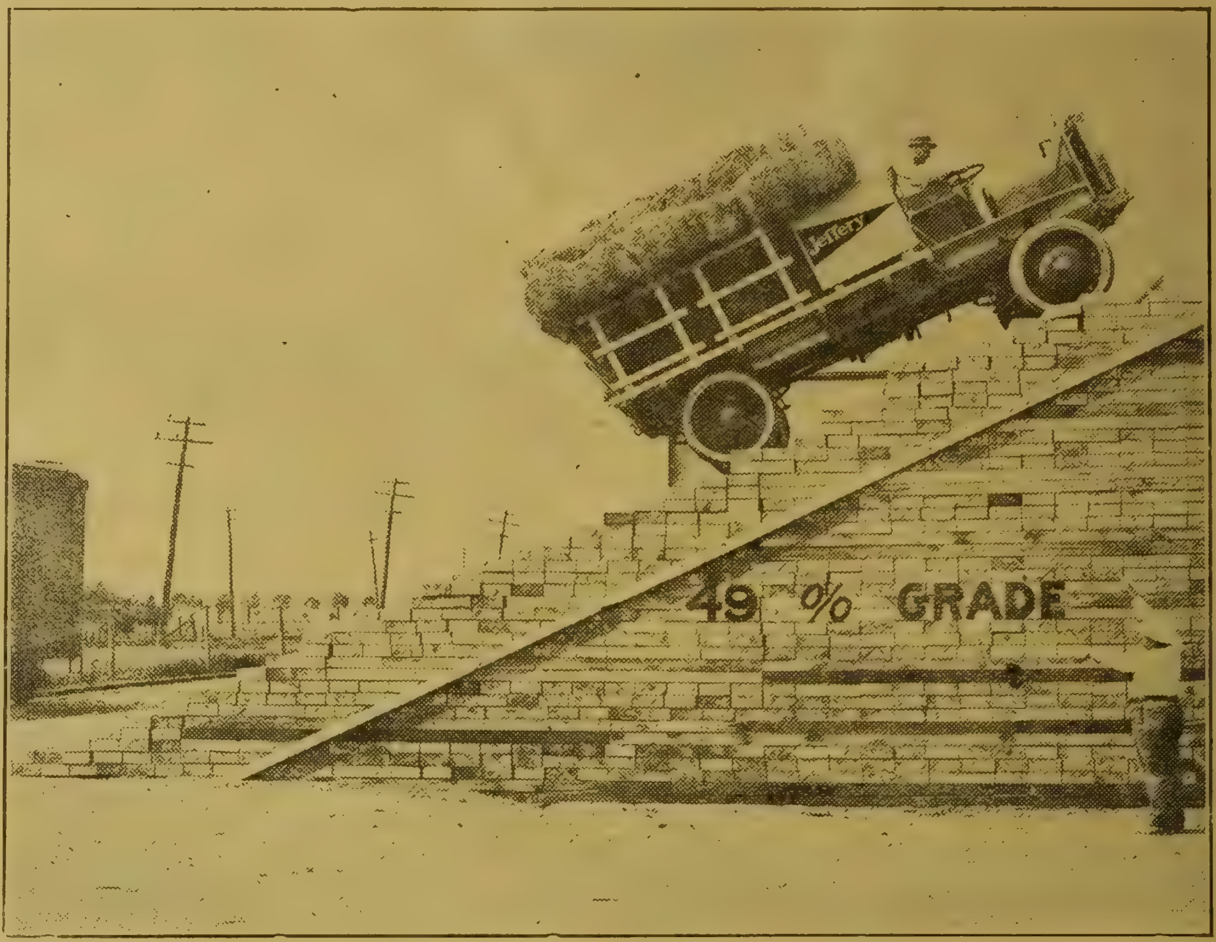
The state school has just installed a dairy barn which is a model as to economic labor possibilities. The first picture shows trackage with turntable; also construction of mangers. The upper picture at right shows up-to-date stanchions with gutter for flushing away refuse. The silo speaks for itself. The last picture shows the concrete hog pen with reinforced separating walls, so constructed that flushing is possible, the waste going to irrigating ditches and off to the fields.

The "Quad" Truck

Drives--Brakes--Steers--on all Four Wheels

Chassis $2950, Los Angeles

A Demonstration Will Convince



Seeing is Believing

The efficiency of all modern armies is based upon their mobility, and it is well known that animal-drawn transportation has been a serious drawback to the development of mobility. A motor truck can, under the most adverse conditions, cover a distance much greater than can be covered by any body of troops either mounted or on foot; furthermore, practical demonstration has shown that with careful handling, the cost of operating animal drawn vehicles is distinctly greater than that of the motor vehicle.

No truck has yet been developed, with the exception of the Jeffery Quadruple Drive, which could possible meet and conquer all bad road or other adverse conditions which inevitably confront troops in active service. The Jeffery Quad Truck does not need a road made for it as it is fully capable of making its own. It will operate over ploughed fields, and, provided with a holding bottom, it can cross a stream 34 inches in depth without flooding the carburetor. The inability to ford streams has previously been one of the greatest arguments against the adoption of the motor truck in the army or for farming purposes.

The truck can turn in a circle of 42 feet, has a clearance of 15¼ inches under the axles and 24 inches under the transmission. This excess clearance is of the greatest possible value for broken country and over rocky roads, through canyons and on stumpy ground. The Jeffery Quad Truck is designed to, and will actually in service, carry 4,000 pounds of dead load where four mules cannot drag the equivalent.

The Jeffery Quad Truck is not new. It has been in the service of the United States Army since September first, 1913, and on the roads and in test under the supervision of the Jeffery engineers for over a year and a half. It is the only truck now produced in America that is capable of hauling its capacity load, and a five ton trailer loaded to capacity, out of a cultivated orange orchard or a sandy alfalfa field. Space prohibits giving the specifications and all the uses of the Quad Truck. We would be glad to arrange a demonstration or mail catalog upon request.

The Thomas B. Jeffery Company, of Kenosha, Wis., who own and operate the largest factory in the United States building motor cars and trucks, that have a price range of from $1450.00 to $3000.00, have a plant covering 162 acres. The factory building is under glass, covering 26 acres. They are building a complete line of high grade, medium priced motor cars and trucks.

The Jeffery Four—the car that introduced the light weight, high speed, economical motor in America, selling at $1575; the new Chesterfield Light Six—the last word in Sixes, selling at $1775—Los Angeles; the Chesterfield Big Six—a comfortable, roomy up-to-date, seven passenger car—$2550—Los Angeles; the ¾-ton, 1-ton and 1½-ton trucks chassis, prices, Los Angeles, respectively, $1450, $1650 and $1800, with the different types of bodies—Roadster, Touring Car, All-weather Car, Sedan and Limousine—on the touring chassis, and the Open Express, Flare Board, combination Express and Stake, Platform Stake, Canopy Top, Wire Side, etc., on the truck chassis—make up this line of carefully produced, economical to operate, motor cars.

In future, we would strongly advise those contemplating the purchase of a motor car to get over the habit of judging quality by price. Get from some expert mechanic a statement of the things that a good car should have and then start out to find the car that has them, and, when you come to the Jeffery, you will be astonished at the quality, when you take the price into consideration.

It will give us much pleasure, upon request, to mail a catalog descriptive of our touring cars and roadsters.

Farming at a State School

The State School for Boys at Whittier Has Just Installed a Dairy Barn which may well be Called a Model in Efficiency and Construction. Practical Education Being Received by Boys, Which is Making Better Citizens

Not all California boys are born in the wholesome environment of farm life. Too many begin their training for life's work under conditions tending toward a life in which industry is not the principal factor, and sometimes these boys start or give indications, at least, that they will start in the wrong direction. These are sometimes placed in schools which are maintained by the state at Whittier in the southern end of the state or at Ione in the northern part.

It was our pleasure a few days ago to make a short inspection of some of the work being done by the boys at Whittier. The photos on the cover page of this issue give something of an idea of the practical work which they are permitted to do with practical, up-to-date appliances. At this school there are 150 attendants, and while the school feature is a prominent one, there is so much of real work that it has become more like a large farm home than a school. The boys are placed on their honor and inspired to take pride in their work. Some work on the farm, some in the printing office, some in the tailor or shoe shops, others engage in carpentry, gardening, floriculture, and various other callings. At the time of our visit the farmer boys were putting up silage. One of the photos shows the work in progress and the well constructed silo into which the corn is being lifted. Inside the silo were an even dozen boys engaged in tramping and packing. One of the interior views of the dairy barn shows the track leading from the silos to the turntable from which the car may be sent down between the rows of dairy cows or to the left to the stalls where the cows and calves are fed. The very latest in stanchions and manger appliances are used.

We take pleasure in referring to the dairy barn for the reason it is practical and did not cost as large a sum as some state buildings have. In fact the legislature made an appropriation of only $4000 for the building of the barn, silo and all. One administration of the school decided that the barn could not be built properly for such a sum and the money lay idle for some months. The necessity was so great, however, that Mr. Nellis, superintendent of the school, and Mr. Taylor, farmer, determined they would construct as much of a barn as they could. Sheds which were of no particular value on the farm were demolished and the second-hand roofs used in the construction of the new building. The foundation walls, floors and stanchions shown in the photographs are of very best construction, the silo is perfect in its appointments and arrangement, the accomodations for bulls and cows ready to calve are almost ideal, but economy marked the construction of the roof and upper structure, which may be replaced later if necessary. The entire structure cost less than $6000 and is a credit to those who planned it.

The dairy is stocked with pure bred Holsteins. There are about 30 cows in the milking string at the present time. The barn has a capacity of 48. The idea in using pure bred stock is that it is more profitable to the state to do so, as well as to the individual farmer. Males from producing strains are bringing to the state good prices, and Mr. Taylor informed us that almost every animal they have offered was quickly picked up.

A new feature in hog pens is shown in the photo on cover page. The fences between the various pens are of concrete, the entire floor is concrete, and in the center is a hog wallow or, more properly, a bathtub, with a shed running the entire length of the series of pens. Connected with each pen is another with sand bottom. The concrete pens can be flushed with water which is carried to the gutter at one side and off to irrigate field crops.

Productive Industry and the 8-Hour Bill

Address by Geo. W. Pierce at the Recent Fruit Growers Convention at Davis. The Bill Will be a Serious Handicap to all Farming Interests of California

California at the present time occupies a unique position. Through years of patient study and experimenting, the adaptability of our soil and climate to the production of an almost endless variety of fruit has been established beyond question. Intelligent planting coupled with expert care has brought the fruit output to such proportions that fruit is both abundant and cheap. Rich and poor alike revel in its enjoyment. The abundance, variety and excellence of our fruits have made California famous. Notwithstanding this, legislation is proposed at this time that if carried into effect will seriously handicap the fruit business.

If the fruit grower is to have so radical a departure from past and present customs injected into his business as is contemplated in the proposed universal eight-hour law, coupled with the possibilty later of the minimum wage scale, it is time to ask, "Is this the beginning of the end?"

The history of the California fruit industry has in it too many conspicuous failures, too many records of returns in red ink to warrant classing it in the list of over-lucrative occupations. If we are to have forced upon us a 75 per cent increase in the labor-cost of our products what compensating benefits are we offered? None. We were not considered, save as victims.

If this proposed law is what it purports to be, a measure for the benefit of the man who works for a wage, it is founded on a fallacious idea. It will kill the goose that lays the golden egg. it will put both employer and employee out of business. No efficient employee will be benefited by it. To force an inefficient employee on a grower, at a wage determined upon for an efficient workman is an imposition. It is unfair, un-American and degrading to the honest American wage earner.

Paternalism on the part of the government, to have any standing at all, should be founded on justice and equity. If minimum hours of labor and a minimum wage are to be established a measure defining minimum efficiency on the part of the laborer should also be established. Rate those unable to qualify as culls and let them market their labor for what it is worth. It is an injustice to the capable man to saddle upon him any part of the shortcomings of the drone. The mere fact that an animate thing bears the image of his creator is not the only credential he should be called upon to present, to qualify for a minimum wage. Wages should be based on efficiency and paid in proportion to the efficiency of the wage earner. Further, the employee should be held responsible for unnecessary loss occasioned by wilful negligence.

In effect the proposed measure will spell bankruptcy for the grower. Should any survive and produce fruit under the proposed conditions, to save themselves they would be forced to market their crop at a price so high that the demand would be small and the cost of selling heavy. Fruit would be a luxury. The demand for it would be greatly lessened. The state would be a party to the crippling of one of its leading industries. Fruit would be beyond the reach of the poorer classes. Forty-eight hours a week for the laborer in the orchards means forty-eight hours a week without fruit for the families of all laboring men. This is based on the assumption that the fruit industry is a legitimate and useful occupation, and that its annihilation would result in loss and discomfiture to the general public.

Few callings are as exacting as is the fruit industry at harvest time. The destiny of the financial outcome for the entire year is crowded into a few days. A surplus of efficient help at this time of year is never encountered. It is only by piece work, contract and other means that the grower is enabled to prevent heavy losses. Why handicap him further? If, in times of emergency and to save his crop, he pays his employees extra wages for overtime is it anybody's business save those of the contracting parties? It is safe to say that the orchard employee working by the day, who is overworked or who has suffered physically in the slightest degree is as hard to find as is the proverbial needle in the hay stack.

If we are to have an eight-hour day we should have eight-hour fruit. If forty-eight hours a week is all that men are to be permitted to work the fruit schedules of nature should be revised. Fruit should not be permitted to ripen save during forty-eight designated hours, during any one week. No doubt much valuable assistance in this work can be secured from the thoughful men who orginated the cause of our present alarm. If we are to accept as sound doctrine the theories of the walking delegate of the labor unions, we are forced to the conclusion that the Supreme Being, in creating fruit with its seven days a week ripening period, and the walking delegate with his forty-eight hour a week schedule, made at least one serious mistake.

Weather conditions, over which the grower can have no control, are leading factors in the ripening of fruit. At times the grower is rushed to pre-

Citrus and Tropical Fruits

CITRUS GROWING IN AUSTRALIA

By R. Wilkinson in Fruit World of Australia.

There can be no question as to the suitability of Australia for the production of citrus fruits. Who has not seen old orange, mandarin, and lemon trees growing under the most severe conditions, without cultivation, pruning or any manure, and yet bearing heavy crops of luscious golden fruit. It is a striking example of the adaptability of our soil and climate conditions when we find trees of the citrus family thriving from one end of the commonwealth to the other. In the semitropical districts of Queensland extending from Cooktown in the north to Nerang and Redland Bay in the south, and in a strip at least a hundred miles wide, oranges are grown commercially. The wild varieties of citrus found growing in the virgin scrubs are a further example of their adaptability there. In New South Wales the principal center of production is around Sydney, extending to Penrith in the west, but oranges are grown in a lesser degree all up the north coast. Even out in the arid western country at Pera Bore near Bourke, and at Wentworth on the River Darling, citrus fruits of perhaps the finest quality produced in the commonwealth are grown under irrigation. The opening up of the great irrigation scheme on the Murrumbidgee will no doubt see a large area of it planted to oranges, as the results obtained at the Yanco experiment farm indicate that the orange will be very profitable there. Victoria produces most of her oranges by irrigation at Mildura and Merbein, on the northern border, and the industry in the South Australian irrigation settlement of Renmark has been established for about a quarter of a century. Western Australia has not as yet resorted to irrigation methods to any great extent, yet citrus growing has been carried out very successfully at Harvey, the Darling ranges, and elsewhere under irrigation and ordinary rainfall conditions. Only recently reports have been published that very fine oranges have been produced in the very heart of Australia—the Macdonnell ranges—and so we have sufficient evidence that the orange and its allied fruits are absolutely at home under our climatic conditions.

It is doubtful whether any other country in the world can produce citrus fruit to such perfection, with less trouble and for a better market than a considerable portion of Australia. Among our competitors take California and Florida as an example, which countries to a certain extent, have similar climatic conditions to ours. Our soil is as good as theirs and very much cheaper, our trees come into bearing earlier and bear heavier crops, we are not subject to "freeze outs" as they are, and, greatest advantage of all, we have an enormously large market by virtue of our geographical position. We are able to place our fruit on the European markets when they are bare of fruit from all the other citrus producing countries, and also at a time of the year, the summer, when such luscious and health-giving fruit is in great demand. It is true that Florida, and to a less degree California, have proximity to the world's markets in their favor, but in the case of the latter, the freight to England and the continent is as much as from Sydney, owing to the long overland journey. Again, compared to the orange growing countries of the Mediterranean, we have the same advantage of being able to place our fruit in their off season, we can produce better fruit, have less pests, and require less artificial manure. They have cheaper but less skilled labor in their markets, but our advantages more than outweigh theirs. These few instances serve to show how favorably our conditions compare with those obtaining in the citrus producing countries north of the equator, and also show what a vast market we can command besides our own local one, which cannot be overtaken for some considerable time yet.

The planting of large areas of citrus fruits of the right class and under such conditions that only the best is produced, cannot but increase the demand for the fruit. The local markets may be overtaken, but we should not depend on that as our only outlet. It is certain that not until the export trade is properly established can we be sure of a continuous and profitable demand for our product. The apple growing industry was never in a satisfactory state till the export trade was commenced, and it will be the same with oranges. Small and irregular shipments do not encourage a steady demand, and the sooner we can send home regular shipments of high-class fruit, the sooner will the industry begin to pay us properly.

DESCRIPTION OF COCCUS CITRICOLA

We note in the Entomological News a description by Mr. Roy E. Campbell, Berkeley, of the new soft gray scale. It is a technical description and comparison of this particular pest with Coccus hesperidum and Coccus elongatus. In fact, this scale was confused for a long time with elongatus. The description is too long and technical to have interest for Cultivator readers but we may mention a bit of the history referred to by Mr. Campbell in which he says that this pest was first discovered in 1909 by student inspectors from Pomona college. It appeared to be somewhat different from the common Coccus hesperidum and was first identified as Coccus longulus, and later changed to Coccus elongatus, Sign.

As to the habitat and distribution, Mr. Campbell says:

"Habitat, as far as known, on the leaves and twigs of citrus trees only. The young scales settle mostly on the leaves and when about half-grown migrate to the small twigs. No scales have been found on twigs larger than one-half inch in diameter. When the insects are abundant, and such is usually the case, they are arranged on the twigs in a curiously imbricated manner which is quite characteristic. The infestations are largely confined to the lower half of the tree.

"Distributed in Pomona, Claremont, Ontario, Cucamonga, Colton, Highlands, Redlands and Riverside in Southern California; in Tulare and

—control Red Black Purple and other SCALE by spraying with ZENO

Proven by Experts to be the Most Efficient and Cheapest Method

ZENO *is more efficient than fumigation* because it controls ALL the insects controlled by fumigation at one-third the cost and is effective against four times at many citrus pests, such as Scale, Red Spider, Silver Mites, Black Fungus or Smut, Lichens and other fungus on the bark. It leaves the tree in a thoroughly renovated, clean, healthy condition.

ZENO *is not an experiment* but has been used for controling pests on Citrus and Olive trees for the past five years. It is being used by the largest and most progressive growers in Southern California.

ZENO *is a perfect chemical compound* containing no free materials. Is not caustic and is safe and easy to use. Requires no agitation, mixing instantly with water, and remains in a perfect emulsion without separating in any way.

THE DEAN IRIS GARDENS, Moneta, Cal.

Fresno Counties in the lower San Joaquin Valley and slight infestations in Sacramento, Yuba City and Marysville in the Sacramento Valley. It is very probable that the insect has existed in California for some time and has passed unnoticed or, what is more likely, has been confused with and identified as Coccus hesperidum Linn, which it closely resembles."

PLOWING UNDER

When it comes to plowing under green manure crops nothing quite equals a good sharp steel mold board plow. The writer once had occasion to put under rye that was very heavy and standing higher than the horses' backs. A 14-inch steel plow was used. A chain looped around the plow beam just above the mold board and caught just at the end of the doubletree behind the off horse forced practically all the material under, but where the rye was heaviest and most woody it would force the chain back and would prevent the covering of much of the heavy growth. To overcome this a piece of baling wire—always at hand in California—was attached to the chain just over the middle of the furrow. Its full length was then allowed to drag back underneath, the dirt falling into the furrow and the friction of the soil falling upon it pulled it taut and forced under the heaviest rye until the plowed ground looked as clear of any spears of grass as any land ever did. Many prefer disking and cutting the green manure into the surface soil, but nothing suits the writer so well as plowing under and plowing under deep.—M.

PROFITS FROM FUMIGATION

The Spaniard seems to be waking up to the necessity for up-to-date methods of fruit culture and in order to make his comparatively profitless olive grove produce a revenue has availed himself of the practice of fumigation. We have just seen a table showing the earnings of olive tree plantations in Toledo, Spain, which have been treated by fumigation. The table shows the production in 1911, 1912 and 1913. The 1911 and 1912 crops were produced without any fumigation or spraying of the trees. The 1913 crop was produced after the trees were fumigated. One grower who produced from 1157 trees 2000 kilos in 1911 and 1450 kilos in 1912 produced, after fumigation, 31,500 kilos. This orchard showed increased production by fumigation of 6286 pesetas, one little orchard of 200 trees showed an increase of 707 pesetas. Probably these trees were infested to a far greater extent than are trees in California. However, it is added evidence of the worth of clean trees.

BEWARE OF SHAVINGS AND SAWDUST

In our issue of August 13th, in which so much attention was given to humus-forming material, we gave warning as to the effect of using shavings and sawdust, especially those of redwood. In addition, we have the following from Mr. C. J. K. Jones, formerly an orange grower of Florida, for many years a grower in California and a scientific observer of citrus conditions:

"I beg to protest against your advice to use shavings and sawdust as a source of humus. These are apt to be infected with fungous diseases which can be transmitted to the roots of citrus as well as to roots of deciduous and other trees. I would not use shavings or sawdust on my groves if paid to do so."

Perhaps Mr. Jones did not notice that on page 148 we gave emphatic warning regarding the use of such materials. But we are glad to have the additional information.

POLLENIZING FEIJOA

Referring to pollenizing of the feijoa, regarding which a question was recently asked in the columns of the Cultivator, we have the following from

C. F. Franceschi

In a recent issue of the California Cultivator in your Question and Answer column I came across a question about the pollenization of feijoas. I have found through various experiences that the feijoa if grown in very fertile soil with lots of water and plenty of care vegetates extremely well but never sets fruits, while others under the hardest of conditions bear fruits. The remedy for the first mentioned condition is to prune back the plant rather severely in the winter and when it starts in to bloom to keep water away from it for a couple of months, then when fruits are well set to water it rather sparingly once a month till maturity of fruits.

MOST ANY TIME

A country road, trees, sky, summer homes, a lake in the distance. A steam-railway line crosses the road at right angles.

Enter, up the road, an automobile, well loaded and running at high speed.

Enter at the far right an express train.

Both automobile and train are rushing toward the crossing.

Owner of automobile to chauffeur: "Can you make it?"

The chauffeur, speeding up: "Sure I can make it!"

He don't.—Cleveland Plain Dealer.

No War Prices

On Goodyear Tires. All advances—due to doubled cost of rubber—were withdrawn on August 19th. This applies to dealers and consumers.

We have secured from abroad sufficient rubber at former prices to warrant this announcement. Goodyear prices are now everywhere the same as they were before the war.

Sturdier Tires

In These Four Ways Excelling All the Rest

The tires which rule in Tiredom now are Goodyear tires—by long odds.

After men have used four millions of them, they lead in prestige and in sales.

The only reason is that motorists—hundreds of thousands of them—have proved these the sturdiest tires. They use them and tell other men to use them.

Where They Excel

Back of that super-service lie four exclusive features. They are these:

Our No-Rim-Cut feature. Time has proved it the only satisfactory way to completely wipe out rim-cutting.

Our "On-Air" cure. This exclusive process costs us $1,500 daily, but it ends the chief cause of blow-outs.

Our rubber rivets. By a patent method, hundreds of these are formed in each tire to combat tread separation. They reduce this risk sixty per cent.

All-Weather treads—the matchless anti-skids. They are tough, double-thick and enduring. Resistless on wet roads with their deep, sharp grips; yet flat and smooth, so they run like a plain tread.

Upper Class Tires
How to Get Them

These things make Goodyears the upper class tires. No other maker employs them. And no other method combats one of these troubles in an equally efficient way.

These things mean safety, sturdiness and strength. They mean maximum mileage and minimum trouble.

When one tire gives them—and others don't—you should get the tire that does.

Any dealer will supply you if you say you want this tire. He will sell it to you at a price impossible were it not for our mammoth output.

It is up to you. Note again these extra features. Then ask some Goodyear user what it means to have such tires.

Find out why Goodyear leads.

The Western Gas Engine

Types and Sizes
from
4 to 180 H. P.

For Shop or Farm Use

the WESTERN is the cheapest operated engine to buy. Built in types and sizes for every conceivable need—the ideal engine for either light ranch or heavy irrigation work.

Reliability, simplicity, accessibility of parts and economy—those are the reasons the WESTERN is so popular. You will find the WESTERN on most of the up-to-date ranches where nothing but the best of equipment is used. If shrewd, discriminating buyers choose the WESTERN, why shouldn't you?

Write Today for Our Latest Illustrated Catalog. It Gives Full Particulars.

Western Gas Engine Corporation

One, two and three years old. Variety and quality guaranteed.

"The olive is the best paying fruit grown in California"

FRED L. BORUFF San Fernando, Cal.

Deciduous Fruit Culture

ALMONDS IN CALIFORNIA

Almonds are grown from the extreme northern to nearly the extreme southern end of the state and yet they are so exacting that there are very few localities in which they do best. It is impossible to give very accurate figures as to production of the various counties. We have, however, from Chief Deputy George P. Weldon, of the state horticultural commission, a few figures, which appear to be the most accurate of any yet issued. Rough estimates secured from various counties made it appear at first that there might be as high a production as 8000 tons but careful check of these figures reduces them to practically 3000 tons as the maximum.

On this point Mr. Weldon writes:

"In the J. K. Armsby report, issued, I believe, last January, the average production for the state of California for the past 16 years was 1968 tons, while the highest for any season was 3270. The figures for the various counties being so much lower than those that were given me by the county commissioners in most cases it did not seem desirable to publish them at the time."

Mr. Weldon's estimate in tons for a normal crop in the various counties is as follows:

Butte, 350; Colusa, 100; Contra Costa, 375; Lake, 25; Los Angeles, 75; Merced, 60; Riverside, 100; Sacramento, 375; San Joaquin, 500; Solano, 100; Sutter, 325; Stanislaus, 100; Tehama, 50; Yolo, 425; Yuba, 50, and total for state, 3010.

PHYLLOXERA.

By G. H. Adcock, Viticultural Station, Rutherglen, Victoria, Australia.

Viticulture, one of the most ancient, and, under reasonable cultural conditions, one of the most profitable branches of agriculture, is admirably adapted to a very extensive portion of our own and the sister states. Besides its remunerative character another important recommendation for this pursuit is that there are certain considerable areas of land, which though not well fitted for other branches of agriculture, yet lend themselves readily to profitable viticulture.

By the introduction of phylloxera into Victoria nearly 40 years ago this important industry received a temporary set-back from which it is now steadily recovering, thanks to reconstitution with American resistant vines.

In response to repeated requests for an account of this terrible scourge, the present article is submitted to readers of the Journal. Portions of it were read by invitation before the Australian Association for the Advancement of Science and other parts have appeared in departmental papers during a long period of personal investigations on this subject.

As is probably well known the insect is indigenous to North America, and was first scientifically described in 1854 by a talented entomologist (Mr. Asa Fitch), who had been deputed by the state authorities of New York to study insects in their relation to agriculture. During the course of his interesting investigations he noticed galls on the leaves of native vines. Examination disclosed the tiny but formidable insect (phylloxera vastatrix) whose ravages are now only too well known in all the viticultural countries of the world. It is allied to the well-known aphids or "plant-lice," none of which are indigenous to Australia. The losses caused by these little creatures are beyond computation.

In 1863 the pest had invaded the vineries of England where it wrought great havoc. About this time disquieting rumors of a very serious and deeply mysterious disease among vines in certain localities in France caused great uneasiness and anxiety among vignerons. In 1864 according to Laffiere phylloxera was definitely recognized there. Rooted vines had been imported from the United States, and the insects, or their eggs, had been unconsciously introduced with these importations during the years 1858 to 1862. The importers of these plants were naturally unaware of the presence of the mischievous insect and equally ignorant of the awful devastation it would cause in the vineyards. Those were the days when rural producers had not realized the risks of importing plants and seeds without the skilled supervision now found essential and provided for by legislation in almost every country.

Two infected spots were noticed at first in France, one near Garde, the other near Bordeaux. Like circles on the water these centres of infection gradually widened, taking year by year increased areas, till about 1880 the formidable invader had spread over the greater part of the south of France and commenced its irresistible advance toward the north. Four years later it was computed that two and a half million acres of vines had been destroyed. So rapid and thorough was the destruction that vine stumps became the chief supply of fuel in what had been formerly flourishing vine-growing districts. All methods were tried to exterminate the insect, but all were equally unavailing. In about a dozen years from its introduction phylloxera had spread over the chief wine-producing countries of Europe. Today there is hardly a viticultural country on the surface of the globe that has escaped infection.

In 1875 it was unintentionally introduced into Victoria. In that year a well-known nurseryman imported a number of the newest and choicest varieties of vines from an English firm. The superintendent who had charge of this firm's vinery at that time visited our state a few years later on a holiday. In relating his vine-growing experiences to an intimate friend of the writer the visitor unconsciously gave the solution of the mystery of the introduction of phylloxera. He stated that a few years previously the vines under his care "went off" in an inexplicable manner. Older vines became sickly. Young vines died in the pots. Propagation became difficult and finally impossible. Inquiries were carefully and diligently made. Searching investigation followed and eventually the dreaded phylloxera was discovered to have been the cause of the disaster. Just before these alarming symptoms showed themselves, and from this very vinery—then regarded as absolutely free from all traces of disease—novelties were imported, as already indicated, by a Victorian nurseryman. These plants were increased as rapidly as nature and the nurseryman's skill combined could multiply them. Plants and scions were distributed among a limited number of applicants. In every case where these were secured and planted the insect was subsequently found at the earliest official inspection. There is no reasonable doubt but that in this way the now almost ubiquitous insect was originally distributed in this state.

Among those who first secured some of these supposed viticultural desiderata was Mr. H. King, of the Fairview Nursery, Fyansford, near Geelong. On the 7th of November, 1877, this gentleman's attention was attracted to a couple of his vines that were not thriving like the rest. A careful examination of the roots revealed the cause in the dreaded phylloxera, then seen living for the first time in Victoria. A thorough inspection failed to discover the pest at that time to any extent in the vineyard. So rapidly, however, did it spread that, when the vines were uprooted some six months later it could be found all over. It is the invariable record of the advent of this pest to every new district. This first-infected vineyard was in every respect a model. The vines were in full vigorous growth. Neither attention nor skilled treatment was wanting. The produce had just secured for the proprietor the national prize for 100 bunches of wine grapes, 50 white and 50 black. The same vines, too, had at the previous vintage yielded 1100 gallons of excellent wine to the acre; thus amply refuting the statements hazarded at the time, and often repeated since, that the disease would only be found in neglected, worn-out, or uncultivated vineyards.

The following year (1878) found the infection widely spread throughout the Geelong district, as official reports and records of eradication show. Under legislative authority heroic measures were adopted in the hope of completely annihilating the pest. All vines within the qurantined area, which was very extensive, were ordered to be destroyed. Some of the writer's early recollections are of owners looking on, alternately frantic and morose with rage, while gangs of men employed by the government were busily engaged in uprooting the vineyards. Naturally some did not take the despoiling of their property quietly. More than once the workmen hurriedly sought the boundary fence, closely followed by the business end of a pitchfork or other weapon in the hands of an enraged owner of foreign nationality. Nor was the watch-dog wanting in valor on such exciting occasions. All vineyards—clean and infected alike—were destroyed. Practically every vine was uprooted in the vain hope of wiping out, at once and forever, the tiny but deadly foe of the vigneron. Those who stated, as many did at this time, that Victoria was now free from the pest, reckoned without their host.

Subsequently the insidious enemy invaded the Bendigo, Goulburn Valley, and Rutherglen districts. In the former locality, as at Geelong, the vineyards were sacrificed. The vines were uprooted and burned as a holocaust to the insatiable phylloxera, but without the desired effect.

The life history of this insect is remarkable and somewhat complicated. Owing to the great difficulties of observing so minute an insect of chiefly subterranean habits, the cycle was not so quickly discovered as would be the case with insects more readily observed. It may be here mentioned that another species lives on the oak, but this insect has not distinguished itself as the one we are discussing has done.

The eggs which tide the insects over the cold of winter are for this reason known as "winter-eggs." They are laid on the wood of the vine, particularly on the older wood. Probably they may have originally been also deposited on the younger canes, but as these are removed annually at pruning time and destroyed, the instinct to seek the more secure positions on the vine became hereditary. Cold of climates much more rigorous than our own does not impair the vitality of these eggs. They may be frozen without injury. The warmth of spring or early summer hatches them out. If the vine be of American origin the newly-hatched insects may form galls on the leaves. If on a vine known as European, then they descend to the roots where several generations—the parthenogenetic progeny of "laying mothers"—carry on their work of silent destruction. About the middle or towards the end of summer some of these subterranean forms begin to show signs of wing development. They are then known as "nymphs." This change is specially marked when they have exhausted their food supply by destroying the feeding roots of the vine. In original experiments conducted by the writer in 1904 it was proved that wing development could be hastened or retarded by cutting off, or allowing the food supply to remain. After several moults the wings become sufficiently developed. Their eyes, too, have been adjusted for life above ground. By this time the insects have arrived at the surface. Thence they fly, and are carried in the direction of the prevailing winds to set up new colonies of infection in the same or an adjoining vineyard.

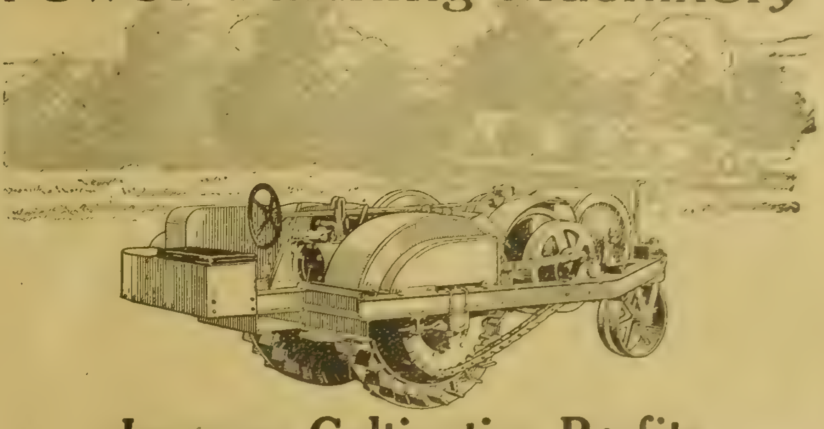
Having reached a suitable spot these winged migrants lay eggs on the vine selected for the purpose. These eggs differ distinctly in size. From the larger females are produced, while the smaller give rise to the male. This is the first appearance in the cycle of the sexes. These insects have their organs of nutrition undeveloped. They pair, and the result of the union is the fertilization of the winter-egg already described. The tiny male insect immediately dies. His partner only survives him till the important function of egg- laying has been accomplished. We thus see that in the life cycle of phylloxera we have what may be termed an alternation of generations, and that the true sexual individuals are only developed in the last brood for the year. This is characteristic of the aphids. Beside those that thus migrate to other vines, a number of the root, or subterranean, form hibernate on the vine root awaiting warmer weather to begin their deadly work.

The effect of the puncture made by the insect's proboscis in the fine rootlets is to cause it to swell up and curve over in a peculiar manner. Frequently this injured rootlet assumes the shape of a bird's head, neck, and beak. Not only is plant food removed by these little robbers, but the puncture sets up a remarkable irritation that causes a kind of mortification of the tissues. A strange discoloration is characteristic of the larger roots attacked. To a skilled observer an abnormal crop is often the first indication of the attack of the vine. As if the plant were conscious that it cannot long survive it sets to work to make provision for the production of its seed, which is the natural way to secure the perpetuation of the species. New roots are rapidly thrown out, and the vine seems even more vigorous than ever. But it is only for a time. The unequal struggle cannot long be maintained. After vintage the leaves change color and fall early. Next season growth is stunted, and ere long the vine dies and the pest spreads farther afield.

When it was definitely decided that phylloxera had been introduced to Europe on some of the native American vines, some of the keener viticultural

(Continued on Page 215.)

RUMELY
Power Farming Machinery



Increase Cultivation Profits

Any orchard cultivation increases quality and quantity of yields, but a ToeHold tractor reduces cultivation costs, and so adds to profits. It is built on the coast to fill coast requirements.

Rumely ToeHold Tractor

Built low, narrow and light to work under limbs and close to trees. It is especially adapted for orchard and vineyard work, but will plow, haul and harvest too. Weighs 8,800 to 10,000 lbs. Height with limb shields only 5 ft. 3 inches. An air clarifier keeps the dirt out of the carbureter. It burns gasoline.

Ask for ToeHold catalog H31. A guide to bigger profits.

We have good stationary engines as well as good tractors. The Rumely-Falk burns kerosene and the Rumely-Olds gasoline. Every Rumely machine is backed by Rumely service—49 branches and 11,000 dealers. Supplies and parts without delay.

Books

This list of helpful, instructive and interesting books is prepared by us with the purpose of enabling the Cultivator readers to supply themselves at the lowest possible cost. The great value of many of these is so well known as to need no comment from us. Some of the new books which we have added to the list this year deserve special mention. "Co-Operation in Agriculture," by G. Harold Powell, should be in the hands of every producer of farm products. "Farm Sewage," by Santee, will aid many in solving a perplexing problem. "Farm Manures," by Thorne, is decidedly valuable. We state sincerely that no orchardist can afford to get along without "The Pruning Book," by Bailey. We have had much inquiry for a book on keeping farm accounts—we can supply a good one now. The imported book, "Insecticides, Fungicides and Weedkillers," by Bourcart, is a marvel of completeness. The rapidly increasing use of gasoline engines, automobiles and tractors by the farmers has demanded reliable treatises on these subjects. "The Gasoline Engine on the Farm," by Putnam, "The Modern Gasoline Automobile," by Page, and "Traction Farming and Traction Engineering" are exceptionally complete, well illustrated and easily understood. Don't overlook the "Cement Workers' Handbook"—it's "worth its weight in gold." Every book on this list has the endorsement of the California Cultivator.

The Ornamental Garden

PRUNING ROSES

Written for the California Cultivator

By Ernest Braunton.

Someone wisely remarked that the training of a child should begin with its grandparents. In pruning roses, we need not go back, relatively, so far, for we may safely begin with the generation in hand.

We should, however, begin some weeks before autumn pruning time by giving the bushes a rest. In my own garden, where the bushes have been established for at least five years, I have not watered one bed, containing 60 bushes, since July 1st. Had they been established but one year I should begin this period of denial about August 15th. Had they been planted two years, the first day of the latter month would have seen them having their farewell drink.

About the first day of October, not before, these roses will be pruned. A few days later, by reason of a heavy reduction of the top, the buds will begin to swell, and as new leaves will burst forth in another few days, it is quite evident to all that this spurt of life will call for the stimulus and support of a copious supply of water. No fertilizer need be given just yet as the rejuvenated plant is hardly vigorous enough to need it.

Now as to pruning: I first cut away the top one-half of the bushes to get this superfluous wood out of the way. Always aim to cut the largest and most vigorous canes just about a quarter-inch above a bud on the outer side of the cane; this will spread the future growth. Next cut out all dead wood, then all wood smaller than a lead pencil. Next, all canes that cross upright growths or shoot out at abnormal angles to the straight up-growing canes. Then, if many canes are left, cut away those in the center so as to leave a vase-like frame, circular in outline and hollow within. Aim to leave nothing but good strong canes; three may be enough, five may be better, but seven is plenty, even on a large strong bush.

Now you have a frame-work or foundation on which may be built a strong, vigorous bush capable of mighty performances, one from which you have a right to expect great things. During the resting period foliage may become yellow and drop, small and soft canes which should be cut away may have their bark shrivel, but do not become alarmed. Neither the life nor vigor of your bushes are in danger. Remember, too, that, strange as it may seem, you should cut back the weak-growing sorts very heavily, but the strong-growing ones only moderately, for the latter have been doing very well as they were, while it is evident the weaker ones are in need of drastic treatment which will leave all of the present root system to support much less of top growth. When all this is done, irrigate, fertilize, and cultivate, and keep on doing so. Irrigations should be frequent and and heavy, but fertilizations and cultivations should be frequent but light, though the first cultivation may be deep and thorough and the soil then covered heavily with coarse stable manure and left for the season. Choose for yourself.

Railroad Gardening.

Every railroad station and grounds in California should be a standing advertisement, during 1915, of the community in which they are situated. Just consider the value of such impressions as induce the following remarks: "What a lovely display of plants and flowers we saw at Blank. The climate and soil there seem to grow all sorts of plants in perfection." By cooperating with the railroal agent it is probable that the station and its surroundings may be made a zone of beauty and this may be true of the most humble rural jumping-off place. What better means, or really what other means, are possible in seeking to call the attention of the "through-tourist" to your city, town or community?

Color Schemes.

So many times have I been asked about color schemes and for list of specific colors that it is advisable to publish lists of flowering plants easily grown that may be depended on to blossom at varying periods throughout the year. Everyone should know enough of trees to select those, for many like the acacias are known to all. In bedding plants use: for white, candytuft, phlox, asters (annual and perennial), stocks, iris, pyrethrum, gladiolius, dahlias, geraniums, sweet alyssum, and zinnias. For pink use: phlox (annuals and perennials,) asters, stocks, gladiolus, and geraniums. For red: poppies, salvias, coxcomb, cannas, geraniums, and gladiolus. For yellows: California poppies, coreopsis, calliopsis, calendula, marigolds, sunflowers, day lilies, gladiolus, and gaillardias. In blue: iris, Canterbury bells, cornflower, larkspurs, columbines, veronica and stokesia. Some tall plants, as hollyhocks, for background, come in all colors.

High Prices for Seeds.

The present war in Europe may or may not last long enough seriously to affect the price of flower seeds, though the wholesale rate on some has already advanced. The amount of flower seeds used by the average planter is so small that war prices need give the individual but little concern. There are, however, certain grass and clover seeds that come from Germany on which a sharp advance is already reported. Of course vegetable seeds may be seriously affected. Better buy early of all seeds for even if war ceases at once, prices will be high for at least a year.

Handbook on Gardening.

The seedmen of Los Angeles ar to publish a handbook on gardenin for the use of school children, th various parts of which will be writte by experts in the trade. It will b distributed free to all schools an doubtless anyone may obtain a cop for the asking. It has not yet bee issued, though in another month or s it may be available for distributio All interested in gardening shoul secure a copy.

Summer Irrigation.

About this time of the year som trees and shrubs long established an of good size show by drooping leave and a look of general depression that they need water. It is not well to allow these to remain thirsty until rains come and I would advise keeping a sharp lookout and irrigating heavily all those showing signs of distress. From now on to winter they should be watered at least once each month.

Tree Men Meet.

Sometime in September all those vitally interested in street and highway planting and in beautifying all of our fair land will meet at the Hotel Glenwood in Riverside, the occasion being the semi-annual convention of the Arboricultural Association of Southern California. We are depending upon our veteran friend, J. H. Reed, for arrangement and provision of a program that will excel any heretofore "pulled off" in these parts. Let us all be there and help this noble work along.

The Hardy Laurustine.

The extreme hardiness and sufficiency of the Laurustine calls for admiration on the part of all Californians. A native of Europe and most popular in England, the latter an extremely damp climate, it nevertheless deports itself most wonderfully in our arid cline. During the present summer I have observed several of the shrubs where they have had no care, not even a drink of water, and they endure an unnatural lack of humidity without a signal of distress.

ORNAMENTALS AT FRESNO FAIR

Secretary Eberhart of the Fresno district fair writes regarding the coming fair, which will be held September 29-October 3, that the management is now promoting a genuine floral festival in connection with the fair. This department is in charge of W. S. Marshall and Ernest Braunton of Los Angeles has been chosen judge. Nurserymen and amateur plant lovers are being appealed to to make it a notable exhibit. Mr. Eberhart writes that he anticipates an attendance of from 10,000 to 20,000 people daily. .

General Agriculture

A BAD ALFALFA DISEASE

Complaint has been coming in to the Colorado Agricultural College from a number of localities, but especially from the Western Slope and the San Luis Valley, of injury of some kind to alfalfa fields. A trip made to the San Luis Valley fields showed that all or practically all were affected with stem blight, sometimes called black stem blight or black stem rot. This is not a new disease as damage was noted several years ago. Professor Sackett worked out the cause of the trouble and found it to be a bacterial disease that affected the stems. The disease does not seem to be virulent enough to gain entrance to the plants under ordinary conditions. Tender, rapidly growing alfalfa may be injured by frosts or hail. When the epidermis or plant skin is broken from these causes the disease usually gains entrance.

The disease when first contracted causes a sort of yellowish, watery appearance on the sides of the stems. It turns to a black color very soon. It is usually noticed that alfalfa suffering from this disease does not make the proper growth. The most efficient remedy is to mow the alfalfa immediately after hail or frost injury. If the disease is observed to be present the best remedy is to mow at once.

If allowed to go without mowing the disease is liable to creep down the stems into the crowns, finally killing the crown buds and root. Mowing at the proper time has been found to be a practical and efficient preventive.—Alvin Keyser, Colorado Experiment Station.

SUGAR

The question having come up as to the quality of beet sugar as compared with cane sugar in fruit preserving, we wrote to the state university for the latest in this matter and have the following from Professor W. T. Clarke: If given equal degrees of refinement, there is absolutely no difference between sugar produced from sugar cane and sugar produced from the beet. The mechanical composition of the two is identically the same, the crystalization form identical, and the refraction test is the same. I would emphasize this matter of refinement. If the beet sugar is impure, while the cane sugar contains no impurities, then differences would be noted in the results obtained when using the materials. The same would be true with the cane sugar impure and the beet sugar pure. Present day methods of refinement make it possible for manufacturers to produce sugar from the beet that is absolutely undistinguishable from either the purity point of view or from any other point of view from sugar produced from the cane. Tests of our own with sugars from the two sources, and of equal refinement, indicate that no difference is experienced when using them for jellies, preserves or general canning operations.

RICE EXPOSITION

For the first time in the history of the United States a rice exposition is to be given north of the Mason and Dixon line.

The significance of this announcement will be more fully appreciated when it is understood that California is fast taking rank as one of the most important rice producing states in the Union. To celebrate the third anniversary of the establishment of the industry here, the people of Butte County have planned an exposition to be given in Gridley on September 3-6.

In the course of the three years the industry has assumed remarkably large proportions in California. Three years ago there was less than 50 acres planted to rice in Butte County. Today there are 15,000 acres planted to the cereal, and the value of the crop this year is estimated at $1,000,000. Preparations are already in progress for planting many additional acres next year, and it would not be surprising if the crop output were doubled.

At the exposition to be given in Gridley, which is officially known as "Butte County Rice Exposition," rice will be shown in its every stage from the seed that is planted in the ground to the various milled products.

Irrigation problems and problems connected with the harvesting and milling of the rice will be discussed by experts. The state dairying department is also taking a great interest in the exposition. One of the most interesting features of the big fair will be a dairy herd of 12 cows that have been and will be fed upon rice powders and rice straw fodder. Hand in hand with the development of rice fields there is going to be the development of a big dairy industry, for it has been found that rice straw forms an admirable fodder for cattle.

HOW ONE FARMER KEEPS ACCOUNTS

We know a farmer in the Sacramento valley who keeps a simple set of books that give him the same information about his business that a manufacturer has about the details of his. He pays everything by check and divides the amount of his monthly expenditures among as many cost factors as he wishes to keep an account of. Some of these are: Equipment, permanent improvements, cost of trees (for planting in orchard), care of trees, irrigation plant, cost of irrigating and crops. This last is kept in one lump account and other pages follow it with cost of separate crops segregated. Income is another account. A summary of all cost accounts corresponds with the checkbook account each month.

All of this is easy because of a simple, inexpensive loose leaf record book with index sheets. When an account makes more than one page another is slipped in. The financial history of the ranch from the time of beginning the system is shown at a glance, as is any other feature or item.

For instance, a glance at the hog account shows how much money has been spent for hogs — an inventory can be made on a line at any time—and this, with an estimate of the feed consumed, gives the returns from the hogs in a moment.

If these accounts had to be kept in the old kind of books it would, of course, be possible to keep them, but these little loose-leaf record books so simplify the matter that it makes it a job that is easy for a busy man to do and there is a fascination about knowing the standing of the various accounts each month that makes it a pleasure.

Alfalfa or heavy land in the Sacramento valley that was somewhat uneven during the first year after seeding, is thickening up in many places this year and the growth is uniform all over the field. The spots where the alfalfa did not grow so well at first are "heavier," or contain more clay than the balance of the field, and the roots and rootlets of the plants do not penetrate it so readily. An alfalfa root, however, is one of the greatest "soil openers" known to agriculture, and if the plant can keep alive it will gradually "conquer" a very hard soil. In this good work that alfalfa is so willing to do if it has the opportunity, it pays to give it every possible aid, such as a mulch of manure or straw to hold the moisture or the application of lime to make the soil more mellow.

Electricity can be used for running all kinds of stationary farm machinery —for pumping water, grinding feed, cutting fodder, filling silos, sawing wood, running the cream separator, grindstone, washing machine, etc. Where electricity is available, you merely turn the switch and the machine starts. When through using it you pull the switch and the machine stops, likewise the expense for current.

It pays to do a man's work. It pays to study throughtfully one's occupation and system of farming so as to obtain the greatest enjoyment, as well as the greatest possible revenue from it. But these farmers are doing a man's work. They are not doing the work of a horse or a machine. Brute or mechanical force can never equal in results the thought and energy of the man who uses his head.

Osborne Spring Tooth Harrows
Made in one, two or three section, 7 to 35 teeth, walking or riding. Special Alfalfa Teeth if wanted. Write for complete catalogue of this and all other harrows.
ARNOTT & COMPANY
118 South Los Angeles St. Los Angeles

SAVE MONEY on Irrigation Pipe

"AMERICAN" Surface Irrigation Pipe is the most economical pipe to buy. It is made of HEAVIER GALVANIZED SHEET STEEL than any other pipe, and is sold CHEAPER IN PROPORTION to quality and workmanship than any other pipe. It has NO RIVETS to pull out, but is made with the DOUBLE-LOCKED, TURNED AND SOLDERED SEAM, which is the strongest made, and CANNOT LEAK, even though the pipe be SMASHED FLAT. "AMERICAN" pipe will outlast any other and is by far the most ECONOMICAL to buy. Don't buy any irrigation pipe without getting our catalog, which explains fully the GREAT SUPERIORITY of "AMERICAN" Pipe. Remember, also, the service of our IRRIGATION ENGINEERS is FREE.

American Steel Pipe & Tank Co., 354-55-56 P. E. Bldg. LOS ANGELES
BRANCH—1228 "H" STREET, FRESNO.

Humus

The use of cover crops as a fertilizer and a means of adding humus to the soil has become established among the most progressive orchardists. The value of legumes in adding available nitrogen to the land is recognized in every line of husbandry, and the fruit grower has found the addition of humus a great saving in irrigation.

Fenugreek

Vetches, Burr Clover, Melilotus Clover are all highly productive of humus and nitrogen in soil. Fenugreek makes an especially dense growth and grows to excellent advantage in heavier and poorer soils.

Nitrogen

Hand in hand with the increasing use of cover crops has come the development of the nitrogen gathering bacteria, which has reached its highest point of commercial success in "Farmogerm," a high bred culture of bacteria, preserved in containers that admit air, yet prevent the admission of destroying germs.

Farmogerm

This product is most easily applied to the seed before planting, the result being an enormous increase in the foliage and nitrogen nodules of the crop. Many planters report an increase of three hundred per cent in tonnage, which is all returned to the soil through the decomposition of the plant. Write Dept. C for special literature and expert advice free.

BYRON JACKSON IRON WORKS

Stand at the Head as Builders of

High Grade Irrigation Pumps

It is the most efficient pump of this type on the market and the simplest in construction; saves you money, time and worry, and we know you consider this of some consequence and worth while. Write for information and new bulletin showing new construction. We can furnish this pump direct connected to motor or for belt drive. Which will you have?

The BYRON JACKSON IRON WORKS are the oldest and largest builders of Centrifugal and Turbine Pumps on the Pacific Coast.

Our Jackson Catalog No. 48-C is free. Send for one.

Deep We'l Vertical Motor Driven Turbine Pump

BYRON JACKSON IRON WORKS

357-361 Market Street, San Francisco, Cal.

Los Angeles 212 No. Los Angeles St. Works: West Berkeley, Cal.

Wholesale **ALFALFA SEED** Retail

Ready for Delivery September 15th

Famous YOLO and COLUSA County Alfalfa Seed. ABSOLUTELY GUARANTEED, against NOXIOUS WEEDS; and for GERMINATION. We advise ordering early. Every indication points to a sharp advance before Jan. 1st. We will accept a deposit of 20 per cent to accompany order and place same at this time, to be delivered to you on or before Nov. 1st. Advice, prices and samples supplied on application.
Twenty-five years' experience in the culture of alfalfa; NUF SED.

V. A. Peterson Alfalfa Seed Company

Arbuckle, Colusa County, California

The only exclusive alfalfa seed dealers in the west.

THE LARGEST RETURNS FOR YOUR MONEY

proved by actual experience, are produced by NITRATE OF SODA; because Nitrate is always needed in our soils.

Send five cents for postage on free books, and state what crops you are growing.

THE EIGHT-HOUR BILL

(Continued from Page 195.)

vent loss. He cannot indefinitely increase his force on the moment, as there is no available supply from which to draw. He will not be permitted to work his crew more than forty-eight hours a week, no matter what wages he is willing to pay, for that cre whas been relegated to idleness while his crop has been legislated into loss. The ideas of the walking delegate, however, must be sustained. The weather conditions must be changed. Petitions should be circulated at once for an initiative to place before the electors of the state a proposition to regulate the working hours of the weather. They should be made to conform to the modern eight-hour schedule.

CALIFORNIA EIGHT-HOUR BILL

"An Act to amend the Penal Code by adding a new section thereto, to be numbered 393½, limiting the hours of labor of employes and providing a penalty for violations of the provisions of this Act.

"The People of the State of California do enact as follows:

"Any employer who shall require or permit, or who shall suffer or permit any overseer, superintendent, foreman or other agent of such employer, to require or permit any person in his employ to work more than eight hours in one day or more than 48 hours in one week, except in cases of extraordinary emergency caused by fire, flood or danger to life or property, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not less than $50 nor more than $500 or imprisoned in the county jail not less than 10 nor more than 90 days, or both so fined and imprisoned."

The measure under consideration is ill advised, as it abridges personal liberty, tends to remove incentive for individual development and retard material progress. It is ill-advised because of its inelastisity. No provision is suggested to meet emergencies, such as are encountered by the orchardist. It is based on theory, is impractical and against the best interests of the state. Its author ignored the interests of the California fruit grower. He ruthlessly set aside thoughts of a possible development in a promising horticultural field. Unwittingly he proposes measures against the best interests of the laboring man.

Fruit Grower Scores Socialist.

At a meeting of farmers of Orange County resolutions were endorsed unanimously urging every farmer of that county to work and vote against the eight-hour measure.

At the meeting a Mr. Williams, who is secretary of the state socialist organization, attempted to defend the measure. In a reply to his talk Mr. C. C. Chapman said:

"You have failed to answer or explain any of the important objections made here by our farmers, or to show that this law would not seriously injure all the people of California. Working conditions in California are the finest in existence in the world today, and if humanity anywhere should be satisfied, contented and happy, it is here. This law is proposed by a small minority on the false assumption that it will benefit the worker, but as a matter of fact it will injure the employe first and worst.

"Our workers in Orange County at present are satisfied, thrifty, healthful, industrious and intelligent. They are well paid, are anxious to aid in harvesting our crops and to make extra pay for overtime when conditions demand, which overtime this law forbids. They have respect for their duties, for their employers and for themselves. They will continue to be thus contented unless professional agitators go among them circulating falsehoods and fomenting discontent and hatred.

"You, Mr. Williams, should be ashamed of yourself to be in such a business. You are seeking to inflict a serious injury upon all the people of the state. You owe an apology to the people of California for foisting this outrageous proposition upon the ballot."

EIGHT-HOUR LAW

The state of Washington is also in the midst of an eight-hour campaign. Its proposed law is much less drastic than that of California; for instance, by its provisions farmers may, if necessity arises, work their help for ten hours, providing they pay one and a-half wages; other provisions also are more favorable. But as to the effect of that bill upon the agricultural industry of the state we quote from the Spokesman Review, published at Spokane:

"Officers of the farmer's union of Walla Walla, Columbia and Garfield Counties, condemning the eight-hour initiative measure, declare in their argument filed for publication with the secretary of state that it would be hard to imagine any legislation more hostile to the best interests of the farmer. The enactment of this measure," adds their protest, "means ruin to agricultural operations."

"This undoubtedly voices the convictions of an overwhelming majority of the farmers, fruit growers, live stock producers and dairymen of Washington. A blow more dangerous than initiative measure No. 13 was never aimed at the basic industries of any state.

"It seems mere platitude to say that the men and women who derive their support from the soil and feed the nation find it necessary now, as it has been in all ages, to adjust themselves and their labor to the seasons, the weather and the elements. They must plow when the soil is in condition and stop work when it is dry or frozen. They must seed with expedition, cultivate with industry and fight weeds in the growing season. They must harvest long hours when the crops ripen, and in emergencies, to save the product from damage or destruction, must even disregard the Sabbath. The work of threshing must be conducted with a constant eye on the weather instead of the clock, and the grain must be hauled over earth roads to the railroads when conditions are favorable.

"These necessities apply with still greater force to haying and orchard work, as every one must know who has knowledge of farm life and agricultural conditions. Yet notwithstanding these obvious and unrepealable facts in nature it is seriously proposed to deal with seasonal industries as though they could be carried on continuously and without elemental interference six days a week and 52 weeks in the year.

"This measure, if adopted, would

cinch, in the first instance, the farmer, and in the next instance the general population of Washington. If adopted and enforced it would diminish the state's productive capacity and leave it with less to market of grain, of live stock, of hay, of orchard products, of lumber and other forest commodities, of fish, of hops and every other product of the soil and waters. The yield would be cut down and a part of the diminished product would be destroyed by the elements.

"As a consequence business would be depressed, land values would depreciate, immigration and capital would be turned from the state's borders and the lot of the farmer made vastly more difficult.

"Labor, instead of benefiting from this proposed measure, would suffer most of all. Its opportunity to find employment would be impaired, not only in the industries directly affected, but all down the industrial and business line.

"These facts are so self-evident and undeniable that it is no wonder the farmers are lodging an emphatic protest."

Farm Economics

COUNTY AGRICULTURAL AGENTS

County agricultural agents are sometimes referred to as "county advisers." This implies a misunderstanding of the real work of the agent. Advisory work is a part of the agent's duties, but is a minor part. Farmers quite generally resent and refuse to support the county agent whose work is outlined to them primarily as that of an adviser. As we conceive of it, the county agricultural agent has about half a dozen principal functions.

(1) He studies the agriculture of the county to learn what is being done and what is worth while agriculturally in each part of it. This study includes farm, financial, and organization surveys.

(2) He gives the results of his studies to farmers, not in the way of advice, but as facts observed and conclusions drawn. This is done through the local press, lectures, institutes, circulars, short courses, and personal interviews.

(3) Based on these local studies and the ascertained needs of the county, clubs, associations, and the like are organized and the individuals solicited to undertake definite lines of agricultural improvement on their own farms. Organizations are formed for cooperative buying and marketing and the standardization of farm products.

(4) He coordinates all existing agricultural agencies within the county so that all may work unitedly and efficiently.

(5) He develops local leadership. The task of improving the agriculture of an entire county is so stupendous that the agent must be primarily an administrator. He must inspire and accept the help of voluntary assistants in work.

(6) He acts as the connecting line between the scientists of the research institutions of the state and nation and the farmer, presenting the results of investigations in such a way that the farmer can use them and calling attention of scientists to the local agricultural problems of the county and soliciting their assistance.

(7) He gives advice. This may relate to spraying, seed treatment, mixing fertilizers, combating insect pests, cultural practices, or other miscellaneous matters which are the stock in trade of every well informed agent. We place the giving of advice seventh on the list because in actually improving the agriculture of the county it is probably of least importance, though in point of time it may be the first work undertaken.—Farm Management Monthly.

BUILDING RURAL LIFE AND CITIZENSHIP

One of the interesting features of the program of the ninth international Dry Farming Congress at Wichita, Kansas, October 7-17, will be an address by a representative of the American Bankers' Association, Mr. Joseph Hirsch of Corpus Christi, Texas, who will speak on the subject, "Practical Cooperation Between Bankers and Farmers."

Mr. Hirsch has been designated by B. F. Harris of Champaign, Illinois, chairman of the agricultural commission of the American Bankers' Association, who is himself unable to attend.

Mr. Harris, in the Banker-Farmer, which he publishes, has written the following editorial on the subject of rural education and citizenship:

"Take care of the youth of the republic, and they will take care of the republic!

"It is a maxim of German statesmen that whatever you would have appear in the life of a people, you should put into the schools.

"Educate a boy and you train a man; educate a girl and you train a family.

"Spencer said, 'To prepare us for complete living is the function which education has to discharge.' Has this function been discharged—is it being discharged now?

"If the Banker-Farmer believed that it is being discharged in any large or adequate measure — and particularly in the elementary grades and in the country, it would not use its cover page for Dr. Eliot's strong statement, and devote much of its space to this paramount issue, placing better elementary schools as the foundation stone of the Banker-Farmer program.

The great constructive work we all urge is based on and can only come from education fitted to the needs of citizenship—it will solve the other problems.

"We must devote more attention to the largest number of children—irrespective of their location—who are in school for the shortest period. Only a fading fraction of all the children go to, or partly through the high schools, and a larger measure of aid and attention must be given to the lower grades.

"More facilities for the elementary education of the many who are limited thereto—yet not withholding any portion for the higher education of the few who furnish trained leadership, stimulus and idealism.

"As a fact, the poorest schools—many of which could be consolidated—and the poorest teachers—largely because underpaid—are in the country and villages.

"The country life commission reported these schools 'Largely responsible for ineffective farming, lack of ideals and the drift to town.'

"From principles of citizenship and equality, as well as because we want to build up rural life, we must not penalize the country boys and girls with a school a self-respecting town would not tolerate, but place them on the same footing in the grades with those in town and bring the schools to the highest point of efficiency.

"The foundation of our future citizenship is laid in the rural and elementary schools, where 85 per cent of the children get all their education, and not in the higher schools of learning. The higher the standard in these elementary schools the higher will be the type of our citizenship.

"Our youth are not educated until hands, head and heart are trained efficiently for their own maintenance and for the benefit of their fellows and the state.

"To learn more is to earn more and only the useful person is safe and sane. In education and scientific farming lies the hope of the nation—and we want more bankers, business men and thoughtful, earnest farmers to go on our school boards.

"What are you going to do to improve the situation?"

SAVES SCHOOLS $2,000,000

Two million dollars have been saved the state schools through a decision handed down yesterday in San Francisco by the court of appeals sustaining the contention of Surveyor-General W. S. Kingsbury in the lieu land suit brought by Fred W. Lake, affecting 500 claimants and 270,000 acres of California lands. These will be sold at public auction and the proceeds will go to the schools of California. The last lands auctioned brought $10.30 per acre, less the $1.25 due the government.

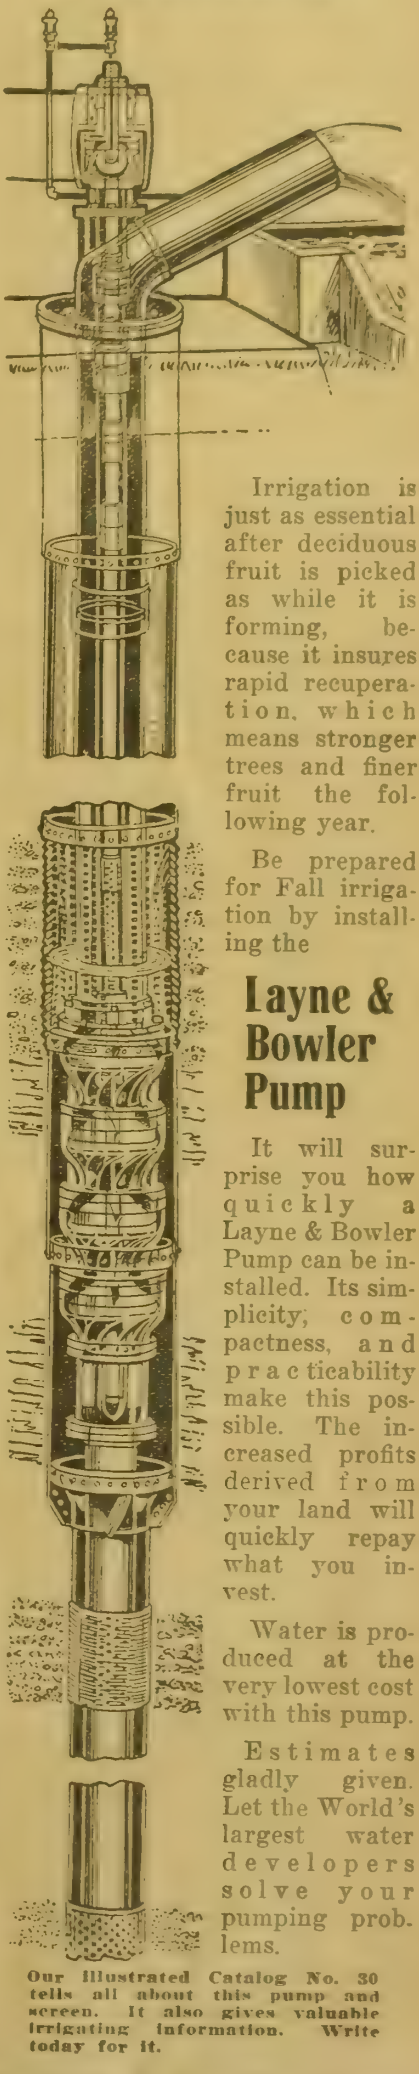
This case has been in the courts of the state since 1909, when Attorney-General U. S. Webb and Kingsbury secured the passage of the Thompson lieu land law which made it possible to throw such lands back on the market that they might revert to the benefit of the schools. — Sacramento Union.

(The Cultivator will add that it has no knowledge of the location of these lands or when they will be offered for sale. Doubtless announcement will be made by the surveyor-general at the proper time and place.)

FARM ADVISERS

There are now seven counties which have farm advisers and Mr. Crocheron, leader of this work in the state, sends the list as follows: San Joaquin County, Frank Lyons; Humboldt County, A. H. Christiansen; San Diego County, Jas. A. Armstrong; Yolo County, N. P. Searles; Napa County, H. J. Baade; Madera County, Thos. C. Mayhew; Ventura County, Wm. B. Parker; Alameda County, Walter Nixon; Kern County, Roland R. Mack.

The bureau of agriculture of the Philippines is to make a more serious attempt to restore the coffee industry of the islands. An experiment station has been maintained at Lipa in Batangas province for 10 years. This station has been trying to find a means of withstanding the ravages of pests which have destroyed practically all the coffee plants in the island.



Irrigate After Deciduous Fruit is Picked

Irrigation is just as essential after deciduous fruit is picked as while it is forming, because it insures rapid recuperation, which means stronger trees and finer fruit the following year.

Be prepared for Fall irrigation by installing the

Layne & Bowler Pump

It will surprise you how quickly a Layne & Bowler Pump can be installed. Its simplicity, compactness, and practicability make this possible. The increased profits derived from your land will quickly repay what you invest.

Water is produced at the very lowest cost with this pump.

Estimates gladly given. Let the World's largest water developers solve your pumping problems.

Our Illustrated Catalog No. 30 tells all about this pump and screen. It also gives valuable irrigating information. Write today for it.

NEUTRALITY

Appealing to the press of California to maintain a strictly neutral position regarding the war in Europe, the California Development Board sends information as to the people who make up our population. From the facts presented we gather that there are in this country 76,208 Germans, 17,330 Austrians, 3126 Hungarians, 161,671 British, 63,549 Italians, 20,470 French, 16,850 Russians and 1441 Belgians.

CALIFORNIA STATE FAIR

In referring to the California state fair we recently stated that E. J. Delorey was secretary of the association. This was an error, as we are informed by Mr. George Robertson of the state board of agriculture. He writes: "Mr. Delorey has been elected, or appointed, I should say, a director in place of Mr. Chas W. Paine, who has been appointed secretary in place of J. L. McCarthy, deceased."

IRRIGATION CONGRESS

The twenty-first international irrigation congress will convene in Calgary, October 5, and remain in session until and including October 9. A full list of committees has been appointed to make local arrangements, and in addition to the congress and discussions of the usual matters pertaining to irrigation there will be an exhibit of irrigated farm products. The secretary is Mr. Andrew Miller, Industrial Commission, Calgary, Alberta, Canada.

ADVERTISE OUR FRUITS

Florida orange producers are going to follow in the steps of California and do some extensive advertising of Florida oranges and grapefruit. She has seen the beneficial results of such an advertising campaign and wants her producers to receive liberal returns. We wish that other lines of California fruits would be advertised as is the citrus. Some have maintained that advertising adds to marketing expense; we would sooner say that it reduces advertising expense because of aiding through education in a marketing campaign, to say nothing of extending the markets, and, occasionally at least, bettering prices.

AMERICAN POMOLOGICAL

We are glad to know that the next meeting of the American Pomological Society will be held in Berkeley on September 2 and 3, 1915. We believe this is the first time the American Pomological has met on the Pacific coast, and we hope that California will be able to show the members of the society many fruit growing features which will be new to them. The itinerary is not yet arranged. The executive committee has in mind three different routes to the coast: One by the way of St. Louis, Los Angeles and Fresno; another by way of the canal, stopping at San Diego, thence by rail to San Francisco; another by way of the Northern or Union Pacific through Montana, Washington and Oregon. It is now thought that the Society for Horticultural Science, also the Pacific Coast Nurserymen's Association will meet at the same time.

MARKETING BY PARCEL POST

The parcel post may yet prove to be of as great benefit to the farmer as a marketing agency as it is as a carrier of merchandise. Experimental work is being done in ten centers where postmasters have been instructed to receive names of producers who are willing to sell produce direct to consumers. If this works out satisfactorily it may be the means of making Uncle Sam the biggest middleman in the world. Presumably this will call for emphatic protest on the part of the marketing trade, and perhaps justly, for we do not see how our trade can be conducted without some of the machinery which we now have. But certainly some step is necessary in order to secure more just treatment for the producers, and perhaps the parcel post will furnish the requisite club. The cities in which the experiment is being tried are: Boston, Atlanta, St. Louis, San Francisco, Baltimore, Detroit, Washington, Lacrosse, Lynn and Rock Island.

MORE POWER

Asked as to the effect of the proposed eight-hour law on the larger ranchers, the manager of one of the largest lemon producing properties in California has said: "The result will be that we will order more tractors and more electric motors and endeavor in every way to lessen the labor requirements. This will necessitate selling many animals and, of course, reducing the labor employed." The idea has been expressed by some of the smaller farmers that this bill, if it should become a law, will aid the small farmer who does the larger part of his work and give him a chance to keep up with the larger producer, but we believe that exactly the reverse will be the case. The larger producer with more capital at his command can adapt himself to the new conditions much more readily than the small farmer who will be unable to employ power to any great extent. He is the one who must employ extra labor at harvest time, and if he is prevented from meeting the conditions each season, he will suffer losses which will prove of most serious consequence.

THE EXPOSITION AND WAR

What effect the war will have on the exposition is the subject of serious discussion on the coast and, in fact, over the entire country. Plans have been made for the biggest ever, and it is most regrettable from a selfish standpoint, that the war should have broken out at this particular time. However, after discussing it from all sides, we believe the general feeling is that the effect will not be so serious as at first anticipated. On this point we have a letter from D. O. Lively, chief of the department of live stock, in which he says:

"The European war will make no change in the plans of the Panama-Pacific International Exposition. Of the 37 foreign nations that are taking part in the exposition, not to exceed five will be affected by the conflict of arms. It is not certain that this will apply to more than three. The exhibition palaces of the exposition are completed and exhibits are being installed. The states of the American Union are erecting their buildings. The gardens are planted and will be ready to bloom throughout the months of the exposition. The department of live stock will house as many exhibits as if there were no complications in Europe. Trade relations will be established with the countries of Central America, South America and with Japan and China. The total cash appropriations for prizes and transportation, amounting to $400,000, will be available. The exposition will be given within the dates originally fixed, February 20 to December 4, 1915."

Agricultural News Notes

Wilmington, Delaware, is the next meeting place of the National Grange Patrons of Husbandry, November 11-14.

Cooperative associations of agriculture are being formed in the Philippines by the government departments of agriculture and public instruction.

President Wilson has directed Attorney General McReynolds and Secretary Redfield of the department of commerce to investigate recent advances in prices of foodstuffs.

Demonstrations of use of hog cholera serum will be given at stock and county and state fairs in Wisconsin by the United States department of agriculture and the Wisconsin college of agriculture.

A Cairo correspondent writes that, owing to the falling of the Nile, Egypt will have to import nearly all her rice this year. The Nile has not been so low for nearly 100 years, and the facilities for water storage have been insufficient to relieve the distress.

Pre-cooling investigations have been carried on by the U. S. department of agriculture on apples, pears, peaches and small fruits in the eastern states; pomelos in Florida; oranges, lemons, apples, grapes and fresh figs in California, and apples and pears in Oregon and Washington.

Holland has sevefal large associations for promoting bulb culture. Consul Murphy of Amsterdam states that the General Bulb Culture Association has 3000 members divided into 37 branches; the Dutch Bulb Growers' Association, 1400 members, in 31 branches; and the Federation of Bulb Merchants, 200 members.

On July 1, 26 Siberian peasant farmers landed at Hull, England, to study British agricultural methods and cooperative systems, as delegates from what has been called the greatest cooperative farming society in the world. This society has built up an extensive butter trade with Great Britain. Between 30,000 and 40,000 long tons of Siberian butter are consumed in the United Kingdom annually, and Siberian eggs and cheese are likewise purchased in large quantities.

There are 36 fruit packing schools in British Columbia, which are rendering valuable service in the way of teaching the fruit growers of the province the most efficient and economical methods of packing. Many settlers in British Columbia had no knowledge of farming or fruit growing when they settled on the land, and the government realizes the necessity of primary instruction in the various branches of agriculture in order to assist them in making a success of their undertakings.

Some years ago a herd of Galloway cattle was taken to Alaska by the government. Two years ago the volcanic eruption of Mount Katmi covered the country for miles with lava and ruined the pasturage and other forage. It was necessary to bring these cattle back to the states, and they have been pastured in western Washington, south of Chehalis. Professor C. C. Georgeson, head of the four Alaska experiment stations, reports that by hard work and intensive seeding they have managed to grow a pretty good crop of hardy grass on the volcanic ash and now about 50 head of the Galloway cattle are on their way back to the northland.

Agricultural News Notes of the Pacific Coast

Northern California

Several Yolo County horses will trot at the state fair this fall.

Napa County farmers are fully organized in fighting the eight-hour law.

A large acreage of standing grain was burned over near Woodland, Yolo County.

Eldorado County has shipped over 100 cars of choice mountain pears to eastern markets.

Solano County supervisors have appropriated $2000 for expense of a farm adviser's office.

One orange grower at Fernley, Nevada County, claims ripe oranges for the middle of August.

The first meeting of directors of the Anderson-Cottonwood irrigation district was held last week.

Federal engineers are inspecting the Yuba and Feather rivers to devise methods of flood control.

The labor situation at Wheatland is still more or less strained. The I. W. W. is still maintaining a corps of picketers.

Glenn County supervisors have granted the request of many farmers to make appropriation for expenses of farm adviser's office.

One Red Bluff, Tehama County, blackberry grower claims to have produced $11.65 worth of berries on three vines which were planted three years.

The state highway between Davis and Woodland is showing some activity, and it is thought the big strings of workers will soon have a fine roadway connecting these two cities.

The California Canneries Company reports large shipments of canned fruit to Europe just prior to the outbreak of the war. Over 150,000 cases of these goods will go through the Panama Canal.

Red spider, or yellow mite, continues to be a pest in many Sacramento Valley orchards. Sulphur in some form of liquid or dust spray, will hold it in check, but it must be persistently followed up.

Eight-hour law discussion is a topic of more than usual interest in Northern California. Business men and farmers at Willows in Glenn County, are organizing to do everything in their power to defeat the measure.

The poultry association at Willows, Glenn County, will hold its next annual November 18 to 21. The Women's Improvement Club will unite with the poultry people and give at the same time a chrysanthemum show.

Sacramento Valley farmers, who have hay to feed, are finding that cattle or sheep for feeding are very scarce and high in price. Usually some of the sheep and lambs that come out from the mountain ranges in the fall are too thin for slaughter and must be sold at a lower price than the fat animals, thereby giving the farmer with feed an opportunity to market his hay and make a profit besides. Because of the abundance of feed on all of the ranges and everywhere else, stockmen report that all stock will come out fat.

Central California

Patterson, Stanislaus County, now proposes to have a cheese factory.

Green alfalfa in barn is charged with being cause of a $2000 fire loss.

Yettem, Tulare County, has been shipping Muscat grapes for some time.

Farm Adviser Mayhew of Madera County was installed in office last week.

Porterville, Tulare County, is shipping some of the new fall crop of lemons.

Several successful plantings of rice have been made in the section about Tulare.

Ceres, Stanislaus County, expects to ship out a carload of honey within a few days.

Alpaugh, Tulare County has shipped 65 carloads of beets to the sugar factory at Visalia.

Kingsburg, Fresno County, sometimes ships as high as seven cars of fresh peaches daily.

Kern County is moving for a $2,500,000 road bond to supplement the state highway system.

Watsonville's Bellflowers are now declared to be ripe and going to the market in large quantities.

Kern County has alfalfa claimed to be eight feet tall and running 12 to 14 tons to the acre per season.

Fruit growers of Ceres, Stanislaus County, are discussing cooperation in order to secure more just returns.

The San Joaquin Valley is shipping about 60 cars of grapes daily, the prices ranging from $1.15 to $2.00.

The Poultry and Pet Stock Association of Stanislaus County is perfecting plans for its show December 1 to 5.

The state highway between Fresno and San Francisco is being rushed and it is thought the line will be completed this fall.

A shipment of five carloads of steers was made to San Francisco recently by Rodden Brothers of Oakdale, Stanislaus County.

The agricultural club of the Dinuba high school has decided to make exhibits at the Fresno and Tulare county fairs this fall.

The first semi-annual convention of the Inland Waterways Association of California will be held at Stockton, September 24, 25 and 26.

The July report of the Tulare Cow Testing Association gives the highest herd average per cow in the association as 35.3 pounds of butter fat for the month. The highest individual record is 50.01 pounds of butter fat credited to a Holstein cow.

Fairmead farmers are now getting top prices for butterfat. Two creameries are collecting cream from the farmers; one is a cooperative creamery owned by farmers and managed by A. R. Bates. The creamery building has just been completed with the most modern equipment, sanitary in every way. Mr. Bates says the creamery will gather cream daily and will pay the highest market prices at all times and guarantee satisfaction. The other is the Sierra Creamery, owned by A. L. Sayre.

Southern California

Heber is to have a new cotton gin.

San Bernardino County is asking for a farm adviser.

Cotton in the Imperial Valley is by far the heaviest crop ever.

Orange County is engaged in its harvest of blackeye beans.

San Bernardino County is now talking of her need for a farm adviser.

The big new cotton gin at Calipatria, Imperial County, is now starting on the new crop.

The Order of Railway Conductors in this state has announced its opposition to the proposed eight-hour law.

Brush fires in the upper end of the San Fernando Valley of Los Angeles County have kept rangers busy the last few days.

Prices of lemons are said to be going up as heavier and heavier demands are made by the East for California fruit.

Cotton growers of Imperial Valley have appealed to Washington for a fiscal agent who shall advance money for crop operations.

Orange County reports walnuts beginning to drop. The crop is maturing a month earlier than usual owing, it is supposed, to the mild winter.

Imperial Valley is urging settlers along both sides of the Colorado to join with it in requesting government aid for protection from river overflows.

The Calipatria, Imperial County, creamery and ice and cold storage company is hoping for early construction of a plant, plans for which are completed.

The sugar factory at Chino, San Bernardino County, commenced its season's operations on August 15. There are about 6000 acres of beets in the Chino section.

The Palo Verde, Coachella and Imperial Valleys are now receiving power from the Sierra Nevada. This is said to be the longest transmission line in the world.

Incompetent dairy inspection is alleged to be the cause of the failure of the Calexico creamery and a strong movement has been started to secure careful inspection service.

Bean growers are pleased at the price of bean bags which the San Quentin state prison has recently made. They are being offered at six cents, while the Calcutta bags, which have been used, cost 6¼ and 6⅜.

Cotton picking is in full swing in the Heber district of the Imperial Valley. A large number of colored pickers have been imported from cotton plantations of the southern states. Because of the hot weather the men rest during the middle of the day, picking early in the morning and late in the afternoon.

Bean growers and threshers of Orange County are at war over threshing prices. Prior to last year the price was 25 cents per 100 pounds, and last year because of an exceptionally small crop a special agreement was made at 30 cents; this year the threshers want the increased price with an enormous crop to thresh.

The Coast

The Oregon wool clip will produce a crop worth $2,700,000.

Elberta peach day was observed at Hurricane, Utah, August 18-19.

The Yuma Valley of Arizona reports a fine crop of alfalfa seed.

The hop market at Portland, Oregon, is exceptionally strong at about 16 cents.

Crops at Pomeroy, Washington, are injured over 50 per cent by grasshoppers.

One of the biggest productive industries of Prosser, Washington, is cantaloupe growing.

Poultrymen of Washington are planning to organize a state association at the time of the Interstate Fair.

The Lewiston (Idaho) Apple Growers' Association will market its fruit through the North Pacific Fruit Distributors.

Yakima apples carried off a first prize at the International Apple Shippers' Show held in Boston the first of the month.

Heavy shipments of California cantaloupes are congesting the Seattle markets, which are already full of local melons.

Orchardists at Silver Lake, Oregon, are finding thousands of dead rabbits, thought to be the result of contagious disease.

Oregon hop growers are expecting to receive big prices on account of European hops being removed from competition by the war.

James J. Hill is distributing a bunch of 50 bulls throughout the Northwest. These are stock purchased in England by Prof. Shaw of Minnesota.

The North Pacific Fruit Distributors has increased its membership more than 1000 during the past month. Its membership now includes 7500 growers.

The Oregon state board of horticulture has arranged to have inspectors prepare comprehensive reports of fruit acreage and production in their districts to serve as a guide to fruit growers.

Alfalfa seed growers of Utah have secured the establishing of special frost stations and on warning of coming frost will cut. On account of the European war exceptionally high prices are anticipated.
